10 ORIENTATION--information especially likely to be needed by users of a file as a frame of reference for understanding the materials classified elsewhere; organization of the file, special coding decisions, and evaluation of the file.

GUIDE TO THE FX10 BUSHMEN FILE

[This file is concerned with the Bushmen who are today confined principally to the Central and Northern Kalahari Desert and adjacent districts in the Union of South Africa. They are a short, brownish-yellow people, with certain peculiar and distinctive racial characteristics. They live generally in small nomadic bands which lead a hunting and collecting existence. They speak a "click" language of the Khoisan linguistic stock. The file concentrates on the Kung (! kung) Bushmen, embracing the Agau, Nogau, and ǂkungau tribes, which belong to the Northern Branch of the Bushman subfamily of the Khoisan linguistic stock. Information on the Auen and Heikum Bushmen is also included in some of the sources processed. The Kung were selected as the sample group because they are much less acculturated than other Bushmen groups. Subheads are used throughout the file to indicate which group is under consideration in each source.

The file includes 16 sources, three of which are translations from the German (2: Kaufamnn, 3: Lebzelter, and 4: Werner). 9: Thomas and 16: Lee are the largest sources, but six articles by the ethnologist Lorna Marshall (1, 5, 6, 12, 13 and 15) with the volume by Lee form the basis of the file. 16: Lee is a monograph of Kung subsistence ecology based on fieldwork in 1963-1965. Each of the articles by Lorna Marshall, who did fieldwork among the Kung between 1950 and 1961, focuses on a different aspect of the culture, except for 15: Marshall which is a cultural summary, which should probably be read first. 1: Marshall addresses Kung marriage, 5: Marshall the kin terminological system, 6: Marshall power and weather beliefs, 12: Marshall social control

and relief of tensions, and 13: Marshall religious beliefs. These detailed sources are complemented by 9: Thomas, a travel book which gives a good feeling for Gikwe and Kung social relationships. Among the earlier sources (i.e., those whose field date precedes 1920), 2: Kaufmann (on the Auen) gives a good general ethnographic survey of Bushmen culture; 3: Lebzelter also surveys Bushmen culture, including the Kung and Nogau; 4: Werner analyzes Heikum and Kung physical anthropology and culture; and 8: Fourie gives a general summary account of Bushmen culture. 7: Story is a general ethnobotany of the Bushmen; 10: Bleek discusses kin terminology and linguistics, and 11: Marshall (John Marshall) is a good account of Kung foodgetting. 14: Willet is a general bibliography of the Bushmen, covering three centuries of publications. This a generally good file for comparative purposes, with most of the categories having data available. More information should be available in the future when the results of the Harvard University expeditions of the 1950s and 1960s are fully published. Researchers should be specific when making comparisons because of the differences in acculturation between the various Bushmen bands. The file was processed between 1960 and 1973.]

MARRIAGE AMONG /KUNG BUSHMEN

LORNA MARSHALL

101 BECAUSE within the area we indicate by shading on the map[1] the /Kung Bushmen intermarry among themselves, by custom and preference, members of the Harvard Peabody Smithsonian Kalahari Expeditions needed a convenient way of referring to that area as a unit and arbitrarily called it the region of Nyae Nyae.

Nyae Nyae is a corruption of the /Kung name //Nua/ei. The name Nyae Nyae refers 131 strictly to a group of pans in South West Africa (S.W.A.) centred approximately at Gautscha Pan at about 19°48′30″ S, 20°34′36″ E. We extend the application of the name to an area around the pans of about 10,000 square miles, lying for the most part

[102]

Map of portions of South West Africa, the Bechuanaland Protectorate and Angola. The shading marks the Nyae Nyae region.

in S.W.A. but reaching some miles over the border of the Bechuanaland Protectorate (B.P.). There are no strictly conceived boundaries around the area. We can only vaguely define it by saying that it does not include Karakuwise to the west or Chadum to the north. It does not, we think, reach eastward much farther than Kai Kai, or southward much beyond Blaubush Pan (40 or 50 miles south of Gam).

101 We establish the periphery of the region on the basis of statements made by 582 /Kung informants in the interior. They say that they intermarry among the bands [131] which live within the area we describe and do not customarily marry with other

[1] The sketch-map here provided is based on the [102] National Geographic *Map of Africa and the Arabian Peninsula*, March 1950, and the *Times Atlas of the World*, Vol. IV. The orientation of Gautscha is taken from the S.W.A. Surveyor-General's map dated at Windhoek 7:11:35.

Kung

101 Bushman language groups, Auen, Naron or /Kõ, to the south, or with other /Kung
582 whom the Nyae Nyae /Kung know to be living to the north-east and north-west of them.

619 The S.W.A. and B.P. governments administer the region as it lies within the
[648] territory of each but not as a unit in itself. The /Kung have developed no internal political organization to unite their bands. The unity of the region exists, in so far as we know, only in the minds of its /Kung population and in the fact of their intermarrying and being held together in a net of kinship and affinity.
648

162 About 1,000 /Kung live in the region. Roughly three-quarters of them live in 28
[621] bands and are nomadic hunters and gatherers with no agriculture, herds, or beasts of burden. Approximately another fourth work for Chwana and Herero on their cattle posts on the periphery of the region. Most of these still have connexions with the interior bands and intermarry among them. In the interior there are no inhabitants
[177] other than /Kung, and no European or Bantu institutions modify the old /Kung way of life.

621 My study of /Kung marriage regulations is based on data derived during the
[114] years 1952–3 specifically from 14 bands with which we had the most contact and on which we gathered considerable genealogical material. These bands varied in size from 8 to 57 persons, averaging 25, with a total of 353. The marriage status of these persons as of 1952–3 is given in Fig. 1.

[162] FIG. 1. *The Marriage status of a sample of 353 persons*

Married men (9 of them had 2 wives)	88
Wives of above men	97

Young widows	2
Young divorced women	2
Unmarried boys, adolescent and younger	78
Unmarried girls, adolescent and younger	58
Total	353

601 /Kung social organization is of the 'Eskimo' type, as defined by Murdock.[1]
[595] Theirs is the sub-type, which varies from normal Eskimo in that polygyny occurs and
[596] extended families are common instead of independent nuclear families in neolocal
[611] residence. Other characteristics are normal Eskimo. Descent is reckoned bilaterally,
[614] There are no exogamous unilinear kin groups. There is bilateral extension of the
[835] incest taboo. Cousin terms[2] are the same for cross and parallel cousins and cousins are differentiated terminologically from siblings. One term is applied to both FaBr and MoBr, another to both FaSi and MoSi, and these terms differ from the terms for parents.

621 As we examine their rules of exogamy we find that the band is not an exogamous
582 unit as such. Actually most members of the band are so interrelated by consanguinity or affinity that the marriage regulations strictly prohibit their intermarrying,

[113] [1] G. P. Murdock, *Social Structure*, Macmillan Co., 1949, pp. 223, 226–8.

[2] For the terms and for special features of the system see Lorna Marshall: 'The Kin Terminology System of the /Kung Bushmen', *Africa*, vol. xxvii, No. 1, Jan. 1957.

1:Marshall E-5 (1952-1953) 1959 FX10 Bushmen FX10
Kung

but there might very likely be some between whom marriage would be permissible, such as, for instance, a man and his WiSi or his widowed BrWi. 621 582

The /Kung have no unit within which endogamy is absolutely required. Those of the Nyae Nyae region almost all marry among themselves within the region, not because a formulated social rule definitely prohibits their marrying outside but because they almost never go out. They do not like strange places, strange situations, or strange persons, and have no way of feeding themselves where they cannot depend on receiving food from relatives or friends and, in strange country, either do not know where the wild foods grow or might not be allowed to gather them if they found any. Nevertheless, a few Nyae Nyae /Kung have married other /Kung outside the region, and one /Kung woman we know is married outside her own race, with acceptance and ease of relations all around among her people and his, to a Chwana man at Gam, near the southern border of the region. We think in all probability there must be other mixed marriages along the Bechuanaland border which we do not know about, but we are safe in saying that among the Nyae Nyae /Kung such marriages are rare. [648]

Prolonged intermarriage within the region has woven these people together and much visiting among kin develops acquaintanceships and friendships which unite the whole Nyae Nyae /Kung population. They feel themselves to be an in-group and express this feeling in the words *ju /ɔ̃assi*.[1] *Ju* means 'person' or 'persons'; 571 619 621

[1] S. Passarge puts the phrase on his map in *Die Buschmänner der Kalahari* (Berlin, 1907, Dietrich Reimer, p. 19), spelling it *Sw'gnassi*. He places it on the line of 20° S., slightly to the east of 20° E., near what we call the centre of the Nyae Nyae region, in the area designated on his and other maps as the Kaukau Veld. He places the phrase as if it were the name of a Bushman group, like Heikom, Naron, or some other, He places the name *'Kung* somewhat to the north-west. That is the name we spell */Kung*, which D. Bleek (*A Bushman Dictionary*, American Oriental Society, 1956, p. 447) records as */Kũ*, */Ku* or */Kuŋ* (person, Bushman).

Passarge places the name *'Kung* once more at about 23° S. as the name of another Bushman group. In sound the name is the same or very, very like the name of the more northerly group. Miss Bleek refers to this group as being popularly called 'Koon'. L. F. Maingard distinguishes between the two by spelling the name of the southerly group */Kɜ̃*. The /Kɜ̃ are to be found in B.P., in and south of Okwa. Whereas the /Kung language has four clicks (symbolized now as dental /, alveolar ≠, alveolar palatal /, lateral //), the /Kɜ̃ language is very different and has a fifth click, that of the southern Bushman language groups, the labial ⊙. The phrase *ju /ɔ̃assi* has nothing to do with the /Kɜ̃.

Maingard in 'Three Bushman Languages' (*African Studies*, 16/1, 1957, p. 37) uses the phrase as the name of a dialect of /Kung—'. . . *dyu/ʔɔ̃ã:si* (Northern Group, a dialect of /khũ, partly in South West Africa and partly in the Bechuanaland Protectorate)'. Bleek (op. cit., p. 334) does not record the phrase in /Kung (her northern Group II), but gives it in Auen (N I) and says it means 'Bushman'. She spells it *ju /mwasi*. [101]

We think that the phrase *ju /ɔ̃assi*, which we started spelling in this way because we did not know any better and continue because it is simples, can be applied to groups of varying size and definition, on a variety of bases, when the in-group quality in comparison with the out-group is to be expressed in some way. When we asked what they call themselves, our /Kung informants often replied '*ju /ɔ̃assi*' as though the phrase might be coextensive with Bushman as distinguished from non-Bushman (Europeans, */ku*, whom the /Kung also call 'red people', i.e. *ju gau*; or Bantu, whom the /Kung call *ju dzo*, 'black people' or */gema* (or */koma?*),' animals without hooves'). They also use *ju /ɔ̃assi* when one might expect them to say '/Kung' as distinguished from other Bushman language groups, or when they distinguish themselves from other /Kung outside their region. They said that the Makaukau (Auen) Bushmen to the south were *ju dole* and they know that the Bushmen at Karakuwise, Nuregas, and Chadum speak /Kung but said they were *ju dole* nevertheless. I had the impression that it was the out-group quality in the phrase (strange and therefore potentially harmful) which was being expressed when they applied it as above and claimed that the Makaukau were a murderous people who have a medicine so deadly that you die if you but glance at it, and that those Nuregas /Kung put poison into the pipes they give you to smoke. One's friend or relative can also be *ju dole* if one is displeased with him.

Isaak Utuhile (a Chwana chief under Queen Moremi, in Kubi, B.P.) said that in the phrase *ju /ɔ̃assi*

/135 cont./

144 (Ngamiland): "I should like to observe briefly that the Kalahari
197 Bushmen are low in my estimation, both in respect to their language and to their appearance; I was able to confirm an extremely close relationship with the Nama [Hottentot], but in an old dialect no longer spoken today."

Since I lack the knowledge for making anthropological
141 measurements, I shall confine myself to /136/ presenting several ǂAuin types as I observed them. They may not be without value for comparative purposes.

I should like to add that in measuring physical height I obtained the following results:

Adult men (between 20 and 40 years of age)

Average	1.51 1/2	meters
Maximum height	1.62	meters
Minimum height	1.47	meters

Adult women (between 20 and 40 years of age)

Average	1.45 1/2	meters
Maximum height	1.53	meters
Minimum height	1.38	meters

A. Geography and Statistics

The ǂAuin, as they call themselves and as they are known to
131 the neighboring Bushmen tribes, inhabit that part of the central Kalahari which is more or less immediately bounded by the watering places Rietfontein, Ganab, Gam, Sidonitzaub, Otjiamangombe, Tjumda, Epukiro, Oas, Stampriet, Rooigrauwater, and Habakobis. Their territory lies for the greater part within the boundaries of the German protectorate. The adjoining sketch indicates as accurately as possible the geographic location, as well as the approximate territory of the neighboring Bushmen tribes. The
101 Hottentot designate the ǂAuin as ǂAu-San (Schinz), the inhabitants of the Chanse Veld as ǂAukwé (Passarge), the Betschuana [Tswana] as Makaukau. The approximate number of Auin (1),

[104]

1. For the sake of simplicity I shall from now on omit the initial mark ǂ, which indicates the click.

ANGOLA !KUNG WESTERN OTJIMPOLO VELD

[6 cont.]

105 In their religious ideas, the moon plays the chief role. The new moon is supposed to be a child or a man; the full moon, a woman. They also say that the moon is the older sister, and the sun, the younger sister. Besides the moon, Huwe and //Gaua appear as mythical personages. Instead of Huwe, they also say //Nwa-se, "little new moon." Bleek believes that Huwe is the spirit of the forest, who causes the growth of trees and grass and thus also the growth of game, therefore determining the success or failure of the hunt. Whether or not Huwe is worshiped could not be determined. It is interesting to note what is said concerning //Gaua: "//Gaua is another being. The people from Ngami Lake give the word three meanings: dream, ghost, spirit. Among the Angola Bushmen it is used sometimes for ghost, and sometimes more impersonally. A woman said: When a person dies, a ghost (//Gaua) comes from his grave, which can be seen by the medicine men." Thunder and lightning come from //Gaua. The person struck by lightning becomes a star in the sky. The stars are the campfires of //Gaua. The Bushmen are supposed to be the children of //Gaua. He is a man who lives in the forest, and his home is a hole in the ground. An informant explained that //Gaua is equivalent to Ndjambi (god). There are two kinds of medicine men: those who can see the spirits, conduct the boys' initiations, and do the tattooing, while the second kind cures the sick.

Chapter 2

The Bushmen of the Western Otjimpolo Veld

122 In Shandi, among the eastern Ukuanjama [Kuanyama], I was able to establish contact with the Bushmen through the kindness of the Resident, Mr. Eaddes, and of the native pastor, Paulus.
101 In part, these Bushmen were genuine !Kung, who said they were the same as those from Karakowisa, with whom, however, a fruitful understanding was impossible; and in part they were people who called themselves !Kung, but, judging by their language and customs, are southern Bushmen of Amboland. They themselves say that their fathers came from Ongandjera. The following

[6 cont.]

101 account refers only to the latter.

821 [7] The sky is designated by them as !nanu áiba Éroba Kharésa ("rain house of god").

776 For god they have the expressions "Erob" and "χ'amab"
775 only "Erob" is used in prayers. χ'amab (1) has been preserved

1. χ indicates a very low gutteral click, for which I know of no notation.

in χ'amá //gu Khe = "people who are with god," in other words, the souls of the deceased in heaven. Everyone goes there, the good as well as the bad. Erob has no wife and no children. A human being has only one soul (!gau-ba). This soul goes to the heavenly house and remains there "until Erob makes new people from it." Here is a belief in the transmigration of souls, which, it must be admitted, is not thought through any further.

No spirits of the dead remain on earth. There are little
776 bush spirits, the gangorob; they are harmless and do nothing. There are no evil little spirits. They supposedly know nothing about Heiseb and /Nawa.

136 The supply of game is ample in the tall dry forests of the Otjimpolo Veld. There are also fish in the rainy season. The
[825] Bushmen call them "shiba" (Ovambo: oshi or ochi); in other words, originally they had no word for them.

224 The Bushmen are helpless against the lion (χ'oréba).
[825] They leave a region as soon as lions make it unsafe. "There is no point in hunting them."

The leopard (χ'nába) is hunted with dogs (ariba). The
[439] chiefs of Amboland pay a good price for the skin, since little princes and princesses are not carried in a litter made of cowhide, but in a leopard skin. The jackal (≠Khai-eba) and the Löffelhund (//arúba) [a fox-like wild dog of the subfamily Octocyoninae] are hunted with enthusiasm. "Aruba" probably corresponds to N. //arob = striped jackal.

Wild dogs, "Khere," !nube (N. !goub) are preferably
[825] avoided. No notice is taken of the hyena, ≠Khai-lasa (N. ≠heirab),
[262] and it is not eaten. When they come near the camp, it is not a
[767] good sign.

[9 cont.]

805 shauba, cold season (N. sáob).

!kn-aba, hot season (N. !nái, warm).

535 Among dances, an ostrich and an ape dance were mentioned to me.

123 The studies, which began so promisingly, came to an end because I was evidently unable to present the village chief with enough presents. One evening a boy appeared and told me that the Bushmen had "had to go hunting." I continued to wait a number of days for the !Kung called by Mr. Eaddes. The messengers returned with the news that they had found no one. Another Sunday coat for the village mayor and some yellow money for the Bushmen, and priceless material could have been obtained.

[107] Chapter 3

The Dama Bushmen from the Palm Bush East of the Ondonga [Ndonga]

173 According to their tradition, these Bushmen came from Herero country. Hence they represent the connecting link between the "Saan" in the Gobabis district and the Hei//om [Heikum] of the north. The people as a whole designate themselves as Daman = the wealthy. The horde around Oshigambo calls itself //Huru-Khái. They call their dialect Cháraba. I do not believe that they live far in the interior of the Otjimpolo Veld. They have an enormous respect for the !Kung. The outermost cattle posts of the Ondonga probably coincide pretty much with the boundaries of their territory. A number of them are Bantuized and have small physiques. The others engage in hunting and supply the black farmers with the flesh of wild game, hides, ostrich egg beads, and poison. They serve as beaters on the great hunts of Chief Martin. At the court they count for nothing. The farmers like to see them. Little acts of assistance, a sack of berries or veldkost, soften the heart of the black housewife, so that here, as in Uukualuthi [among the Kualuthi?], there are a number of do-nothings who are nonetheless gladly received.

101 131 172 142 439 648

[13 cont.]

Chapter 4

The Bushmen of Ukuambi

115 At an outpost of the Finnish Ukuambi Mission, where I undertook anthropological measurements, I encountered a Bushman from the hordes that live on the northern bank of the Etosha Pan and stand in a loose dependent relationship partly with Ipumbo, partly with Shanika. I was able to converse with him only a few hours.

101 These Bushmen in Ukuambi, as well as at other places, belong to the Ezimo of the Akuanambua. They themselves are [614] divided into a number of exogamous kin groups. My informant belonged to the clan Ari-Ari. The tribe calls itself Akese or Kere and comes from the region between Okaukuejo and Outjo. Today this tribal organization is broken up. The following names -- formerly independent hordes which now live mixed together -- were mentioned to me: /Aru-Kwe, Ashuche, Asécha, !Kuru-Kwei, A !Kha-ta-bé, A-Hei-tére, A !gnuri.

648 Insofar as these Bushmen do not already lead the life of the Bantu farmers, they are hunters, spies, and occasionally also executioners for the chiefs. They manufacture ostrich egg beads [+39] and poison. For twelve good ostrich eggs they receive a fat ox. The Ovambo have quite a peculiar outlook in this respect. They spurn the perfectly good eggs of their hens. The ordinarily somewhat "disreputable" ostrich eggs are purchased for dear money as a delicacy.

611 The sons belong to the family of the father, the daughters to that of the mother. The men are not allowed to eat hares, 262 but the women and children do. The eating of hyenas and boa constrictors is prohibited to all.

776 Concerning their religious conceptions I was able to discover the following: In the sky dwells the great captain !Khuwa, which means the same as Huwe. In answer to the question about God, however, he stated that this was Erob, which naturally coincides with the name for God, Ellob, of the Rhenish Mission. The name !Khuwa only occurred casually in the conversation. He was unable to give a clear answer to my question as to whether

[13 cont.]

776 !Khuwa and Erob were the same. In any case, the expression Ellob used by these people comes from Outjo, where there are a number of Christian Bushmen.

!Khuwa lives in the heavenly house χ'ain !nao gároba.
[772] The people in heaven eat only large flies, !Khu !Khua-i. The figure /Nawas is unknown. The evil antagonist of Huwe, //Gauab, is also absent. These Bushmen, however, have the same doctrine
[774] of the two souls as the !Kung of the east.

775 When someone dies, he becomes the property of !Khuwa; he is a !Khunga. The actual soul, χ'aobe, goes to the heavenly house, remains there, and does nothing but eat large flies. From the bodies of the dead [14] arise the //gauá-i, which run around in the bush and stir up trouble. They correspond to the akwapungu
[171] and azizi of the Ovambo. "But the actual souls of the Ovambo and the Bushmen go different ways; those of the Ovambo go under the earth where they have their fields and herds, but those of the Bushmen go up." Since the missionary Mr. Kylves expressed the desire to make some detailed studies of the Bushmen himself, I gladly left this attractive field of study to my kind host.

197 Finally, a number of words indicate that these people
192 are to be included in the Hei//om-Nama group, a point which
[101] is very striking with respect to the !Kung elments in their world view.

[16 cont.]

[134] 137 saturation and ground water, is a dry forest of a different type which corresponds to Warburg's lowland forest and, in contrast to the light dry forest of the looser sand, is distinguished by a relatively high density. -- The dry forest steppe occupies the largest areas of the !Kung Veld, and [17] lowland forest and grass steppe form only modest enclaves in it. Within the dry forest, at those places where the nature of the terrain makes possible the accumulation and preservation of relatively significant quantities of water or ground humidity, there are individual trees that are to be regarded as remnants of a former compact lowland forest, and the floristic composition of such forest islands leads to the conclusion that the entire region, with the exception of the primary grass steppes, whose floor probably never displayed taller vegetation because of its sterility, was once covered by a lush lowland forest as is preserved in its finest form at present in the northern Kalahari and in the 'rain forest' of Victoria Falls."

101 [131] By the !Kung Bushmen in the narrower sense, who are divided into a northern group and an eastern group, I refer to those people who are located north of the police zone and south of the Okovanggo in the effluent region of the Omuramba u Owambo at the Löwenomuramba and on both sides of the lower and central Omuramba u Omatako. The groups in the source region of the Omuramba u Owambo have been studied by me in 174 greater detail. In former times, the !Kung undoubtedly lived much farther south and west. It is not improbable that they left the Grootfontein plain and the Otawi mountains under the pressure of the Hei//om, who in turn were forced out of the central region by the Herero. On the other side they undoubtedly gained space toward the south, for according to reports from the pre-war period, the Nogau were settled in the Sand Veld all the way to the vicinity of Otjituo, whereas today they have retreated 144 behind Alexeck. The racial composition of the !Kung Bushmen allows one to make a conclusion about their history. Among them we find a larger number of Europoid types than among the surrounding Bantu tribes. In addition, Austroloid influence is

[20 cont.]

648 put themselves under a chief, a Herero half-breed named
621 Krüger, whose position was acknowledged" (see p. 87). "In
622 Naidaus a Bushman leader named Aribib introduced himself, who, like Krüger in the east, was recognized as the captain of the Bushmen in the west" (p. 88).

114 "During the journey of Captain Volkmann in the year 1902 to the Okovanggo, the !Kung Bushmen provided extensive help. Volkmann describes these !Kung in the following manner:
147 'The Bushmen, who are almost totally naked, are very sensitive to the cold. In the morning each Bushman has a burning log in
372 his hand, which he holds close to his chest. The other hand is placed on the shoulder with the upper arm pressed close to the body. At the resting place the log is used immediately to make
481 a fire. When a Bushman walks in front of the horse as leader, he
222 springs with incredible speed, now here and now there, to get a tuber or root out of the ground. Various berries growing on low
276 shrubs are also very popular. Anything that can serve is used as a tobacco pipe: kudu horns, calabashes, hollowed fruit of the Strychnos, old metal cartridge shells, and so forth. Most of all they like to smoke through water, which is never renewed. When they run out of tobacco, they boil the bark of a tree in the thick tobacco water, dry the bark, which has some tobacco taste, and smoke it' " (p. 180).

101 F. Seiner reports the following concerning the divisions
13) of this tribe:

"The Kung, to the best of our present knowledge, are divided into four groups. The western group seems to extend from the Portuguese border near Kurinkuru along the route via Tschitschib to the Omuramba u Owambo and then seems to be bounded by the latter and in the east by the line Nuragas--Blockfontein. The Karakuwisa group bordering them to the east inhabits the valley of the Omuramba u Omatako from Karakuwisa to Blockfontein during the dry season, and during the rainy season also the steppes 100 to 150 kilometers east and west of the Omuramba and the latter itself up to the Kanovlei. The more southerly group extends from the latter in the Omuramba to around Osondema; we shall call these Nog-au, who have already settled in the central Kalahari and can scarcely be classed with

[20 cont.]

101 the half-breed Bushmen, the Otjituo group. The Gam supposed-
131 ly dwell in the region west of the Omatako valley from Okanakasewa to Omambonde. The most serious complaints are
[648] lodged against the western group, which, in the opinion of the
[631] District Office, is for the most part under a single head chief, the notorious Namagorub, and is called !Kung-au (that is, !Kung people) by the other Bushmen. The Karakuwisa chiefs, Gnani and Ma, both crippled, are worth mentioning, and further, the leaders of the burglars of Blockfontein, Gachu and his brother Tamburi; no one, however, has as much power as the notorious Namagorub."

According to Vedder, the Bushman tribe of the Masi-
[197] Keren live in the forests south of the Otjimpolo Veld. They do
[342] not understand the !Kung language; they live communally in
[301] large rectangular houses and make incisions in the upper thigh
[827] in order to be able to run better. Their arrows have large iron
[411] points that are not poisoned.

2. On their Character

157 In character, the Bushmen differ among themselves just as much as the members of any other people. The various types of disposition already point to this fact. In view of the relatively brief period that I was able to spend with the individual Bushmen, I do not want to give too much significance to individual characteristics. The character of a people, if one can speak of such, [21] manifests itself in the average conventional or traditional kind of reaction in different situations, and, in spite of the physically conditioned differences in character, this kind of reaction nonetheless displays a certain broad uniformity.

Since among the other Bushman tribes my observations
[114] were less detailed, I shall report everything worthwhile that I observed here.

When he is confronted with something new, the Bushman at first acts relatively uninterested. He has little curiosity. On the other hand, two !Kung Bushmen did once demand of me a detailed explanation of the motor, and they listened patiently to my account. When an American once gave a phonograph concert, they listened to it with obvious pleasure, but none of

[64 cont.]

600 the beyond one acts the same as on this earth. Like the Namib
769 Bushmen, they throw little stones on the graves and at the same time pray that the spirit of the deceased may bring them luck (Dornan, op. cit., p. 146).

787 Conceptions concerning dreams are tied in with the Lulu
[774] doctrine of conscience. In a dream the other self speaks with the dreamer, and this may be good or bad. The other self may be influenced by enemies and thus do harm to the twin soul.

According to Dornan, the Bantu adopted the oracle sticks from the Bushmen. Every Masarwa carries four or five pieces with him. The female pieces are longer and narrower than the
[825] male pieces. They are made from the hoofs of small mammals,
[824] from wildebeest bones, and fruit kernels. The names of the four sticks are: Chowe, Kao, Daua, Gaichwe. The Masarwa believe
[776] that [65] Thora and Huwe, and perhaps also Khauma, speak through these bones, and Mackenzie (1) states that the Bushmen

[113] 1. Ten Years North of the Orange River, p. 136.

had designated these bones as morimo aa'me (things of God).

The shoulderblade of the springbok is also used for divination by the Masarwa.

606 Among the Masarwa the mother-in-law may not look at
551 her son-in-law and may not mention his name. The wife may say
602 neither the name of her husband nor the names of his relatives.

Finally, concerning the Swamp Bushmen of the Okovonggo
105 delta, J. Seiner reports:
101 "The Tannekwe have summer and winter villages, as well as boats and goats, and engage in agriculture, fishing, and hunting.
[563] The latter occupations are practiced by the pure Bushmen, whereas half-breeds and the pure Mambukuschu, who were stolen as children and reared by the Bushmen, occupy themselves with agriculture and subordinate tasks.

"The number of racially pure Bushmen among the Tannekwe
[144] may be as high as 60 per cent, but as a result of the slight increase of true Bushmen, which they try to equalize by stealing the Mambukuschu children, they are undergoing a steady decrease.
AND RACIAL MIXTURE IS PROGRESSING RAPIDLY.

OKOVONGGO BUSHMEN
NOGAU

[65 cont.]

000 and racial mixture is progressing rapidly. The Bugakwe live in
105 five villages with 220 persons in the western Okovanggo Valley
[161] down from the Mahango ford and are in bondage to Libebe, with
101 whom, however, they frequently have quarrels over the amount
131 of deliveries; on the occasion of one such dispute in June, 1905, a Mambukuschu was killed by an arrow. The Garikwe live in
[161] eight villages with 430 souls in eastern Ärmellande from the Paliba Swamp to the beginning of the valley, while the Goekwe live in southern Ärmellande west of the river course. Concerning
[161] the latter, I found only a winter village with 90 souls, and that north of the mouth of the Namassere on a river island.

"The Goekwe might well be identical with Passarge's Gokwe, whose territory extends from the western edge of the Tauche swampland deep into the Kaukau Veld; the Tschorilo Mountains belong to them. During the rainy season the Tannekwe undertake hunting expeditions in the neighboring steppes. The Hukwe, whose
[161] number I estimate at at least 600, are less racially mixed than the Tannekwe, but likewise live in settled villages, from which during the dry season they swarm out in family groups to gather or hunt in the forest steppe as the need arises."

Chapter 8

The Nogau Bushmen of Epukiro

101 During my stay in the mission station of Epukiro, I had an opportunity for closer contact with the Bushmen who live in a kind of symbiosis with the Betschuana (2). They call themselves Nogau,

[113] 2. I have given a detailed report on the Europeanized Betschuana village of Epukiro in Zeitschrift für Ethnologie, Vol. 65 (1933).

specifically ǂno /gna !khou, that is, people who live by the water.
101 They are farther north of the Omuhamba Epukiro toward Alexeck.
131 North of them are the Gai-kwe, and the !Kung are farther east and

[65 cont.]

101 north. Beyond this there is a great river and many black people
131 (Okawango). They know only the Herero as their western neighbors. In other words, they came much later than the latter. Unquestionably as recently as 20 years ago some people of this group were still settled along the central Omurambo Omatako, where F. Seiner reports them from Otjituo and Nuragas. The Naron live south of them, and to the southeast the ≠Auin. In the southwest, at least formerly, there were Bushmen of the Hei//om group and /Gowanin (Sand Kaffir). Probably these Hei//om were the people formerly designated as Saan. Nogau, ≠Auin, and Naron actually belong to
[101] the Kalahari group. Throughout the farm zone which formerly
[175] extended to the English frontier, the tribal units were more or less
648 destroyed, and there arose a mixed Bushman population which constantly replenished its numbers from the free tribes. On the other hand, however, Bushmen from the farm zone always went back to the bush, partly of their own free will and partly in flight from the police. In the Gobabis district the boundary of the police zone coincides with the land boundary. The relationships between the Whites and the Hereros on the one hand, and the Bushmen on the other, are therefore [66] very tense. A few years ago,
175 648 after the Bushmen had been prohibited from hunting big game, they rebelled and declared a feud against the magistrate in Gobabis by shooting some arrows against the door of his house one night. The magistrate, Van Rynefeldt, wanted to hunt them down in the bush, but was struck by a poisoned arrow shot from ambush and died. A great roundup of Bushmen was organized and many of them were taken to the prison in Gobabis, where a number of them died as a
[178] result of the vitamin-poor diet. Since then the Bushmen in this region have again chosen a chief and represent a modest power. As a result of these conditions, it was much more difficult to gain
123 their confidence than in the north. In this respect, P. Watterott and the village mayor of Epukiro, Franz Arenat, were especially helpful to me. These Bushmen are of special interest since there
198 is a special women's language among them. It is called Hee-aziba he auseashu. It is in part also spoken by the children and is characterized by having many words that have no clicks. It was only with great difficulty that I was able to take down a few words, for example:

/241/

000 Anthropological, Ethnological, and Ethnographic Observations concerning the Heikum and Kung Bushmen (1), with an apdix on the languages of these Bushman Tribes (2).

1. Presented at the session of November 18, 1905 /of the Berliner Gesellschaft für Anthropologie, Ethnologie und Urgeschichte/.

121 2. The linguistic notes on the language of the Heikum Bushmen were gathered on the Omuramba Omatako, while the linguistic notes concerning the Kung Bushmen were taken down in a Kung settlement on the northern edge of the Kaukau Veld, approximately 15 kilometers west of Dobe.

A stay of several months in the vicinity of a Bushman settlement near Otjomavare, a watering place on the Omuramba ua omatako, about 50 kilometers south of Grootfontein and 120 kilometers northeast of Waterberg, gave me the opportunity to make a series of observations on the Bushmen, which, I believe, in part presents new information and in part complements and confirms what is already known. My first concern was to determine the size of the Bushmen, who are traditionally known as abnormally small, by obtaining absolute measurements. A closer acquaintance with this interesting people then led me to make further investigations that will be of interest to the ethnologist and the ethnographer.

I had to manufacture in part the instruments needed for making the anthropological measurements, but I hope that this circumstance has not diminished the accuracy of the results.

101 The Bushmen concerned call themselves "Heikum" people, a
[194] name in which the 'k' is to be replaced by the click indicated in
the Nama language by //. Thirty-one adults and eight children
124 were measured.

Of the adults 14 are men and 17 women.

128 I shall first present the average values of the absolute measurements, and then a number of proportional figures and indices.

AFRICA

JOURNAL OF THE INTERNATIONAL AFRICAN INSTITUTE

VOLUME XXVII JANUARY 1957 NUMBER 1

THE KIN TERMINOLOGY SYSTEM OF THE !KUNG BUSHMEN

LORNA MARSHALL

THE Peabody Harvard Kalahari Expedition, under the leadership of Laurence K. Marshall, has made four field trips between 1950 and 1955 into the Kalahari Desert in South West Africa and the Bechuanaland Protectorate to find and study Bushmen who were living in their own way, and not working for white farmers or for Negroes. The last of the four expeditions, that of 1955, was sponsored by the Smithsonian Institution as well as by the Peabody Museum of Harvard. 121 122

Our principal study was made with the /Kung Bushmen of the Nyae Nyae region of South West Africa. The Nyae Nyae region extends about 150 miles north and south, about 100 miles east and west, and is centred approximately at Gautscha Pan, which is located at *c.* 19° 48′ 30″ S. and 20° 34′ 36″ E. on the map of a survey of the area by the Administration of South West Africa dated 7.11.1935. The Nyae Nyae region is separated from the farmed areas of South West Africa by a stretch of waterless, uninhabited country over 100 miles wide. 131

We chose the /Kung of the Nyae Nyae region for concentrated study because they are the least acculturated Bushmen we found.[1] They are non-literate, nomadic hunters and gatherers, with no agriculture or domesticated animals. They are completely [121] 105 177
self-reliant

[1] On the expeditions we travelled extensively in South West Africa and the Bechuanaland Protectorate. The groups of Bushmen we encountered were, in addition to the /Kung of Nyae Nyae, /Kung outside the Nyae Nyae region at Karakuwise, Nuragas, Khadum, and at water holes south of Gum in South West Africa, and at Kai Kai, Kubi and other places along the western border of Bechuanaland, where Chwana and Herero have cattle posts; Makaukau and Naron near Ghanzi, B. P.; /Kõ at Okwa and at Barachu, about 50 and 100 miles south of Ghanzi respectively; /Gikwe about 100 miles south-east of Ghanzi in the trackless sandy plain that lies between Ghanzi and Molepolole, where during the dry season there is no water; and //Ganakwe still farther south, below Chukudu. We studied the kinship terminology of the /Kõ and /Gikwe; Professor L. F. Maingard, for a time a member of the 1955 expedition, studied the /Kõ language, which has the labial (fifth) click of the southern group. [101]

Professor I. Schapera and Miss D. F. Bleek, in their Bushman studies, record information on these groups. For more data on the various names by which the groups are known and the areas in which they were found and the language groups into which Miss Bleek's studies place them, see especially Schapera, *The Khoisan Peoples of South Africa*, New York, 1951, pp. 31 ff., and Bleek, D. F., 'The Distribution of Bushman Languages in South Africa', *Festschrift Meinhof*, pp. 55 ff.

'Africa', the Journal of the International African Institute, is published by the Institute, but except where otherwise stated the writers of the articles are responsible for the opinions expressed.

[p. 1]

173 Of migration of the Bushmen from elsewhere no mention is made in local native traditions. The Hottentots, Hereros and Ovambos state that on their arrival the Bushmen were found in occupation and that the latter must have been living here ever since the creation of man. The Bushmen likewise believe that their present tribal divisions and dis- [173 82] tribution have been in existence since the very beginning of things when each tribe had its origin in a "first big Bushman" and a "first big Bushwoman" of its own by whom were handed down to their descendants the practices and customs still peculiar to and the territory still occupied by their respective tribes. Each of the existing tribes with its constituent elements is consequently looked upon as having been "born" in and having been in occupation of the same area from time immemorial. Although claiming descent [174 53] from the aboriginal race they have lost all knowledge of the arts of painting and engraving. The rock paintings and carvings left by their ancestors are considered to be the works not of man but of the "devil."

174 The view that the present day Bushmen are composed of the remnants of their race driven back by the advance of stronger invading races from the north and south is not borne out by evidence arising out of recent investigations into the life and customs of this primitive people.

Distribution.

101 With the exception of a few isolated remnants on the north 131 bank of the Orange River and along the edge of the Namib desert, the Bushmen are confined entirely to the Kalahari along the eastern and north-eastern borders and to the northern portions of the territory which adjoin Ovamboland.

The Bushmen of the Kalahari region consist of three main divisions, each speaking a language of its own, viz.: the *|Nu-||ẽin* or *|Nu-sau* in the south, the *Ngami* Bushmen in the centre and the *Kaukau* Bushmen in the north.

The *||Nu-||ẽin* inhabit those portions of the Gobabis, Gibeon and Aroab districts which lie to the east of the Elephant and Auob rivers. The northern limit of their distribution is formed by a line running roughly from Naunas across Oas to the Elephant's River, crossing the Nosob a short distance below the junction of the Black and White Nosob Rivers.

The *Ngami* Bushmen are composed of a good many tribes who inhabit a considerable portion of the Bechuanaland Protectorate. In South West Africa they are represented by only a few groups of the *||Aikwe* tribe. These groups are known as the *Naron* and are distributed along the banks of the Chapman River as far as Oas.

The *Kaukau* Bushmen inhabit the greater portion of the Omaheke, including a part of the Kaukauveld and the

Oschimpoloveld. On the east they extend into the Bechuana- /01
land Protectorate and on the north into Angola. Among /31
them are included the *†Aukwe* or *‡Ao-//ĕin* in the south between Sandfontein and */Gam*, the *Ssu-‡gnassi* to the north-east and the *‡Küng* to the northwest.

Next in importance and numbers to the Bushmen of the /01
Kalahari are the *Hei-//om* living in the vicinity of the /31
Etosha Pan and on the outskirts of Ovamboland in the Groot- /77
fontein and Outjo districts. They are generally believed to [174]
have resulted from the interbreeding of Hottentots with a now extinct tribe of Bushmen which originally inhabited the greater portion of the present Damaraland and Ovamboland. Their manner of life is still that of Bushmen but, unlike their [197]
neighbours of the Kalahari, they have no language of their own and speak a Nama dialect. Except among the groups in the vicinity of the Etosha Pan every trace of their original organisation has disappeared almost completely. The groups living along the borders of Ovamboland have been largely influenced by Ovambo culture. In Eastern Ovamboland they are known by the Ovambo as *Ovachwagga;* in north-western Ovamboland they call themselves *Ovambo* Bushmen but are referred to by the Ukuanyama as *Wakeddi* or *Ovakeddi*. Both *Ovachwagga* and *Ovakeddi*, especially the [582]
latter, are being rapidly absorbed into the *Ovambo* through intermarriage. The *Ovachwagga* speak both the Ovambo and [191
Hottentot languages. Among the *Ovakeddi*, on the other /97]
hand, only the older members of the various groups still have a knowledge of the latter language. Of the groups along the banks of and immediately to the north of the Ovambo Omuramba very little is known. To the west they are in contact with the *Hei-//om* of the Etosha region; to the north with the Ovambo and to the east with */Kung* of the Oschimpoloveld or northern Omaheke. The *Hei-//om* of the remaining portions of Grootfontein and Outjo and of the districts of Otjiwarongo and Gobabis are scattered about on farms and are living in close association with Hottentots and Klip Kaffirs with whom they show various degrees of intermixture. In Gobabis there is only a small remnant, known locally also as the *Nama* or *Kakuja* Bushmen on account of the extent to which they have interbred with these races and the neighbouring tribes of the Kalahari.

Of the tribes which were left in Namaqualand during the /01
latter half of the last century only a few individuals have /31
survived. The */Geinin* of the Namib between Luderitz and Conception Bay, the *//Obanen* of the Huns Mountains, and the */Koma-san* of the Swartrand and Tiras plateau have disappeared completely. The */Huinin* are represented by a few groups at the southern extremity of the */Huib* plateau and adjacent part of the Namib. The */Ganin* of the Nauwkloof Mountains have likewise become almost totally extinct.

9: Thomas T-5 (1951-1955)1959
FX10 Bushmen FX10
Kung

greatly esteemed and is gathered from the crust of the pan in 317
moist balls. Bushmen sprinkle the surface with water in order to roll up just the first layer where the salt lies. When the salt balls dry, Bushmen crumble them into their food, preferring [263] salt to all sweet things and honey. Once when we asked some of the Gautscha people what they called themselves they replied with this phrase: "We are a salty people, who come [101] from a salty place."

In the dry season, two hundred people came to Gautscha 731
and lived in the bushes at the edge of the pan. This was an 361
enormous number for any area to support, but all had indisputable rights to be there, for either their fathers had drunk at Gautscha or they had relatives whose fathers had; by the rather complicated system, any Bushman may drink water and gather veld food wherever his parents had a right to do so, or may live with either his parents, his brothers or sisters, or his wife at any place where the relative of his choice has rights. There was water but not much food at Gautscha, and 731
all the people got thin and very hungry and sat around their fires at night with sweat pouring from their bodies but with nothing to eat; to make matters worse, one man coming for a visit proved to be ill and gave his disease to everyone. It was a disease that caused vomiting, high fevers, chest pains, [164] and nosebleeds of great intensity—a woman whom I tried to cure bled all one morning with blood squirting from her nostrils, pouring down over her arms and hands and dripping from her elbows, making a dark pool on the ground. The disease struck all the people, from the youngest infants to the oldest grandparents, and all the people lay for days scattered all over the ground, too ill to move. We did everything we could, of course; we provided food and medicine, firewood and water, and took turns staying up all night to nurse the people. As it happened, everyone got better within fourteen

Hunting is mankind's oldest—and least rewarding—way of life. Among its last practitioners are the Kalahari Bushmen

Part I

101
131

A PEOPLE, small of stature, few in numbers, calling themselves "!Kung," but who are called "Bushmen" by others, live today in a tremendous depression, half-a-continent wide and sunken in the southern African plateau—by name, the Kalahari Desert Basin. They live on the huge floor of this Basin, near one of its imperceptible sides. It is an open land—large to the point of vagueness, under a limitless sky. There is a word used frequently by the other inhabitants of this Basin—mostly black-skinned peoples—to define the different cultural groups now living there. The word is "nation." One speaks of the Herero nation, the Chuana nations, the Okavango nations. To follow this usage, one would speak of the !Kung nation of *Nyae Nyae*—one among several Bushmen nations. [The prefix, (!), indicates one of the so-

101

415
412

WORLDLY GOODS of a !Kung family are arrayed, *above*, preparatory to moving camp. The number of belongings cannot exceed family's carrying capacity.

[p. 4]

101 called "clicks" that mark the speech of the Bushmen. Distinction is made between four classes of "click": the dental (/), lateral (//), palatal (≠), and alveolar (!)—ED.]

But "nation" is a new word, recently arisen in the vocabulary of a country whose people are struggling to define themselves in present times. The !Kung, who know who they are, do not yet need it. For, besides !Kung, which they use rarely, they call themselves *Dzu/oassi*. *Dzu/oassi* can be interpreted as "the people" in opposition to "the animals," for example, or as "the perfect people," or, indeed, as "the only people."

Unlike other nations, the Bushmen practice no agriculture, domesticate no animals. They are hunting and gathering peoples. But all the nations
133 —Bushmen, Bantu and white alike—who live in the Kalahari Basin must

/KUNG BUSHMAN RELIGIOUS BELIEFS[1]

LORNA MARSHALL

MY purpose in this paper is to describe some of the religious beliefs held currently by the /Kung Bushmen of the interior bands of the Nyae Nyae region of South West Africa. I shall limit the paper to a description of their concepts of the gods, the problem of evil, supplication, the spirits of the dead, and the ceremonial curing dance, but leave for another paper a more detailed account of medicine men, how they become medicine men, and more about their practices and beliefs. We gathered the information which I present principally on our expeditions of 1952–3 and 1955.

Schapera traces considerable borrowing in the past by the Bushmen from Hottentots and Bergdama.[2] I did not have opportunity to trace, to any significant extent, possible present-day borrowing or exchange of ideas, and can only report that contact, and therefore opportunity for exchange, takes place between the interior bands of /Kung in the Nyae Nyae region and the Tswana and Herero on the border of the Bechuanaland Protectorate. The /Kung have contact also, but much less frequently, with Makaukau (Auen) Bushmen to the south and through them to some extent with Naron in the Ghanzi region of the Bechuanaland Protectorate. The /Kung of Nyae Nyae occasionally see /Kung to the north of their region, who in turn see the Okavango and Ovambo tribes. Although the Nyae Nyae /Kung had not enough contact with white people before we came to absorb any Christian ideas directly from them, and no Christian missionary has been in the interior of the region, an influence of Christianity cannot be precluded because the Tswana do have contact with Christianity. Our own highly valued interpreter, Kernel Ledimo, who grew up near the border and spoke Bushman from his childhood, had been educated in an Anglican mission school. Although there has been contact with people who have Christian ideas, I do not recognize with certainty any Christian elements among /Kung beliefs.

One is left to wonder if the change in the concept of the nature of the gods, particularly in that of the great god, which appears when one compares the old tales with current concepts, was brought about entirely by the philosophical and logical powers of the /Kung themselves and by their adjustment to emotional needs, or whether influences from without played some part. I hope that the research of others may throw light on this point.

I should like to mention a few of the well-known Bushman beliefs, recorded in the past, which the present Nyae Nyae /Kung do *not* have and then proceed to a more systematic description of beliefs which they hold at present.

The Nyae Nyae /Kung have various beliefs and lore about the sun and moon, Canopus, the Pleiades, and other stars, and they have the well-known myth of the moon and the hare; but they do not attribute active divinity to the heavenly bodies, which are 'just stars', they say in effect, and we did not find that they either fear

[1] We are grateful for a grant towards the publication of this long article.

14: Willet Y-4 (no date) 1965 FX10 Bushmen FX10

PREFACE

The Bushmen of Southern Africa are today represented by scattered groups of hunters on the plains of the Kalahari and on the farms of South West Africa and Angola. They are a unique and mysterious people and have attracted the attention of numerous writers since the early settlers at the Cape first made contact with the Sonquas. In this Bibliography an attempt has been made to list most aspects of the culture of the Bushmen. A bibliography on rock art was compiled in 1947, thus only a few items appear on this subject. Those included are of interest because they suggest some facet of culture or culture history. Some items are predominently of a physical anthropological nature but contain sufficient ethnological information to justify their inclusion.

The items are arranged in alphabetical order under broad subject headings and an Author-Title index has been provided. The section entitled History, was included because it was felt that the earliest references to Bushmen at the Cape and later in the interior, are of interest, in creating a picture of the life and customs of the extinct groups of Bushmen. The history of the tragic clashes between the Bushmen and other races which led to their extinction in most of Southern Africa, is traced in such historical works as J. Sutherland, Memoir respecting the Kaffirs Hottentots and Boshemans of South Africa and Donald Moodie, The Record

The main body of the bibliography is devoted to the ethnology of the Bushmen and here are included items by authors, some of whom are not ethnologists but whose work is of sufficient value to allow its inclusion in this section. The items included in the small section entitled Bushman Folklore, include popularised versions of the work of Dorothea Bleek and Lucy C. Lloyd. The section on Linguistics is purely restricted to works available in Johannesburg and no attempt has been made to obtain works by the Portuguese students of the Bushmen or other foreign linguistic studies. This can therefore claim to be no more than a token coverage of a field, in which a vast amount of work has been and still is, being done. The section entitled General, contains work not sufficiently scientific to be included under Ethnology, yet of interest, often because of their excellent illustrations. This section begins with works published after 1900 and works of a similar nature published before this date, appear in History.

Sources. Mendelssohn, South African Bibliography provided some of the older items. Many of the older periodical references were traced through the bibliography in - I. Schapera, Khoisan Peoples of South Africa and the Johannesburg Public Library's Index to South African Periodicals was also used. A list of periodical abbreviations indicates the sources consulted. Periodical titles were written out in full when they appeared only once.

Brief annotations are given in some cases. Page references and an indication of contents, have been provided for some of the older items which do not contain an index.

My sincere thanks are due to Prof. L.F. Maingard, Prof. M.G. Marwick, and Mr. G. B. Silberbauer for their valuable advice, to Prof. Manuel Guerreiro for kindly sending material on the Portuguese contribution to Bushman Studies, of which I could include only a very small number, and to Prof. P.V. Tobias for so kinily allowing me access to his bibliography on cards in the Anatomy Department.

THE !KUNG BUSHMEN OF THE KALAHARI DESERT

about the chapter

For the anthropologist, the Bushmen are one of the world's most intriguing peoples, as they are virtually unique physically, linguistically, and culturally. The physical anthropologist cannot place the Bushmen in any one of the recognized major racial groupings: Caucasoid, Mongoloid, or Negroid. Similarly, linguists have placed their language in a category, Khoisan, apart from other African language families. The velar "clicks" that characterize Khoisan languages are apparently found nowhere in the world outside of Africa.

The culture of the Bushmen shows the imprint of their harsh and barren desert habitat, and, as Marshall points out, the ethos of their culture is dominated by the quest for survival. Many Bushman cultural institutions are molded by certain ecological constants: water, the location of water holes, water-storing plants, and other edible wild plants, the movements of game. The size of the band, the daily cycle of labor, the low incidence of polygyny, are all aspects of culture marked in this way. Certain other Bushman institutions, however, are not simply cultural creations passively molded by habitat; rather, they give the Bushmen better than even odds to defy the limitations which their habitat imposes. Such culture patterns are their skillful hunting techniques, their institutionalized patterns of sharing, and their strong striving for cooperation and harmony. Few cultures give the observer such a rich opportunity to study the two-way interaction between habitat and culture.

15: Marshall E-5 (1951-1961) 1965
FX10 Bushmen FX10
!Kung

/2/ Marshall shows how specific customs reflect the dominant quest for water, and she portrays the feeling of Bushman culture as well as providing an ethnologist's construct. In this configurational model focusing on ethos, she indicates how derived themes or postulates, such /7/ as the stress on cooperation, relate to the most basic theme. Comparison of the !Kung Bushmen with the Mbuti Pygmies, the other foraging group represented in this book, reveals that even though these groups occupy very different habitats some features of their cultures are similar. These include not only elements of technology, for example, the use of poisoned arrows, but themes such as the stress on cooperation and the minimizing of intragroup conflicts, features that are a functional requisite for the close, face-to-face relationships in a foraging /2/ band. Thus a study of the Bushmen offers insight into what may be minimal and hence universal features of the foraging band as a culture type.

Bushman culture is also of interest to those concerned with African culture history, for archaeological remains of societies with a similar material culture have been discovered scattered over a much wider region of the eastern part of the continent than the Bushmen now occupy. Many anthropologists feel that the bearers of these early cultures were Bushmen, or Bushmanlike in racial type. An understanding of Bushman culture gives us insight into the cultural and behavioral setting to which the mute artifacts may have belonged.

about the author

/14 Lorna Marshall lives in Cambridge, Massachusetts, and, with mem- [10] bers of her family, has conducted several expeditions to the Bushmen of the Nyae Nyae region of South West Africa (1951, 1952–1953, 1955, 1959, 1961), of Bechuanaland Protectorate (1955, 1961), and of southeast Angola (1959). She received her M.A. from Radcliffe College in 1928. Her writings include "The Kin Terminology System of the !Kung Bushmen" (1957), "N!ow" (1957), "Marriage among the !Kung Bushmen" (1959), "!Kung Bushman Bands" (1960), "Sharing, Talking and Giving: Relief of Social Tensions among !Kung Bushmen" (1961), and "!Kung Bushman Religious Beliefs" (1962).

LORNA MARSHALL · *The !Kung Bushmen of the Kalahari Desert*[1]

INTRODUCTION

LOCATION · The Bushmen live in those parts of the Kalahari Desert in southern Africa that lie in the British Bechuanaland Protectorate, in South West Africa, and in southeastern Angola. A few additional remnants of Bushman groups still exist in Northern Rhodesia and at Lake Chrissie in South Africa. In the past Bushmen had a much wider distribution.[2]

Many Bushmen live among, and some work for, the Bantu-speaking tribes in settlements where sufficient water resources have been developed to support cattle, and some Bushmen work for white farmers in the Ghanzi area of the Bechuanaland Protectorate and in South West Africa. However, many still live in small, independent, nomadic groups, widely dispersed in the vast areas of the desert.

It is very difficult to arrive at a precise population count of the Bushmen, but a recent estimate gathered from various contemporary sources (Tobias 1956) indicates that in 1955 there were 55,531 Bushmen.[3] These figures are higher than any previously propounded (cf. Schapera 1939) and come as a surprise to many.

The Bushmen are linked with the Hottentots, a southern African people who resemble them physically and with whom they have linguistic affiliations, but who are a pastoral people with a more complex social structure. Bushmen and Hottentots together are called the *Khoisan* peoples, a coined term combining the Hottentots' term for themselves (*Khoi*) and their name for the Bushmen (*San*). The Khoisan peoples have been referred to as a distinct race (Murdock 1959: 8) or, as Howells puts it, "a major racial variety of man" (1959:306). The obscurity of their origins and racial affinities are in themselves subjects in which research continues and interesting postulations engage the attention of scientists in various fields.[4]

PHYSICAL FEATURES · The physical features of the Bushmen have drawn much attention from anthropologists. Bushmen are of small stature (adult males average approximately five feet two inches) WITH YELLOWISH BROWN SKIN THAT BECOMES HEAVILY WRINKLED IN OLD AGE.

15: Marshall E-5 (1951-1961) 1965
FX10 Bushmen FX10
!Kung

182 A lack of permanent water is probably the most trying of the difficulties
312 which beset the Bushmen of the present day in the country which shelters
[161] them. However, it is this very disadvantage which has ensured their survival,
[648] for while they have been dispossessed of their country and exterminated in the less arid parts, in the "Great Thirst Land of the Kalahari" they have been
134 comparatively safe from their European and Bantu enemies. The austerity and hardships of the Kalahari are offset to some extent by its deep level mantle of sand, which prevents run-off of the rainwater and makes it readily available for plant growth. "Clay, for example, is as dry as dust to the plant when it contains 18% of water, while most sands are very nearly saturated with 18% of water" (Schantz 1911). This means not only that the sandy soil can support more luxuriant plants in greater variety, but also that storage organs are common among them, for drainage in sand is so rapid and thorough that shallow-rooted plants at least are in a stronger position if they are able to collect and store the water before it sinks into the deeper layers.

137 Although some of the storage organs are poisonous, the Bushmen still have numerous edible bulbs, tubers and roots at their disposal. Thanks again
[222] to the sand, they can harvest these quickly and easily with wooden digging-sticks which would be inadequate in a heavy or stony soil. Other storage
[224] organs which they do not eat because of bitterness or high tannin or fibre
[262] content are nevertheless important indirectly through being eaten by the various antelopes that are the Bushmen's meat supply.

224 Hunting is easier as well, for as there could be few better tracking surfaces than the Kalahari sand and, as a wounded animal can thus be followed with very little risk of loss, hard-hitting weapons and careful aim are not
[411] necessary. Instead, the Bushmen use small poisoned arrows which have the advantage of being effective on any part of the body and of bringing death as certainly to big game as to small.

● 101 LINGUISTIC AND BAND GROUPINGS • The major groupings among the Bush-
197 men cannot correctly be called tribes; they are, rather, linguistic groupings and the names by which they have been traditionally known by Europeans refer to language: for example, !Kung-speaking Bushmen, Naron-speaking
[829] Bushmen. The Bushmen themselves and their Bantu neighbors use a multitude of names by which they refer to various combinations of local group-
[184] ings. Our own tentative and incomplete comparisons lead us to say that the language groups differ from one another markedly in some customs while they are much the same in others.

The language groups have no political unity among or within them-
[621] selves. The only social unit larger than the family is the autonomous band
[622] composed of several families and headed by a headman (see "Political Organization," p. 267). Each of the major groupings has many bands within it.

101 The Bushmen whose social structure I describe in this chapter are a
131 group of !Kung-speakers who call themselves *ju /ǒassi* and who live in the
[197] Nyae Nyae region of South West Africa. It is a region of about 10,000

square miles, centered approximately at Gautscha (about 19°48′30″ S, 181
20°34′36″ E). The region lies for the most part in South West Africa, but 131
extends into the Bechuanaland Protectorate to a number of Tswana and
Herero settlements along the border. We arbitrarily call this particular stretch [123]
of country a region because it is a region in the minds of the Bushmen. In [162]
it are some 27 bands living independently in their own traditional way and [648]
9 groups employed by the Tswana and Herero—a !Kung population of
about 1000. These !Kung intermarry. They have not formally structured the [882]
region as an endogamous unit, but they remain within it by custom and
preference. They know there are other !Kung-speakers living to the north [192]
and northwest of them, but consider them strangers, as they do the Auen- [829]
speaking and Naron-speaking Bushmen to the south.

ECONOMY

It is vividly apparent that among the !Kung 181
Bushmen, ethos, or "the spirit which actuates manners and customs," is sur- 182
vival. Their time and energies are almost wholly given to this task, for life in
their environment requires that they spend their days mainly in procuring
food. The band organization is important to their survival, and, to secure the [621]
mutual support and companionship that it affords, they seek to regulate their [578]
social actions to reduce tension and potential hostility among the individuals
within the band. They also strive to avoid the possibility of conflict between [628]
bands. Similarly, in their religious concepts and practices, the emphasis is on [771]
survival in this life on earth, not a looking forward to the eternal life in the
sky after death.

WILD PLANT FOODS (*veldkos*) • The !Kung of the Nyae Nyae region 433
have no agriculture. They subsist mainly on wild plant foods, which we re- 262
fer to by the convenient Afrikaans word *veldkōs*. The game the hunters of
a band manage to kill is an important part of their diet and much desired,
but it is by no means the daily sustenance. In this region the !Kung know 222
more than a hundred different kinds of veldkos (cf. Story 1958). Several 262
species of berries exist, dry and hard for the most part. A few fruits ripen
suddenly in a short season. Leaves, resembling spinach, make a spring salad
for a short time. Morsels of gums from certain trees are cherished like sweets.
Tsama melons and wild cucumbers grow here but do not abound in this re-
gion as they do in some other parts of the Kalahari where some Bushman
groups can live on them for certain seasons without having access to any
water. Most important to the daily sustenance of the Nyae Nyae !Kung are
the edible underground roots, tubers, and storage organs of certain drought-
resistant plants. We observed the gathering of 23 different kinds of these;
doubtless there are more. In addition to the roots and tubers, there are sev-

A Bridal Scherm The groom, to the right, and the bride, to the left, are with companions. This scherm is a particularly well-built specimen of the Bushman house.

342
[283]

digging stick in a crescent curve, and tamps the branches into them. She weaves the branches together at the top and perhaps ties a few with fiber cord. This makes a frame half a hemisphere in shape, four to five feet wide on its open side, three to four feet deep, and perhaps five feet high at the peak. The woman then lays armloads of grass against the branches.

372
[594]
[213]

The fire, not the scherm, is the visible symbol of home for a !Kung family. Summer and winter, each nuclear family has its own fire. The families cover their coals with ash during the day and fan them up for cooking. Toward evening, men and women go to the veld to gather wood and bring back whole dead trees, enough to keep their fires burning brightly all night.

361
621
[162]
[101]
[372]

The werf is the group of fires of all the families in the band. A !Kung werf has no fixed pattern of orientation except to cluster closely together. With all space around them, the band with whom we lived—Band I of Gautscha, consisting of thirty-two persons with eight family fires—usually huddled into a place roughly forty to fifty feet by about twenty. The light and warmth of their fires together wall them in from infinity and darkness and protect them from predators.

361
221

The !Kung never return to a werf they have once abandoned. They come season after season all during their lives to the same water holes and veldkos areas, but always choose a fresh spot to make a new settlement.

412
324

ARTIFACTS • The artifacts of the !Kung are simple and few but well made and well cared for. These people use stone only for sharpening metal blades,

[p. 256]

553 602 835 [601] properly in these matters, and the kin term they apply guides their behavior with everyone they meet.

The other value is obvious. The !Kung of the whole Nyae Nyae region, 619 in their thirty-six separate bands or groups, are drawn together by a feeling 553 of belonging to an in-group. The familiar names and the use of the kin 601 terms make them expect from each other behavior suitable to kinsmen— 602 sharing food, gift giving, restraint from expressing jealousy or other hostilities, conforming to group opinion, all the things they do that are conducive to peaceful living together. This sense of belonging gives security and comfort to these people in whose language the word *dole*, which means "strange," [101] means also "harmful" and "bad." They call themselves *ju /ŏassi*. *Ju* means "people"; */ŏassi* connotes something like "true" or "pure" and can be paraphrased as "just ourselves."[7]

428 [613] [622] INHERITANCE PATTERN • The !Kung have no named, structured patrilineages, but they have a patrilineal emphasis. Inheritance passes from father to eldest son, as does the succession in headmanship.

[423] There is not much property to inherit. Land and the resources of food and water are owned by the band, not privately by individuals. A consider- 768 able amount of an individual's personal property is destroyed at the time of his death. This is not done to provide implements for the spirits in the [775] after-life. The !Kung believe that the spirits of the dead have their own heavenly objects and need nothing from earth. It is done because no member of the family wants to use the common objects of the dead, which too vividly remind them of their loss. Only the more rare and important possessions are kept, such as assegais and fine ornaments. These are inherited by the eldest son. Failing a son, the spouse or a daughter or sibling or, failing these, some other close relative who was present would take the things. Whoever took them would be expected to give some of them to other relatives.

582 648 MARRIAGE • As I mentioned, the Nyae Nyae !Kung rarely marry outside the region, although !Kung women not infrequently marry Tswana or Herero men in the border settlements.

584 First marriages are arranged by parents while the children are still young. Either the parents of the boy or those of the girl may first ask for the betrothal. Parents of boys have their eyes on every girl baby and may say to parents of an unborn infant, "If it is a girl, let us have her for our son."

581 No property settlements enter into the marriage choices or marriage arrangements among the !Kung. Rather, they say about the basis of their choice that they seek an upstanding family for their child to marry into, people who are not lazy and not "far-hearted" but who are dependable and generous and behave with propriety, obeying the social rules and the

II. THE PRESENT STATUS OF THE BUSHMEN

Defining Bushmen

101 Bushmen may be defined racially, linguistically or culturally. None of these criteria used alone will give a
142 satisfactory definition. If the presence of "Bush" physical
144 type is used as the criterion of Bushman status, then some members of Hottentot tribes would be incorrectly included, and members of the hybridized Bushmen peoples of Ngamiland
197 would be excluded. Similarly the presence of a click non-
121 Bantu language would include not only Hottentots again, but also the Hottentot speaking negroid Bergdama of South West
224 Africa, and the Hadza-Sandawe peoples of Tanganyika. A
222
464 strictly economic criterion, such as the presence of a hunting
648 and gathering way of life would arbitrarily exclude the many
241
233 thousands of Bushmen who are working on European Farms or practicing agriculture and pastoralism.

114 A further complication in defining Bushmen is offered by
197 the recent work of Westphal (1962a,1962b,1963). He has demonstrated that the so-called Central Group of Bushman languages of Bleek (1929) are in fact closely related to Hottentot.

101 In this paper a simple ethnic definition of Bushmen is
[114] adopted, following the lead of Joyce (1939) and Tobias (1956). Throughout Bechuanaland, the Tswana word "sarwa" is applied to

101 non-Bantu, click-speaking peoples with a tradition of hunting and gathering in their recent past. Thus we may define Bushmen as members of tribes who are acknowledged to be "sarwa" by themselves and others. The term "sarwa" thus includes peoples of varying physical type and economy, and of four distinct linguistic stocks within the click family of languages. The one characteristic common to them all is the tradition of hunting and gathering. The economic and linguistic divisions will be elaborated below.

Numbers and distribution

161 114 The Bushmen are numerically stronger than has been generally supposed. Estimates such as Schapera's 7,000-7,500 (1930), Keith's 6,000 (1948), and Coon's "few hundred" (1955) are far too low. Despite Tobias' careful estimate of 55,000 living Bushmen (1957), the older misconceptions still persist. As recently as 1963, Bohannan estimated the numbers of living Bushmen in the hundreds (Bohannan 1963:213).

161 127 The author's estimate, based on data available in 1964, shows a total figure rather smaller than that of Tobias' 55,000. It is estimated that there are about 44,100 Bushmen alive today. This figure is based on published sources and unofficial government estimates for Bechuanaland. For South West Africa, the figures are adapted from the Odendaal Commission Report (Republic of South Africa, 1964). For Angola,

197 c. -ŋ/huki; also known as ɸkhomani (Doke 1936) and //n-!ke (Bleek 1929). A very small group now confined to the Gemsbok Park.

The numerical strength of the various Tshu-khwe and Bush languages are estimated as follows:

Xũ (Kwengo)	2,000
Shua (Danisin etc.)	3,000
//gabake (Hiechware etc.)	10,000
Deti (Tletle)	2,000
Nharo (/gwi, //gana etc.)	9,000
Bush A (!Kung)	13,000
Bush B (ɸhũa)	1,600
Bush C (ŋ/huki)	50
TOTAL	40,650

The remaining 3,450 Bushmen of the estimated total of 44,100 include over 3,000 Hai//om (Heikum) in South West Africa. These people speak a dialect of Nama Hottentot and have a tradition of hunting and gathering although only a small proportion do so today. Also included in the remainder are a small group of people around Lake Chrissie in the Eastern Transvaal. They are locally known as Batwa and number less than one hundred. Westphal includes them as his Bush D language and calls them "//xegwi." (See also Lanham and Hallowes 1956; Potgieter and Ziervogel 1955).

[101]
[114]

16: Lee E-5 (1963-1965) 1966 FX10 Bushmen FX10
!Kung

The !Kung Bushmen

101 131 162 The !Kung are the most numerous of the surviving Bushman tribes. Of the estimated total of 13,000, about 3,000 live in Angola, 2,000 in Bechuanaland, and 8,000 in South West Africa. The !Kung occupy a remarkably large area. Their country extends from north to south for a distance of 500 miles, and from east to west for a distance of 300 miles (see Map 5).

101 197 553 19 Two criteria clearly distinguish the !Kung from all other Bushman peoples: their language and their unique system of personal naming. The !Kung language has phonological features in common with adjacent Tshu-khwe and Hottentot languages, such as the four click system and the strong glottal releases. However, the vocabulary and grammar of !Kung sets it apart from the other click languages. A lexicostatistic comparison of !Kung and Nharo showed a low incidence of cognates (11.5%). [114] [193] The grammar of !Kung has yet to be adequately described, but none of the preliminary work by Doke (1925), Bleek (1929), Maingard (1957), and Westphal (1962, 1963:244) has been able to demonstrate a genetic relationship of !Kung grammar to the grammars of the other click languages.

There are no semi-!Kung languages (although the vocabulary of the southern dialect has been influenced by contact with Nharo) and therefore a native speaker of !Kung is immediately identified as a member of the !Kung tribe. This holds

551 553 the south to the Okavango River on the north. The !Kung name-relationship was first described by Lorna Marshall (1957:3ff) for the Bushmen at /Gauša Pan, South West Africa. It was found in 1964 that !Kung farm workers as far away as Gobabis, South West Africa, two hundred miles south of /Gauša, possessed the same repertoire of personal names, the same rules of name inheritance, and the same method for fictively linking unrelated individuals through the name relationship.

From the scanty evidence available on the Angola !Kung (Bleek 1928), it appears that the name relationship is not operative there. However, in Bechuanaland and South West Africa the presence of the institution is a reliable criterion for determining whether a Bushman is !Kung.[1]

101 131 162 There are three geographical divisions of the !Kung Bushmen. The northern group, numbering about 4,000, live in Angola and the far northern districts of South West Africa. The central group, numbering about 7,000, extend from the western margin of the Okavango Swamp in Bechuanaland as far as the farms of the Grootfontein district of South West Africa. [241] The southern group (c. 2,000) are confined to the farms of the

---

[1]Unpublished evidence on the southern ǂhũa Bushmen indicates that they possess a system of fictive kinship based on personal names, but the repertoire of names appears to be entirely different from that of the !Kung Bushmen (Heinz, Westphal, personal communications).

101 Ghanzi and Gobabis Districts and their immediate northern
131
162 hinterland. All three divisions speak mutually intelligible
[241] dialects of !Kung but only the central and southern divisions
[197] have the institution of the name relationship.
[551]
[184] The northern division peoples call themselves "!kũ"
101 meaning "people" (Bleek, 1928:106) and many ethnographers have adopted this as the general appelation for the tribe. There has been a bewildering variety of spellings of this name[1] and it is urgent that one standard form be chosen. It is recommended that !Kung be adopted as the standard appelation for the tribe, following the lead of Fourie (1928:83) and Marshall (1957, 1959, 1960, 1962, etc.). This is not the most phonetically accurate of the alternatives, but the controversy over spelling is an academic one because the majority of the "!Kung" do not recognize this as their tribal appelation at all!

The central division "!Kung" call themselves "zũ/wãsi" (zũ = "people"; /wã = "proper" or "true"; si = plural suffix). This translates as "the proper people" or "the true people". It also has the connotation of "just folks" which Elizabeth Marshall Thomas has appropriately rendered as "The Harmless People" (1959). Bushmen of the study area objected to the

---

[1] At least fourteen different spellings are in the literature including: Kung, !Kũ, !Kun, Chung, //Khun, ≠Kũng, ʗhũ, !xũ, !Khũ, :un, !Kung.

101 appelation "!Kung". They said it was a term of opprobrium used of them by the Bantu.

The southern division !Kung were the first of the tribe to appear in the ethnographic literature. They are described by Baines (1864) and Chapman (1868) as "Ma'kow'kow". Later workers have called them ≠Auin (Kaufmann 1910), //kau//en (Bleek 1928), ≠Ao-//ɛ̃in (Fourie 1928), Makaukau, and Auen (Schapera 1930). All these forms appear to be corruptions of the name ≠d"au//ae, which is currently in use among the Bushmen of the Ghanzi District. This is the Nharo name for the !Kung Bushmen; it means literally "north side" and reflects the fact that the !Kung have traditionally been the northern neighbors of the Nharo. The !Kung commonly apply this label to themselves, saying "we are the ≠d"au//ae (north side) people".

[197] Since all three groups, calling themselves !Kũ, zũ/wãsi,
[184] and ≠d"au//ae, respectively, speak dialects of the same language, and since the latter two groups maintain a sense of ethnic identity through the name relation it is recommended that the name !Kung be adopted as the tribal appelation. It is the easiest of the three names to pronounce and it has had the widest currency in the literature.

[184] Of the three geographical divisions of !Kung, full time
[224] independent hunters and gatherers are found only among the
[222] central group.

Chapter I

THE COUNTRY OF THE KHOISAN

H
B
101

By the year 1652, when the establishment of the pioneer Dutch settlement at Table Bay laid the foundations for the present political dominance of the white man in the country, Africa south of the Zambesi River was already inhabited by a considerable number of different native peoples. On the basis of racial, linguistic and cultural distinctions, these native inhabitants are customarily classified into four separate groups, known respectively as the Bushmen, the Hottentots, the Bergdama, and the Bantu.

B
101
105

The Bushmen, at one time spread over almost the whole of South Africa, are to-day confined principally to the Central and Northern Kalahari Desert and adjacent districts. They are a short, brownish-yellow people, with certain peculiar and distinctive racial characteristics; they all speak languages of a uniform and easily recognizable type, phonetically remarkable especially for the great prevalence of "click" consonants; and they live in small nomadic bands which lead a purely hunting and collecting existence, practising neither agriculture nor pastoralism.

H
101
105

The Hottentots formerly occupied most of the western half of the region, but are now found chiefly in the southern parts of South-West Africa. They are closely allied to the Bushmen in race, and their languages are of a somewhat similar type, although in both respects certain differences are also observable. They are, however, a predominantly pastoral people, keeping cattle and sheep, and live in larger communities with a more complex system of social organization.

The Bergdama, also inhabiting South-West Africa, are racially a true negro people, different in appearance from both the Bushmen and the Hottentots. They all, however, speak the language of the Nama division of Hottentots, to whom they have long been in subjection. Like the Bushmen they live in very small nomadic groups and derive their subsistence primarily from hunting and collecting, although some of them also keep goats.

The Bantu, finally, although historically the most recent native people settling in South Africa, are now spread over the whole country

2: Schapera E-4, 5 (no date) 1930
FX13 Hottentot FX13
Bushmen FX10

superior to those of the other native peoples that they have been able to preserve much of their original cohesion and culture, and in many cases to offer a strong resistance to the disintegrating effects of contact with European civilization.

The present work deals with those two groups of natives who have suffered most at the hands of the European settlers: the Bushmen and the Hottentots. In spite of the far-reaching differences between them, they have in common several features, not only of race and language, but also of culture, especially religion, which justify their being treated together. These common features by no means render invalid the distinctions upon which is based the customary classification of these peoples into two separate groups. They are significant enough, however, to permit of both groups being regarded as constituting to some extent a larger ethnic unit, which, it is important to note, is clearly differentiated from the Bergdama on the one hand and the Bantu on the other. The term *Khoisan*, recently coined by Schultze to denote the racial stock to which the Bushmen and the Hottentots belong,[1] has therefore been accepted here as a convenient generic name for these two peoples. The necessity for such a generic name will perhaps be seen more clearly when the racial history of each people has been considered.

Topography: General Features

The Khoisan peoples at the present time live almost entirely in the western and central portions of South Africa. The main political areas within whose borders they are found are the Territory of South-West Africa, formerly a German colony, but now administered under mandate by the Union of South Africa; Bechuanaland Protectorate, administered directly by Great Britain through the High Commissioner for South Africa; and the central and western districts of the Union, principally in the Cape of Good Hope. The Bushmen formerly extended further east into Southern Rhodesia and over the rest of the Union, but have virtually disappeared from those parts.

The territory over which the two peoples are now scattered presents a solid land mass, covering an area of approximately 915,000 square

[1] L. Schultze, *Zur Kenntnis des Körpers der Hottentotten und Buschmänner*, 1928, p. 211. The term is compounded of the names *Khoi-Khoin*, by which the Hottentots call themselves, and *San*, applied by the Hottentots to the Bushmen. The latter have no collective name of their own.

2: Schapera E-4, 5 (no date) 1930
FX13 Hottentot
Bushmen FX 10

extent by racial intermixture with other native peoples. In the Eastern and Central Kalahari, moreover, as well as in Angola, most of them are also in a state of servitude to the Bantu peoples among whom they live. Large bands of relatively independent Bushmen are now found only in the North-Western Kalahari and the adjoining districts of South-West Africa, especially in the Omaheke, Kaukauveld, and Ghansiveld. 162

Tribal Divisions

The Bushmen are divided into many different groups, each with its own distinctive language or dialect, and with a name. These groups will be spoken of here as tribes. The Bushmen do not appear to have any general or collective names for themselves. Such names have, however, been applied to them by most of the other inhabitants of South Africa. The Hottentots term them all *San*. The meaning of this word is uncertain, but Hahn interprets it as "aborigines, or settlers proper".[1] The names *Sunqua*, *Saunqua*, *Sonqua*, etc., by which the Bushmen are often referred to in the early records of the Cape, are merely verbal variations of its masc. plur. form *Sa(n)qua*. The Bantu peoples know the Bushmen by a variety of names, the most common of which are all cognate forms of the same root—*BaTwa* or *AbaTwa* (Zulu-Xosa), *BaRwa* (Suto), *MaSarwa* (Chwana), *OvaTwa* (Herero), etc. The meaning of this root has not been satisfactorily determined. A common interpretation is "people of the south", but this is not universally accepted; a more plausible alternative, perhaps, is "people of the wilderness". The name *Bushmen* itself goes back to the earliest Dutch settlers at the Cape, and is found as far back as 1685 in the Cape Records, where it occurs in several variations of its Dutch form—*Bosjesmans*, *Bosmanekens*, *Bosiesmans*, etc. It has now become generally adopted in ethnological literature and there seems no good reason why it should not be retained. 101 [619]

The languages of all the Bushmen tribes are of the same general structure, and can be regarded as belonging to one language family. They vary, however, in certain details of phonetics and especially of grammar and vocabulary, which permit of their classification into three main groups. To these the names Southern, Northern, and Central Groups respectively have been applied by Miss D. F. Bleek, 197 619

[1] T. Hahn, *Tsuni-//Goam*, 1881, p. 3.

Bushmen FX10

Chapter IV

SOCIAL ORGANIZATION

Tribe and Hunting Band

All the Bushmen in their native condition lead a nomadic hunting 222
and collecting life, roaming about in search of the game and wild 224
vegetable foods upon which they depend for their existence. The [182]
conditions of their subsistence necessarily prevent them from banding
together permanently in any considerable numbers. Wherever they 621
still retain to any marked degree their original mode of life and
organization they are found scattered over the land in small separate
communities.[1] Each such community will be spoken of here as a
hunting band. The members of a band share a common life, they see
one another constantly, they co-operate in many ways, and they are
all as a rule friendly and on fairly intimate terms. Each band also [619]
has occasional relations with other neighbouring bands, through
intermarriage and trade, and visitors may pass from one to another.
On the other hand, there are often quarrels between neighbouring [628]
bands, which may result in a prolonged state of feud and even lead
directly to warfare.

The various bands among the Heikum are generally referred to 621
among each other by a name which indicates either the locality in 101
which they live, or describes some physical or other characteristic
of the band itself or of its locality. The *se-khoin*, for example, are the
people of the *seb* or plain; the */gom-khoin* the people who eat the

[1] The social organization of the Bushmen is one of the least-known aspects of their culture, and sadly needs careful and detailed investigation. The most reliable sources of information refer almost exclusively to the North-Western tribes: Passarge, *Die Buschmänner der Kalahari*, 1907; Kaufmann, "Die Auin," *Mitt. deuts. Schutzgeb.*, xxiii (1910); (Miss) D. F. Bleek, "Buschmänner von Angola," *Archiv Anthrop., N.F.* 21 (1927); *idem, The Naron*, 1928; *idem*, "Bushmen of Central Angola," *Bantu Studies*, iii (1928); L. Fourie, "Customs of the Hei-//om Bushmen," *J. SW. Afr. Sci. Soc.*, i (1925–6); *idem*, "The Bushmen of South-West Africa," in *The Native Tribes of South-West Africa*, 1928. The relevant literature on the other tribes is for the most part fragmentary, although some valuable data on the Namib Bushmen are given by Seydel, "Aus der Namib," *D. KolBl.*, xxxi (1910), and by Trenk, "Die Buschleute der Namib," *Mitt. deuts. Schutzgeb.*, xxiii (1910). Where no special reference is made to any particular tribe the analysis given above must therefore be regarded as applying especially to the North-Western tribes, who are also the only Bushmen still leading a fairly independent life. [114]

621 101 *!gom* or omungete nut; and the *xom-khoin* the people who *xom* or scrape together, the name indicating their method of collecting salt on the Etosha Pan, along whose southern border they live.[1] How the bands are named in the other tribes is not clearly stated. In the [114] literature they are spoken of as a rule in terms of the locality they inhabit, but no indication is given whether this is also the name by which they call themselves and are known to their neighbours.

619 101 These hunting bands are grouped into what are here called "tribes". A tribe consists of a number of neighbouring bands, the members of which all speak what they themselves regard as one language. Each tribe has its own distinctive name. In the Southern and Central linguistic groups this usually ends in the word *!ke* or *kwe* respectively, i.e. "people"; but in most cases the meaning of the name itself has not been recorded or can no longer be determined. The few tribal names which can be interpreted seem to refer to some general characteristic of the people themselves or of the country which they inhabit. The *//ŋ !ke*, for example, are the "home people"; the *!tanneckwe* the "river people"; the *Hiechwara* the "people of the open country", and the *!o !kũ* the "forest people", while the *!kũ* (*Kung*) are simply "people", or, as they would interpret the name "Bushmen". The *Hei-//om*, again, derive their name from the [177] Hottentot words *heis*, tree or bush, and *//om*, to sleep, and are therefore the "tree-sleeping people", i.e. those who sleep under trees; while the term *Naron*, by which the *//aikwe* now sometimes speak of themselves, appears to have been applied to them originally by the Auen and to mean "people who are insignificant".

619 [197] The tribe is fundamentally a linguistic group. It has no social solidarity, and is of very little, if any, importance in regulating social life. There appears to be no tribal organization among the Bushmen, nothing in the nature of a central authority whose decisions are binding on all the members of the tribe, nor is collective action ever taken in the interests of the tribe as a whole. The tribe in fact is merely a loose aggregate of independent hunting bands which have a common language and name.

621 The band, and not the tribe, is the real political body among the Bushmen. Each band is autonomous, leading its own life independently of the others. Its affairs are as a rule regulated by the [623] skilled hunters and the older, more experienced men in general. In [622] the North-Western tribes, however, each band has also a chief, whose

FX13 Hottentot

Bushmen FX10

South Nguni

The woman, partly through submissiveness to her husband, partly because equally curious to see strange people of a different garb, started out on the journey after a day or two of preparation, dressed in her best garments. She had an escort of thirty or forty Chainouquas for company and for protection against others, especially against the Kochoquas, with whom the Chainouquas were then at war. But while on the way she was attacked unawares by the Kochoquas in a big wood and killed. Her ornamentation, valuables and garments were all trodden under foot, and her escort put to flight. Leaving behind two or three men, they made for the Cape and Chaihantimo, to whom they reported the news of the tragedy. Thereupon he departed instantly to his own country with his people, in order to revenge himself in war against the Kochoquas for this outrage; but he was far too weak in numbers against them.[37])

000

SONQUAS.

The Sonquas[38]) are a people dwelling in massive mountainous country. They number several thousands, and are very small in size, both men and women. They have no cattle, but live by shooting rock-rabbits[38a]) with the bow and arrow, which they use with remarkable skill. The rock-rabbits have their retreats under the rocks, on top of which they come to bask and play about during the heat of the day; the Sonquas then hit and shoot them down in great numbers with their arrows. They also go out hunting

[101] [161] 224

---

flight and returned to the great chief of the Chainuquas, who is said with his army to have gone to Chobona to ask for justice in the face of this insult, and assistance to revenge it" (*Letters desp.*, iii, 92-3; D., Dec. 31, 1658). Chaihantima appeared again at the Fort in 1661, when van Riebeeck drily remarks: "this is the same who had told us such stories about his wife having been brought up at the court of the Chobonas, having worn many jewels, and afterwards been killed by the Cochoquas. Though he still adheres to them, we can no longer believe him" (D., Aug. 3, 1661).

[38]) Sonqua, Souqua, Sanqua, etc., is the name applied by the Hottentots to the Bushmen, and according to Hahn (*Tsuni-//Goam*, 3) is derived from the root *sa* (plur. *san*), meaning "aborigines or settlers proper". It is significant that van Riebeeck does not mention them at all in the list of tribes prepared for his successor, although they figure often enough in his journal. He says of them: "They are robbers, subject to none, and depending upon their arrows and assagays, treacherously robbing their neighbours of their cattle and their wives" (D., Oct. 31, 1657); and again: "The Soaquas, a tribe without cattle, dwelling beyond, among the mountains of Africa, and mostly robbers" (D., Nov. 8, 1660). 101

[38a]) *Hyrax capensis*, still commonly known in S. Africa as "dassies."

MARRIAGE AMONG /KUNG BUSHMEN

LORNA MARSHALL

101 BECAUSE within the area we indicate by shading on the map[1] the /Kung Bushmen intermarry among themselves, by custom and preference, members of the Harvard Peabody Smithsonian Kalahari Expeditions needed a convenient way of referring to that area as a unit and arbitrarily called it the region of Nyae Nyae.

Nyae Nyae is a corruption of the /Kung name //Nua/ei. The name Nyae Nyae refers
131 strictly to a group of pans in South West Africa (S.W.A.) centred approximately at Gautscha Pan at about 19°48′30″ S, 20°34′36″ E. We extend the application of the name to an area around the pans of about 10,000 square miles, lying for the most part

[102]

Map of portions of South West Africa, the Bechuanaland Protectorate and Angola. The shading marks the Nyae Nyae region.

in S.W.A. but reaching some miles over the border of the Bechuanaland Protectorate (B.P.). There are no strictly conceived boundaries around the area. We can only vaguely define it by saying that it does not include Karakuwise to the west or Chadum to the north. It does not, we think, reach eastward much farther than Kai Kai, or southward much beyond Blaubush Pan (40 or 50 miles south of Gam).

101 We establish the periphery of the region on the basis of statements made by
582 /Kung informants in the interior. They say that they intermarry among the bands
[131] which live within the area we describe and do not customarily marry with other

[1] The sketch-map here provided is based on the
[102] National Geographic *Map of Africa and the Arabian Peninsula*, March 1950, and the *Times Atlas of the World*, Vol. IV. The orientation of Gautscha is taken from the S.W.A. Surveyor-General's map dated at Windhoek 7:11:35.

[1]The 15th independent group had its permanent waterhole at Tsumkhwe, outside the Dobe area.

312 824 222 The net effect of this effort is that an individual must drink much more than the minimum daily requirement of 72 ounces of water. In fact, men who were living on Fockea roots, were observed to dig out between 15 and 20 of the roots per day. The quantity of water provided by these roots is estimated at 150-300 ounces, part of which went to provide water for the children of the camp.

222 484 312 A description of one Fockea trip, in which the author participated, will serve to illustrate some of the difficulties of living away from standing water.

[123] This trip began on 6 November and ended on 16 November, 1964. The group consisted of 12 Bushmen (plus the author); there were three men, four women, and five children. One of the young women gave birth during her stay so the returning group consisted of 13 Bushmen.

November 6 - This group (minus one of the men who came out the following day) set out from the Dobe waterhole at 10:00 [103] a.m. They spent the day walking to a nut forest named !wi/wama which was situated eleven miles west of Dobe. The original plan was to remain there for five days.

[481] The pace was leisurely to suit the three older children [855] (ages 12, 8, 6 respectively) who went on foot and the young [843] woman who was in the terminal month of her pregnancy. On the way we stopped at intervals to eat seven different species of

/135 cont./

144 (Ngamiland): "I should like to observe briefly that the Kalahari
197 Bushmen are low in my estimation, both in respect to their language and to their appearance; I was able to confirm an extremely close relationship with the Nama [Hottentot], but in an old dialect no longer spoken today."

Since I lack the knowledge for making anthropological
141 measurements, I shall confine myself to /136/ presenting several ≠Auin types as I observed them. They may not be without value for comparative purposes.

I should like to add that in measuring physical height I obtained the following results:

Adult men (between 20 and 40 years of age)

Average	1.51 1/2	meters
Maximum height	1.62	meters
Minimum height	1.47	meters

Adult women (between 20 and 40 years of age)

Average	1.45 1/2	meters
Maximum height	1.53	meters
Minimum height	1.38	meters

A. Geography and Statistics

The ≠Auin, as they call themselves and as they are known to
131 the neighboring Bushmen tribes, inhabit that part of the central Kalahari which is more or less immediately bounded by the watering places Rietfontein, Ganab, Gam, Sidonitzaub, Otjiamangombe, Tjumda, Epukiro, Oas, Stampriet, Rooigrauwater, and Habakobis. Their territory lies for the greater part within the boundaries of the German protectorate. The adjoining sketch indicates as accurately as possible the geographic location, as well as the approximate territory of the neighboring Bushmen tribes. The
101 Hottentot designate the ≠Auin as ≠Au-San (Schinz), the inhabitants of the Chanse Veld as ≠Aukwě (Passarge), the Betschuana [Tswana] as Makaukau. The approximate number of Auin (1),

[104]

1. For the sake of simplicity I shall from now on omit the initial mark ≠, which indicates the click.

[54 cont.]

171 of various religions have found entry here. Among the Bushmen
177 tribes I visited there is the common belief in a supreme good be-
171 ing, whose name varies. The people described here [55] call the
176 supreme being X'u, "the lord" or "the great captain" (1). It is

[782]

1. According to Vedder, the supreme being is Huwe (Tsumeb). When the first veld fruits ripen, an offering is brought before sunrise. A freshly broken twig is inserted into a piece of wood with a hole bored through it. The people are seated in a circle, and the eldest passes around a tobacco or dacha pipe made out of a tubular bone.

the same expression that the Cape Hottentot used in speaking to the German traveler Kolbe, with the same significance and pronunciation 705 (2). The name could not have come from the[1]

114
171
176

2. J. Schapera (The Khoisan Peoples of South Africa, 1930) has critically referred to my observations on this point. In this connection I must note: the "great captain" among the eastern !Kung may rightfully be designated as "supreme being." I have already given his characteristics in my earlier publications.

[104]
[194]

The spelling is correctly X'u. I use X' to designate a click that is even lower than "!". It is also found in other words, such as X'Ame = lion. Since not all publishers provide this character, I have sometimes been forced to write "Khu" or "Chu." This word, which the !Kung, too, translate as "lord" or "great captain," was already found, as Schapera indicates, among the Cape Hottentot in 1705 as Khourou = "Supreme Ruler" and "Great Chief" or "Great Captain"; Kolbe gives a quite analogous citation a little later, and Hahn reports of one old Nama, "The people say,

1 [CONTINUES ON p. 108 - ANALYST]

/259 cont./

342 are filled with grass. The door is a hole scarcely a meter high;
[354] immediately behind it the fire burns almost continuously, so that, at least for the European, crawling into the hut presents considerable difficulties. Since the Bushmen are often forced to
[361] move their settlements because of the lack of veld food or because of the water conditions, they not infrequently content themselves with incomplete huts, which are not closed to form a full circle, but represent only a part, a segment of a hut, as it were, and give only scant protection against the sun.

For the rest, it is astonishing how hardened these practically
147 naked Bushmen are against the cold of the night which during the cold season is very sharp -- not infrequently below O° [centigrade].
[513] Unclothed except for the loincloth, they calmly go to sleep on the cold ground near a small fire, exposed to the icy night air, a thought that gives chills to Europeans, who are unable to sleep without three woolen blankets on such nights.

Concerning the much discussed racial position of the Bush-
144 men, I have already remarked above -- at least concerning the Heikum and Kung -- that their descent from the Hottentots, as is frequently asserted, seems doubtful to me. The Bushmen's smaller size, of course, can be accounted for by the debilitation of the race through centuries-long unfavorable living conditions. What argues against the notion of racial affinity, however, is the anthropological fact that steatopygia is not to be found among the Heikum and Kung women, /260/ and, in addition, the lan-
197 guage is totally different.

I attempted to collect a sample of the vocabulary and some grammatical characteristics of the language of the Heikum on the Omatako and of the Kung in the Kaukau Veld, which I present below. In doing this, it became evident that the languages of the Heikum and Kung are merely dialectically differentiated, while they seem to have almost no relationship to the Nama language. The click sounds, to be sure, are almost the same as
[194] those in the Hottentot language; hence, / designates the dental click, // the lateral click, ! the cerebral [retroflex] click, and
[104] ≠ the palatal click. By ⁝ I designate the sharp opening of the glottis in speaking the initial vowel, which frequently occurs between a consonant and a vowel or between two vowels of the same word, and which does not occur in this fashion in the Nama.

There were more species of grass, and, particularly on the dunes, more of trees and shrubs. The fauna was also richer for there were buffalo and elephant and many waterfowl in addition to the animals found in the Kalahari.

The Bushman languages represented in this paper are classified according to Bleek's *Comparative Vocabularies of Bushman Languages* (1929). They are !h3:, the closely interrelated ||ganakwe, |gikwe and Naron, and Auen (see also Bleek, 1928: 60-64).

!h3: is a member of the southern group, in which the lip click is found, and a dialect of what Bleek calls |nu||en, S6 in her system of classification. Bleek's spelling is !k3:, but I heard the click aspirated. It is spoken in the neighbourhood of Lehututu, which is 150 miles south of Ghanzi.

||ganakwe is spoken to the east of Ghanzi, and has been studied by Maingard (1957).

The centre of the |gikwe language appears to be in the country to the south-east of Ghanzi. It is a member of Bleek's Central group, closely allied to Naron and easily understood by Naron speakers although many words are different. A curious feature of the phonetics is the occurrence of the ejective lateral explosive followed immediately by the velar glottal affricate (see Cole, 1955: 23 and Beach 1938: 222-223). The first sound is not mentioned in any papers that I have seen on the Bushman languages.

Naron is Bleek's C2. There is an error which is liable to confuse one on page 3 of her publication, where the languages of the Naron and Masarwa of Tati have been transposed. Naron should be under C2 and the Masarwa language under C1. A grammatical sketch of Naron is given in Bleek's paper of 1928.

Auen, Bleek's N1, is the eastern form of the !khû linguistic group and is spoken round Gautscha Pan. It was studied by Maingard when he was a member of this same expedition and an account of it is given in his paper of 1957. In this paper I refer to it as Eastern !khû.

The work done in the Kalahari was done through interpreters, and much of that in the northern area likewise, except towards the end of the expedition when through closer contact with the Bushmen for a longer time than in the south, I was able to acquire a smattering of the Eastern !khû language, enough to ask straightforward questions and to understand straightforward replies. The phonetics of the Bushman languages are a study in themselves, and I do not claim that my spellings and indications of the tones are exact. In the orthography I have followed Bleek (1929) with the following exceptions:—

1. I have placed the n first when it is combined with a click. It has been the convention to place the n after the click in the written Khoisan languages, the argument being that the n and the click are pronounced simultaneously (Meinhof, 1909: 5). To my ear the n is the first sound in the combination.
2. Bleek does not mention the voiced h, which sometimes follows a nasalised click. I have accordingly followed Doke (1936: 448) and used the symbol ɦ.

For easy reference, the symbols I have used are listed at the end of this introductory chapter.

ORTHOGRAPHY.

The following are the approximate values of the letters and symbols used in the spelling of the Bushman names. They have been taken from Bleek's paper of 1929, pages 12-14. 104 194

b, d, h, k, l, m, n, r, s, w, z	as in English.
k', t'	as above, but with glottal closure.
g	as in *get*.
j	as in *yet*.
k'	the velar glottal affricate.
x	as German *ch*.
ŋ	as in *sing*.
ʃ	as in *ship*.
ʒ	as in vision.
ɽ	the flapped retroflex consonant.
ǀ	the dental click.
ǃ	the palato-alveolar click.
ǁ	the lateral click.
ǂ	the alveolar click.
ʘ	the lip click.
a:	as in *hard*.
a	the same sound shortened.
ɑ	the same sound produced far back in the throat.
e	as in *air*.
e:	as in *say*.
ɛ	as in *met*.
i	as in *hit*.
i:	as in *me*.
ɔ:	as in *haul*.
ɔ	the same sound shortened.
o	as in *notice*.
u	as in *put*.
?	the glottal stop.
~	over a letter denotes nasal pronunciation.
'	over a letter denotes accentuation of the syllable.

The middle tone is not marked, the high tone is marked by a dash above the line preceding the syllable, the low tone by one below the line, as ¯ha, ₋ha; rising and falling tones are marked ʼha and ˏha.

The voiced h is written ɦ.

9: Thomas T-5 (1951-1955)1959
FX10 Bushmen FX10

104

Note

THE spelling of Bushman words and names is at best a rough approximation. Most Bushman words and names have clicks in them, usually clicks acting as consonant sounds. For the purpose of simplicity, the clicks have been omitted.

[p. 2]

10: Bleek E-5 (no date) 1924
FX10 Bushmen FX10

NOTE ON BUSHMAN ORTHOGRAPHY

By D. F. Bleek

IN writing the article on "Bushman Terms of Relationship" appearing in this issue of *Bantu Studies*, I have tried to follow the phonetic script of the International Phonetic Association, as far as I understand it, except for denoting clicks. For these I should be willing to use the symbols chosen by Mr. Doke for Zulu clicks, were they adequate for expressing all the click combinations found in Bushman; but they are not. 104 114 194

Had Mr. Doke seen fit to adopt one symbol for each implosive sound, regardless of the accompanying breathed sound, I could have used these symbols for three of the Bushman clicks. But unfortunately Mr. Doke has not followed that course, but has chosen three symbols for each implosive sound denoting a combination of the implosive sound with the sound made by the expulsion of the breath.

Every click has a double closure, one made by the front or tip of the tongue against the teeth, alveolar, or palate, or of the lips together, the other by the back of the tongue against the velum, as Mr. Doke has shown in his admirable experiments. In making the click alone, only the front closure is audibly released, the back closure might stay in position, for all we know, no breath being emitted from the lungs. We cannot call that click either unvoiced, voiced, or nasal. But in speaking, this implosive sound is accompanied or followed by breathed sounds. The back closure being in the position for "k" or "g", if the air is pressed against that closure while the click is made, it will produce a slight "k" or "g" sound in rushing out. These sound combinations are called by Mr. Doke and others unvoiced and voiced clicks. If the uvula is lowered while making the click, a nasal sound is produced.

For these three combinations Mr. Doke provides symbols. All three are found in Bushman, the first in very many examples; but there are words in which not the slightest "k" or "g" sound is audible with the click, the back release is silent. In others the back release is silent, but an aspirate follows before the vowel. Again, there may be a treble closure: front of tongue, back of

10: Bleek E-5 (no date) 1924
FX10 Bushmen FX10

104 tongue, and glottis. The front of the tongue is released first, 114 making a click, then the back is exploded, making a sort of glottal 194 plosive. The fricative "x" may also be combined with the click. For these clicks or combinations of sound there is no provision in Mr. Doke's system, so to avoid confusion I have followed the old custom of all writers on Bushman and Hottentot, and used a sign for the click alone, expressing the other sounds by their ordinary symbols.

104 This may best be shown by examples. We find the dental or 194 alveolar click in the following combinations :—

Bushman spelling.	English.	Mr. Doke's spelling.	Old Bantu spelling.
ǀa	to fight		
ǀka	to leave	ʗa	ca
ǀkha	stick	ʗha	c'a
ǀha	husband		
ǀxã	to shoot		
ǀk'a	river bed		
ǀga	hippopotamus	ɣa	gca
ǀna	head	ŋa	nca

The retroflex plosive click is found in the following combinations :—

Bushman spelling.	English.	Mr. Doke's spelling.	Old Bantu spelling.
ǃa	along		
ǃkã	to await	ʠa	qa
ǃkhau	bee	ʠhau	q'au
ǃham	first		
ǃxa̧	sister-in-law's husband		
ǃk'ae	to skin		
ǃgã	frog	ɢa	gqa
ǃna	winter	ɲa	nqa

These combinations can be found with the retroflex fricative click, which corresponds more or less to the lateral click of Bantu. Bushmen do not make this click with the tongue against the teeth or side of the mouth, but place it in about the same position as for the last click, only they release it gently, as in making the dental click. I give as examples :—

10: Bleek E-5 (no date) 1924
FX10 Bushmen FX10

Bushman spelling.	English.	Mr. Doke's spelling.	Old Bantu spelling.
ǁa	to go		
ǁka	wet	ʒa	xa
ǁkhā	lion	ʒha	
ǁhagen	to equal		
ǁxā	again		
ǁk'ạ ǀkwi	son's father-in-law		
ǁga	night	ʒa	gxa
ǁna	there	ŋa	nxa

\ below the line indicates a low intonation.

The same combinations can be found with the alveolar plosive click, which is made as the retroflex plosive click, only with the tongue pressure very far forward, almost on the teeth. For example :—

Bushman spelling.	English.
ǂabbakn	to burn
ǂkā	bare
ǂkhàra	wingfeather
ǂhau	to jump
ǂxamma	to fetch
ǂk'anna	to call
ǂgabbetn	to throw
ǂna	to forget

The fifth click, found only in Southern Bushman, is made by pressing the lips together and then sucking the air in. It is found in the following combinations :—

⊙pwa little, ⊙bu to rain gently, ⊙ho tree, ⊙mwainya to kiss.

In his "Notes on a problem in the mechanism of Zulu clicks", Mr. Doke speaks as if no "k" sound were heard in what he calls the "unvoiced" clicks. I think most people hear a very slight "k". Colonials, in using Zulu or Kafir names, very often omit the click and say the rest of the word as they hear it. They always get a "k" sound, *Cetywayo* becomes **Ketywayo**, *X'osa* becomes **Khosa**, and so forth. I do not know of any Bantu names with clicks that have turned into words beginning with a vowel on the lips of Colonials.

On the other hand Hottentot place names, when adopted by Colonials and stripped of their clicks, sometimes become words

10: Bleek E-5 (no date) 1924
FX10 Bushmen FX10

000 beginning with "k", such as *Kakamas*, *Karakhois*, from ǂkakamas, ǂkarakhois; and sometimes turn into words beginning with a vowel, as *Aus*, *Abiam*, *Oas*, from ǂaus, ǂabiam, ǂoas.

Moreover, by speaking of "unvoiced" clicks, Mr. Doke shows 104 that he is thinking of the expulsion of breath from the lungs, not 114 merely of the implosive phone, the click proper. In spite of my 194 disagreeing with him on this point, I would adopt his symbols, were they adequate for Bushman transcription. As it is, I stick to the old signs long identified with the Hottentot and Bushman clicks, and sufficing for all purposes, rather than inventing a whole row of new symbols.

000 To Dr. Beech I tender hearty thanks for his kind help in explaining the phonetic script of the I.P.A., which would otherwise have remained a closed book to me. I only hope that this attempt at Bushman transcription may be clear to other students.

13: Marshall E-5 (1952-1955) 1962 FX10 Bushmen FX10
Kung

776 171 The name *Hishe*, Schapera tells us, is used by the Naron and Auen.[1] He thinks it may be a corruption of *Heitsi Eibib*, a mythical hero of the Hottentots.[2] As this name is not reported for other /Kung groups by Miss Bleek, Vedder, or Lebzelter, it is possible that it has been borrowed by the Nyae Nyae /Kung from the Auen. The Auen (also called Makaukau) live immediately south of the Nyae Nyae region.[3]

The name *Hawe* is reported for Miss Lloyd's /Kung informants from Lake Ngami by Miss Bleek, for the /Kung at Tsumeb by Vedder, and for the eastern Kalahari group by Dornan, but not for the Auen or Naron, who said to Miss Bleek, as Schapera tells us,[4] that 'he [*Hawe*] was the "captain" of the men in the north, the Makoba and others. They also said he was the brother of *Hishe*, while one man called him the "captain" of the white people'.

The name *Kxo* is something of a puzzle. I spelt it this way because I thought I heard both the *k* and the velar fricative sound *x*, as distinct from the name *Ko*.[5] I believe now that what I heard as *Kxo* is the name which Schapera tells us is spelt both *Xu* and *//Khu* by Lebzelter.[6] Lebzelter's account of *Xu* given him by the group he calls the eastern /Kung accords so closely with the Nyae Nyae /Kung's account of *Hishe—Hawe—Kxo* that I feel certain that *Xu* and *Kxo* are conceptually the same being.

The Nyae Nyae /Kung did not have the name (or title) */kkuba*, the Hottentot word for 'master', which Schapera tells us the Auen and Naron were beginning to borrow from the Nama when Miss Bleek worked with the Auen at Sandfontein.[7] Nor did they have *Thora* which Dornan heard among Bushmen of the eastern Kalahari.[8] And none of the informants we worked with knew the name *Erob* recorded by Lebzelter among the /Kung in the Oschimpoloveld. Schapera tells us that this name came from the Hebrew *Elohim*, a name used by missionaries among the Nama for 'God'.[9]

776 I shall have more to say about *//Gaowa* and *≠Gaolna* presently. The remaining three names, */Gara*, *Gani ga*, and *≠Gaishi ≠gai*, do not appear in the accounts of Bushman religion which Schapera analysed. I struggled to ascertain that they were names, not terms, titles, or descriptive phrases. So far, my evidence leads me to consider them names, but I could not trace their origin. My informants had no idea

[1] Schapera, op. cit., p. 182.

[2] Ibid., pp. 191, 374.

[3] For the location and extent of the Nyae Nyae region see Lorna Marshall, '/Kung Bushman Bands', *Africa*, vol. xxx, no. 4, Oct. 1960, pp. 325–7.

[104 114] [4] Schapera, op. cit., p. 183.

[5] Some /Kung informants, /Ti/kay among them, claimed they did not know the name *Ko*. Others told us that *Ko* is a god of other people, a different god, not *≠Gaolna* or *//Gaowa*. They said, for example, that the white man's god is *Ko*. One informant said, in effect, that, even though *Ko* was a god of other people, he could kill anybody—white men, black men, and Bushmen. One is interested to note that *Ko* was the name of the female mantis god of the Bushmen of Basutoland, reported by Arbousset, as Schapera tells us (ibid., p. 181).

[6] 'Lebzelter, in his account of Kung religion, says that all the groups investigated by him have the belief in a "supreme good being" ("ein höchstes gutes Wesen"). Among the Eastern Kung this being is termed *Xu* (elsewhere he spells the name *//Khu*) or *Xuwa*, "the Lord" or "the great captain", whom he identifies with Vedder's *Hawa* or *Ha'a*.' (Ibid., p. 183.)

Bushman languages present so many difficulties to those who are not experts in them—difficulties in recognizing the clicks and in sorting out variations in pronunciation between individuals even of the same group, as well as variations that are probably imposed by the position of the words in the sentence and by other grammatical configurations, &c.—that such discrepancies as *Kxo*, *Xu*, and *//Khu* are relatively slight. Fully aware of my own inadequacy in the language, I usually assume when I differ from another observer that the other is right and I am wrong. However, I cannot simply adopt another's rendering of the word without knowing if the discrepancy is due to dialectal differences or to my ignorance or what, and so must stick to my own approximations.

[7] Schapera, op. cit., pp. 182–3.

[8] Ibid., p. 183.

[9] Ibid., p. 190.

13: Marshall E-5 (1952-1955) 1962 FX10 Bushmen FX10
Kung

where the names came from ('The old people told us that he gave himself these names', they said) and I do not have sufficient relevant comparative material to throw possible light on the question. Informants said that *≠Gaoʃna* was the oldest of the names of God and that */Gara* was the next oldest. 776

The Names of the Lesser God

The great god named the lesser god by giving him all of his own 'divine' names but not his human name, *≠Gaoʃna*. 553 776

Having been named for the great god, the lesser god is the great god's namesake, his *!gnma* (*!gn* is name, *ma* is small or younger), and the great god is the *!gnʃna* (*!na* means old, older, or big).

The concept of the namesake, and of the relationship between the *!gnʃna* and the *!gnma*, is an important one in the /Kung kinship system.[1] */Gnʃna* and *!gnma* are always of the same sex, /Kung names being sex-linked. One shares in some mystical way the entity of the person for whom one is named. Incest taboos require that one must not marry the parent or offspring of one's *!gnʃna* or *!gnma*. Behaviour between a *!gnʃna* and a *!gnma* is as open and free from formal restrictions as any in /Kung society. They have the joking relationship. Only the usual respect of the young for the old is expected.

The opposite conditions exist between parent and child. A man must not name a son for himself or a daughter for her mother. Parent and offspring do not have the joking relationship.

It was interesting to me to find the great and lesser god in the *!gnʃna–!gnma* relationship rather than the father–son relationship, as it offers some evidence that the concept of the two gods is not influenced by the Christian concept of God, the father, and Jesus, the son. Also one comes to see that the father-son relationship would not serve the Bushmen as well as the *!gnʃna–!gnma* relationship in explaining the problem of evil, for a son would not present as sharp a duality, but, according to human standards, would express respect, obedience, deference, propriety, and assistance, which is not *in total* the function of the lesser god. 776 [177 773]

The Names of the Wives of the Gods

The Nyae Nyae /Kung believe that *≠Gaoʃna* gave all his own 'divine' names to both of the wives; *di*, the suffix which means 'female' is added: *Hishedi*, *Hnwedi*, *Kxodi*, */Garadi*, *Gani gadi*, *≠Gaishi ≠gaidi*, *||Gaiwadi*.

≠Gaoʃna, the great god's human name, is not applied to the wives, men's names never being given to women. One would say instead *≠Gaoʃna a tsan*, '*≠Gaoʃna* his wife'. [553]

Each wife has a human name as well. The elder one, who usually lives alone with *≠Gaoʃna*, is named *Khwovaʃna*, Old Khwova. The younger one is *||Gow*. (*||Gow* rhymes with *how*. The *ao* sound in the men's names Gao, ≠Gao, and /Gao I use arbitrarily and mean by it a slightly shorter, more closed sound, like the *ou* in *ouch*.) We knew only two women named ||Gow but knew many Khwovas. [104] [553]

The wives of the gods may be referred to or addressed by a respect term, used [576]

FX13 Hottentot
Bushmen FX10

782
821
[539]

O gallopers,
O gallopers,
Do ye not know me?
Ye do not seem to know my hut.

Then they speak to the Rain itself:—

Thou shouldst put thy tail between thy legs,
For the women are looking shocked at thee;
Thou shouldst put thy tail between thy legs for the children.

The Rain seems here to be thought of as a magic animal ridden by spirits."

791 Certain magicians have power over the Rain, and can cause it
821 to come or stay away, as they please. These powers remain with them even after death, and just as in life they are asked for rain, so when they are dead, they may also be entreated to send it. Other magicians have a similar power over the wind, */khwe*, and are protected by it. The howling of the wind is believed to forebode evil; it tells the beasts of prey where to find people, and when it blows strongly they can approach the huts unheard. In the mythology the wind
[773] is represented as having formerly been a man, which now wears the form of a bird.[1]

773 Among the Bushmen of Basutoland and the Orange Free State we
776 meet again with tales about the Mantis, differing but slightly from
[184] those of the Cape. He seems, however, to have been here the object
[794] of a definite cult as well. According to Arbousset, it was believed that *'Kaang* (i.e. */kaggen*) or, as he was also termed, *'Kue-'akeng-*
[761] *'teng*, "the man (master) of all things," causes life and death and gives
[821] or refuses rain. All the animals have special marks which he has put
[825] upon them; deficiency of game is attributed to him, and he is invoked for success in the chase. He is also worshipped in times of famine
796 and before going to war, when the *mo'koma* or "dance of blood"
535 is performed all through the night. This dance Orpen's informant,
[773] Qing, described as follows: "*Cagn* (i.e. */kaggen*)[2] gave us the song of this dance, and told us to dance it, and people would die from it, and he would give charms to raise them again. It is a circular dance of men and women, following each other, and it is danced all night.
[786] Some fall down, some become as if mad and sick, blood runs from the noses of others whose charms are weak, and they eat charm medicine, in which is burnt snake powder.

[1] Bleek, *Bushman Texts*, 17; Lloyd, *Bushman Material Collected*, 9, 20–1; Bleek and Lloyd, *Bushman Folklore*, 195–9, 393–7 *et passim*; D. F. Bleek, *Bushman Folklore*, 307–9.

[104] [2] In some orthographies, especially that used for the Zulu-Xosa languages, the symbol c represents the dental click, written / in the standard orthography for Bushman and Hottentot languages. *Cagn* is therefore merely another way of writing */kaggen*; both represent the same sounds.

[5 cont.]

172 the Oldoway race as one of its carriers, the presence of a Eurafrican racial element from oldest times on may be regarded as certain also for South Africa. The carriers of this hand-ax industry, who, I am convinced, already carried on a kind of plant cultivation and were tied essentially to the forested zones, were later followed by a group of peoples and races with definite flake industries. Among these we may include the Katanga race and the other Australiform finds. A new wave of Eurafrican racial elements was brought by the carriers of the blade industries of the
174 Middle Stone Age of South Africa. Even today we are still unable to determine when the Bushman races adopted a Stone Age industry or even when they entered the country. Just as racially
[144] the Bushman incorporated remnants of all the preceding races or
[154] those that at one time existed side by side with them (Europoid -- Australiform), so their culture, varying from tribe to tribe, likewise constitutes a unity only in its optimal adaptation to the conditions of the environment. In its individual traits, on the other hand, it represents a residual culture whose stability depends on a selection intentionally and purposively carried out, and which resulted from foreign cultures from the Old Stone Age up to the present.

Chapter 1

The Bushmen of Angola

105 We are indebted to D. F. Bleek (1) for most of the data

[113] 1. D. F. Bleek, "Bushmen of Central Angola," Bantu Studies, Vol. III, No. 2, 1928 Johannesburg. Further, Archiv für Anthropologie, 1930.

concerning the Angola Bushmen. The Bushmen are !Kung. The men are 159.3 (145.5-170) centimeters tall, the women 148.8 (135-161.3) centimeters. They live between the Msuma in the north, the Lomba in the south, and between Okawango and the

[5 cont.]

105 Ninde. They have stopped collecting veldkost and confine themselves to hunting, exchanging the products for vegetables and the like from the Mabunda [Bunda] and Luchazi, with whom they have a dependent relationship. Their time divisions are the same as those among the !Kung in the south.

The Angola Bushmen have two or three wives. Some of the married couples were cousins.

Each household has a number of calabashes, a few baskets, and a clay pot. Wooden pestles are used for pounding the grain, as in the south.

Among the Bushmen of Kunzumbia, the ear lobes and nasal septum are pierced. All adult men have tattooing on the forehead with vertical lines between the eyes. Furthermore, on the arm and chest they wear so-called "flesh marks" (2) [6] to

[117] 2. These are also found in Ongandjera and along the Natakanako Pan.

record the big game they have killed. The women, too, are tattooed. As weapons, besides bows and arrows, they have the kirri and a short knife. Spears are rare. Ironware, of course, is obtained in trade from the Bantu for the most part, although the Bushmen in Musombu already have their own forge.

[114] The rain dance is described by Bleek just as I have witnessed it. The women and girls stand in a group on one side, singing and clapping their hands, while the men also sing, but do not clap, and perform rhythmic movements with the upper part of the body and arms. They sing:

//nwa-se //kabama //gu a i-i New moon, come out, give us water
//nwa-se tatana //gu a i-i New moon, thunder water down for us
//nwa-se tala u//gu a i-i New moon, throw water down for us.

For the boys' initiation, the candidates withdraw into the forest with three medicine men for a month. There they dance at night, and occasionally the spirit Huwe appears at the dance. There is also a girl's initiation, and at that time another spirit, //Gaua, is supposed to lead the dance. The tattooing of the girls is done in his honor.

ANGOLA !KUNG WESTERN OTJIMPOLO VELD

[6 cont.]

105 In their religious ideas, the moon plays the chief role. The new moon is supposed to be a child or a man; the full moon, a woman. They also say that the moon is the older sister, and the sun, the younger sister. Besides the moon, Huwe and //Gaua appear as mythical personages. Instead of Huwe, they also say //Nwa-se, "little new moon." Bleek believes that Huwe is the spirit of the forest, who causes the growth of trees and grass and thus also the growth of game, therefore determining the success or failure of the hunt. Whether or not Huwe is worshiped could not be determined. It is interesting to note what is said concerning //Gaua: "//Gaua is another being. The people from Ngami Lake give the word three meanings: dream, ghost, spirit. Among the Angola Bushmen it is used sometimes for ghost, and sometimes more impersonally. A woman said: When a person dies, a ghost (//Gaua) comes from his grave, which can be seen by the medicine men." Thunder and lightning come from //Gaua. The person struck by lightning becomes a star in the sky. The stars are the campfires of //Gaua. The Bushmen are supposed to be the children of //Gaua. He is a man who lives in the forest, and his home is a hole in the ground. An informant explained that //Gaua is equivalent to Ndjambi (god). There are two kinds of medicine men: those who can see the spirits, conduct the boys' initiations, and do the tattooing, while the second kind cures the sick.

Chapter 2

The Bushmen of the Western Otjimpolo Veld

122 In Shandi, among the eastern Ukuanjama [Kuanyama], I was able to establish contact with the Bushmen through the kindness of the Resident, Mr. Eaddes, and of the native pastor, Paulus.
101 In part, these Bushmen were genuine !Kung, who said they were the same as those from Karakowisa, with whom, however, a fruitful understanding was impossible; and in part they were people who called themselves !Kung, but, judging by their language and customs, are southern Bushmen of Amboland. They themselves say that their fathers came from Ongandjera. The following

[753] 157 [23 cont.] THE SICK BUSHMEN LIE SILENT AND patient, but a case of illness in a village upsets all its members, partly out of compassion, and partly out of fear of the spirits of sickness. The modes of conduct that I have described already permit certain conclusions concerning the structure of the psychological personality among the Bushmen. It is certainly impossible to compare the mental set of an intellectualized, highly domesticated European with that of these primitive hunters. There is absolutely no difference, however, between the simple European and the natives in their conception of life and their manner of reacting to environmental influences. As I have already explained in another place, we may speak of a law of inertia in cultural development (1). The primitive man is perfectly aware, perhaps

105 182

1. V. Lebzelter, "Persönlichkeit und Weltanschauung bei den Eingeborenen Südwestafrikas Jahrbuch der Österreichischen Leogesellschaft, 1932.

instinctively, perhaps by tradition, that the quantity of energy possessed by every individual is limited and that each expenditure of energy means wear on the life machine and, hence, the shortening of life. The individual, therefore, strives to attain, with the least possible expenditure of energy, what to his mind represents an optimal adaptation to the conditions of life, and to maintain this state of adaptation with the least possible expenditure of energy. The great difference between European civilization and many primitive cultures, including that of the Bushmen, lies in the fact that European culture as a whole finds itself in an unstable condition, which makes the attainment of an optimal state of adaptation possible to only a few of its members. Bushman culture, on the other hand, represents an optimal state of adaptation that can be automatically attained by each individual Bushman. In its way, therefore, it is more perfect than ours. No other people and no other race, given the same technical means and the same environmental conditions, could achieve a better adaptation. One can even speak of such an adaptation with respect to the spiritual culture. The life of the Bushman is made secure in this life

[23 cont.]

105 and in the beyond by his traditional conceptions, and the preserva-
182 tion of this adaptation, in the spiritual as well as in the material realm, is achieved by means of a strict selection of all the cultural goods offered from the outside. This selection is consciously carried out. Put briefly: the Bushmen have hitherto refused higher
[177] economic forms not because they do not possess the ability to handle them, but because they did not want to adopt them. If the material preconditions collapse, then they adopt, step by step or all at once, totally different ways of life, as is shown by their Bantuization in Ovamboland and probably also by the formation of the Hottentot people through the adoption of livestock raising on the part of a number of Bushman tribes. Their average intelli-
[153] gence is no less than that of any other race. Every Bushman knows
[184] the entire spiritual heritage of his tribe.

Of the same Bushmen, F. Schinz (2) says:

[113] 2. F. Schinz, Deutsch-Südwestafrika, Leipzig, 1891.

181 "The Bushman is always faithful to his master and will follow him anywhere without pay; one need not worry about leaving him alone at the wagon and will rarely have to reprimand him for dishonesty. All travelers and hunters unanimously praise
[593] the great affection that exists between parents and children, which goes so far that the father or mother will sacrifice themselves in order to save their child. I was told [24] by the hunter L. that at the Okovanggo he once witnessed a scene in which a young Bushman, who was one of the members of the hunting expedition, was in danger of being trampled to death by an angry elephant that stormed toward him. At the last moment when his paralyzed companions had already given the boy up for lost, his father sprang forth and flung his throwing club at the forehead of the enormous animal. The elephant now turned against his new attacher and furiously crushed him under his feet, giving the son the opportunity to flee."

[114] My observations are fully in accord with those of Dornan (1)

[113] 1. Dornan, Pygmies and Bushmen of the Kalahari, London, 1925.

MASARWA
OR OVONGGO BUSHMEN

[64 cont.]

600 the beyond one acts the same as on this earth. Like the Namib
769 Bushmen, they throw little stones on the graves and at the same time pray that the spirit of the deceased may bring them luck (Dornan, op. cit., p. 146).

787 Conceptions concerning dreams are tied in with the Lulu
[774] doctrine of conscience. In a dream the other self speaks with the dreamer, and this may be good or bad. The other self may be influenced by enemies and thus do harm to the twin soul.

According to Dornan, the Bantu adopted the oracle sticks from the Bushmen. Every Masarwa carries four or five pieces with him. The female pieces are longer and narrower than the
[825] male pieces. They are made from the hoofs of small mammals,
[824] from wildebeest bones, and fruit kernels. The names of the four sticks are: Chowe, Kao, Daua, Gaichwe. The Masarwa believe
[776] that [65] Thora and Huwe, and perhaps also Khauma, speak through these bones, and Mackenzie (1) states that the Bushmen

[113] 1. Ten Years North of the Orange River, p. 136.

had designated these bones as morimo aa'me (things of God).

The shoulderblade of the springbok is also used for divination by the Masarwa.

606 Among the Masarwa the mother-in-law may not look at
551 her son-in-law and may not mention his name. The wife may say
602 neither the name of her husband nor the names of his relatives.

Finally, concerning the Swamp Bushmen of the Okovonggo
●105 delta, J. Seiner reports:
101 "The Tannekwe have summer and winter villages, as well as boats and goats, and engage in agriculture, fishing, and hunting.
[563] The latter occupations are practiced by the pure Bushmen, whereas half-breeds and the pure Mambukuschu, who were stolen as children and reared by the Bushmen, occupy themselves with agriculture and subordinate tasks.

"The number of racially pure Bushmen among the Tannekwe
[144] may be as high as 60 per cent, but as a result of the slight increase of true Bushmen, which they try to equalize by stealing the Mambukuschu children, they are undergoing a steady decrease, AND RACIAL MIXTURE IS PROGRESSING RAPIDLY.

[65 cont.]

and racial mixture is progressing rapidly. The Bugakwe live in five villages with 220 persons in the western Okovanggo Valley down from the Mahango ford and are in bondage to Libebe, with whom, however, they frequently have quarrels over the amount of deliveries; on the occasion of one such dispute in June, 1905, a Mambukuschu was killed by an arrow. The Garikwe live in eight villages with 430 souls in eastern Ärmellande from the Paliba Swamp to the beginning of the valley, while the Goekwe live in southern Ärmellande west of the river course. Concerning the latter, I found only a winter village with 90 souls, and that north of the mouth of the Namassere on a river island.

"The Goekwe might well be identical with Passarge's Gokwe, whose territory extends from the western edge of the Tauche swampland deep into the Kaukau Veld; the Tschorilo Mountains belong to them. During the rainy season the Tannekwe undertake hunting expeditions in the neighboring steppes. The Hukwe, whose number I estimate at at least 600, are less racially mixed than the Tannekwe, but likewise live in settled villages, from which during the dry season they swarm out in family groups to gather or hunt in the forest steppe as the need arises."

Chapter 8

The Nogau Bushmen of Epukiro

During my stay in the mission station of Epukiro, I had an opportunity for closer contact with the Bushmen who live in a kind of symbiosis with the Betschuana (2). They call themselves Nogau,

2. I have given a detailed report on the Europeanized Betschuana village of Epukiro in Zeitschrift für Ethnologie, Vol. 65 (1933).

specifically ≠no /gna !khou, that is, people who live by the water. They are farther north of the Omuramba Epukiro toward Alexeck. North of them are the Gai-kwe, and the !Kung are farther east and

AFRICA

JOURNAL OF THE INTERNATIONAL AFRICAN INSTITUTE

VOLUME XXVII JANUARY 1957 NUMBER 1

THE KIN TERMINOLOGY SYSTEM OF THE !KUNG BUSHMEN

LORNA MARSHALL

THE Peabody Harvard Kalahari Expedition, under the leadership of Laurence K. Marshall, has made four field trips between 1950 and 1955 into the Kalahari Desert in South West Africa and the Bechuanaland Protectorate to find and study Bushmen who were living in their own way, and not working for white farmers or for Negroes. The last of the four expeditions, that of 1955, was sponsored by the Smithsonian Institution as well as by the Peabody Museum of Harvard. 121 122

Our principal study was made with the /Kung Bushmen of the Nyae Nyae region of South West Africa. The Nyae Nyae region extends about 150 miles north and south, about 100 miles east and west, and is centred approximately at Gautscha Pan, which is located at *c.* 19° 48′ 30″ S. and 20° 34′ 36″ E. on the map of a survey of the area by the Administration of South West Africa dated 7.11.1935. The Nyae Nyae region is separated from the farmed areas of South West Africa by a stretch of waterless, uninhabited country over 100 miles wide. 131

We chose the /Kung of the Nyae Nyae region for concentrated study because they are the least acculturated Bushmen we found.[1] They are non-literate, nomadic hunters and gatherers, with no agriculture or domesticated animals. They are completely self-reliant [121] 105 177

[1] On the expeditions we travelled extensively in South West Africa and the Bechuanaland Protectorate. The groups of Bushmen we encountered were, in addition to the /Kung of Nyae Nyae, /Kung outside the Nyae Nyae region at Karakuwise, Nuragas, Khadum, and at water holes south of Gum in South West Africa, and at Kai Kai, Kubi and other places along the western border of Bechuanaland, where Chwana and Herero have cattle posts; Makaukau and Naron near Ghanzi, B. P.; /Kõ at Okwa and at Barachu, about 50 and 100 miles south of Ghanzi respectively; /Gikwe about 100 miles south-east of Ghanzi in the trackless sandy plain that lies between Ghanzi and Molepolole, where during the dry season there is no water; and //Ganakwe still farther south, below Chukudu. We studied the kinship terminology of the /Kõ and /Gikwe; Professor L. F. Maingard, for a time a member of the 1955 expedition, studied the /Kõ language, which has the labial (fifth) click of the southern group. [101]

Professor I. Schapera and Miss D. F. Bleek, in their Bushman studies, record information on these groups. For more data on the various names by which the groups are known and the areas in which they were found and the language groups into which Miss Bleek's studies place them, see especially Schapera, *The Khoisan Peoples of South Africa*, New York, 1951, pp. 31 ff., and Bleek, D. F., 'The Distribution of Bushman Languages in South Africa', *Festschrift Meinhof*, pp. 55 ff.

'Africa', the Journal of the International African Institute, is published by the Institute, but except where otherwise stated the writers of the articles are responsible for the opinions expressed.

128 Diagrams will be given to illustrate the homonymous method of applying terms,
601 but they do not illustrate a typical family. No Bushman family we know has as many
162 living children as in Diagram 4. Bushmen are completely nomadic and must carry
105 their young children and all their possessions, walking seventy or eighty miles or
847 more as they move from one wild crop of roots or nuts to another. They limit, by infanticide, the number of infants to those they can carry and care for. ≠Toma, one of our informants, helping me one day to construct one of these hypothetical illustrations, laughed and said, 'Who is this who has so many children? Is it an ostrich?'

Diagram 2

601 In this illustration ego's */gu/na* is his FaFa. Ego's FaBr and FaSi are the So and Da of his */gu/na*. They and ego use the adjacent generational terms, *tsu* and *//ga*, for each other.

Diagram 3

Here ego is named for his FaBr. In this case ego's FaFa is ego's */gu/na*'s Fa and ego's FaMo is his */gu/na*'s Mo; *tsu* and *//ga* are the terms used. Ego's FaBr and FaSi are the Br and Si of ego's */gu/na*; the sibling terms are used. Ego applies the term *tũn* to the wife of his */gu/na*.

Diagrams 2 and 3 illustrate ego's application of terms to members of his */gu/na*'s family. Letters represent names. A person who is designated by the same letter as a person in a generation above him has been named for that person. The naming is customary and correct as far as it goes. Some of the children would be named for their mother's parents or siblings, but, as those persons would be ego's affines, until the affinal terms are given this aspect of the illustrations will be postponed.

There is a secondary application of the terms originally applied by ego to members of his */gu/na*'s nuclear family and spouse. Ego applies terms to persons who are named for the latter, and continues during his lifetime applying to persons descending from

5:Marshall E-5 (1950-1955) 1957 FX10 Bushmen FX10
Kung

method had been established. The /Kõ and /Gikwe have not incorporated the belief into their terminological systems except in a very limited way. The /Kung, however, have done so, and appear to have adapted it as logically as possible to the generational method. They apply it only to somewhat distant relationships, namely, grandparents, grandchildren, collaterals, secondary affines, and name-relatives. They do not apply it in the close biological relationships of parent, offspring or sibling or in the primary affinal relationships. Consistency is maintained by the rule that a child must not be named for a parent.

We think that the term *!gu!na* came into the system with the homonymous method and that perhaps it used originally to be applied only to the person for whom ego is named. It is not strictly a kinship term, being composed of translateable words, ' big or old name '. We think it may have been superimposed upon *tun!ga* (which probably comes from the same root as *tũn*). *Tun!ga* may originally have been applied to grandfather, man-speaking as well as woman-speaking, and later *!gu!na* may have become associated with grandfather because so many men are named for their grandfathers. If this is so, an anomalous situation remains unresolved. *Tun!ga* is applied to consanguineous kin and affines and allows joking, woman-speaking. Man-speaking, it is applied only to affines and prohibits joking. If it was originally the term for grandfather, man-speaking, we reason that it should allow joking, and we cannot explain this anomaly.

Whatever may be the answer to these questions, the /Kung have put to good use the belief that persons who have the same name partake of each other's entities. This belief has given them the name-relationship.

It is our impression that the practice of applying terms to name-relatives has appealed to the /Kung and that they have developed it to the full. The /Kung apply a kinship term to every /Kung they meet or almost everyone. /Qui was the only informant who worked with us on this subject who had ever met a /Kung Bushman for whom he had no kinship term. He had met four who came from a distance and whose names were not among those commonly used in the Nyae Nyae region. Ta//ne was one of the names. Gao, who was present, told /Qui that he had a *tsu* named Ta//ne, and he and /Qui nodded together in agreement that they would find a way for /Qui to give Ta//ne a term should they meet again. We know two men who used the term *!go* for each other because each of them had a brother named Dam. The system seems to have been flexible and expansive in the application of terms to name-relatives.

The /Kung are small of stature and non-aggressive. They are timid and apprehensive of strangers. Their word for stranger is *ju dole*. *Ju* means person, *dole* means strange or harmful—one word for both concepts, in the /Kung language, as though they were a single concept. The /Kung have no social organization larger than the band of kin who live together but they have utilized the name-relationship to supply the cohesive factor which is supplied in other societies by various social structures. When a /Kung meets a stranger and finds that he has the same name as one of his kin and bestows a kinship term upon him, he is reassured and feels a sense of belonging.

Gao, the brother of /U, went on an errand for us to Khadum. Khadum is about 115 miles north of Gautscha and about 40 miles north of Chô/ana where we were staying at the time. He had never been to Khadum before, and the /Kung Bushmen who lived

N/OW

LORNA MARSHALL

N/ow[1] is a belief concerning rain and cold which is held by the /Kung Bushmen in the region around Nyae Nyae in South West Africa.

About ten inches of rain falls in an average year in this part of the Kalahari Desert and sinks into the deep sands. There is no run-off in streams and there are few water holes. The rain is sufficient to support a covering vegetation of grass, shrubs, and scrubby trees. The vegetation includes numerous edible roots, tubers, leaves, fruits, and nuts, for which the Afrikaans language provides the convenient word *veldkos*.

The /Kung, the only inhabitants of the interior of this particular region, are nomadic hunters and gatherers. If the rains are poor and the veldkos dry and sparse, the people suffer. Rain, they say, is life-giving; sun is death-giving.

Summer is the season of the 'big rains' in the western Kalahari. 'Little rains'—a few scant showers—may fall in September, October, and November. The 'big rains' begin in late December or January and continue into March. The summer storms are awesome. Every day the winds drive monstrous clouds around the sky, which domes a horizon as flat as the sea. They breed the storms. Lightning streaks from them. Thunder roars and rumbles. The earth sucks in their deluges, hissing.

The /Kung say that thin clouds which give no rain are male. They call them */now*.[2] The big rain clouds are female. White ones they call *//ga kwe disi*—*//ga* means cloud or rain, *disi* means females.[3] The enormous grey clouds with rain pouring from them the /Kung call */kwesi* (zebras), because they are so fleet and, though a person may think he is far from the rain, it comes swiftly and is on him. We have seen Bushmen, caught without shelter in the storms, shivering so that their teeth chattered, saying they could perish in such rain.

Rain itself is male and female, */ga /go* and */ga di*. The men one day drew in the sand the spoor of male and female rain. Male rain spoor was made with all five fingers held stiffly and plunged deeply into the sand, to make big holes. Male rain breaks the trees and beats down the fruits, the men told us. It is (like) a fight, and may kill a person. Thunder and lightning accompany it, and sometimes hail. Female rain has tiny drops and does not spoil anything; it beautifies the trees and the grass and makes the veldkos grow. Its spoor was made by smoothing out a place in the sand and covering it closely with tiny dots. Gao said a person (anyone) may speak to the rain, saying, 'You are doing very well', or, 'Fall silently. Don't make such a noise. Don't be

[1] We wish to thank both Dr. Mary Douglas and Professor I. Schapera for reading the manuscript about *n/ow* and for making several helpful suggestions.

[2] The /Kung language has four clicks: / is the symbol for the dental click, ≠ for the alveolar, / for the alveolar palatal, and // for the lateral.

[3] We did not know how to translate *kwe*, which occurs very often. It seemed sometimes to be a sort of article and we did not work on it especially. We regret not having done so because Miss Bleek, in her *Bushman Dictionary* (American Oriental Society, New Haven, Connecticut, 1956), records in the Auen or //K"au-//en language, which she says is very like the /Kung and which she places south of the /Kung, the phrase */ga -k"wisi*, meaning rain's hair or cloud. In /Kung */ga* and *//ga* both mean rain. We now wonder if *kwe* should be *kwi* and if it means hair in the phrase *//ga kwe disi*.

609 pering in the grass near by. You can tell by these werfs that
621 there are Bushmen in an area, and also by their footprints on narrow trails which they share with the game and which run all through the desert. You may find footprints or you [312] may see a little pile of white ash, the fire that a Bushman kindled where he spent the night. Otherwise, to find them you must depend on luck or on the fact that the Bushmen of an area may have heard something good about you and will not be too afraid.

105 Culturally and historically, the Bushmen are an interesting people, for they and the Hottentots, who belong to the same racial and language groups, are the earliest human inhabitants still living in southern Africa. There are now from thirty [161] to fifty thousand Bushmen, who are divided into several language groups. Their languages are related to each other and [197] to the Hottentot language, and are in what is known as the Khoisan language group, made up of most of the click languages spoken in South Africa. A click language has sharp pops and clicks made with the tongue in various parts of the mouth, combined with an implosion of the breath, very diffi- [194] cult to understand, harder still to pronounce, as the slightest mistake may change the meaning of a word entirely. For example, the work *//kx'a*, which in one of the Bushman languages means *mangetti*, a certain kind of nut-bearing tree, is pronounced by making a lateral click for which the tongue is pulled sharply away from the sides of the mouth, producing the click one makes when calling a horse, followed by a scraped *k* turning to a g, followed by a glottal stop—a slight pause or tiny choking sound made as the back of the tongue stops the breath—which is followed at last by the vowel. To make a mistake is easy, and that is why non-Bushmen have a hard time learning the language, and why, when they do learn, they are often misunderstood.

9: Thomas T-5 (1951-1955)1959
FX10 Bushmen FX10

The Bushmen are one of the most primitive peoples living 105
on earth. Although most of their groups own some metal objects, Bushmen do not smelt or forge metal, but get it in trade [325
from their Bantu neighbors. They use soft metal in the mak- 439]
ing of a few tools such as knives, arrowheads, and little axes, cold-hammering the metal into shape themselves. Bushmen make the other tools they use from wood and bone, grass and fiber, the things of the veld. They dig roots and pick berries [222]
to eat because they have no crops. The desert is too dry for anything but desert plants to grow naturally, and Bushmen, who quickly consume all the wild food available in one place, cannot stay anywhere long enough to tend crops or wait for them to grow.

There is not enough water to water livestock, and for this [231]
reason Bushmen have no domestic animals. Most of their groups do not even have dogs. Instead of herding, Bushmen hunt wild antelope with tiny arrows, sometimes made of soft, [224
traded metal, sometimes made of bone, and poisoned with a 278]
terrible poison extracted from a certain grub, a poison which affects the nervous system of a creature and which is so deadly that an antelope shot early in the morning with a single arrow well placed in the body dies within the day. Hunting is very difficult, for travel in the veld is thirsty and rigorous and the antelope are clever, but as often as not the Bushmen hunters shoot one and then they use it all. Most of the meat is dried [251]
to preserve it, causing it to last at least a few weeks, but sooner or later every last bite of it is eaten, even the mucous lining of the nostrils and the gristle inside the ears. They [262]
sometimes eat the hide, sometimes work it into leather to use for clothing, and if the antelope bones are not all [281]
cracked for the marrow, pieces are worked into arrow points to shoot another antelope.

In order to live as they do, Bushmen must travel through 105 361

9: Thomas T-5 (1951-1955)1959
FX10 Bushmen FX10

105 the veld, changing their abode every few days in search of
361 food. Because of their way of life, they do not need villages to live in, so they rarely bother to build strong scherms, making small domes of grass for themselves instead, just a little shade for their heads, grass which the wind soon blows away. Sometimes they do not even bother with this, but push little sticks into the ground to mark their places. They sleep beside the sticks and arrange their few possessions around them, symbols of their homes.

105 Although Bushmen are a roaming people and therefore
361 seem to be homeless and vague about their country, each
823 group of them has a very specific territory which that group
[621] alone may use, and they respect their boundaries rigidly. Each group also knows its own territory very well; although it may be several hundred square miles in area, the people who live there know every bush and stone, every convolution of the ground, and have usually named every place in it where a certain kind of veld food may grow, even if that place is only a few yards in diameter, or where there is only a patch of tall arrow grass or a bee tree, and in this way each group of people knows many hundred places by name. Even if you are traveling randomly with Bushmen and ask at any time on the journey for the name of the place where you happen to be standing, they will probably be able to tell you. They themselves always like to know exactly where they are.

105 The social structure of Bushmen is not complicated. They
621 have no chiefs or kings, only headmen who in function are virtually indistinguishable from the people they lead, and sometimes a band will not even have a headman. A leader is not really necessary, however, because the Bushmen roam about together in small family bands rarely numbering more than twenty people. A band may consist of an old man and his wife, their daughters, the daughters' husbands, perhaps an

9: Thomas T-5 (1951-1955)1959
FX10 Bushmen FX10

unmarried son or two, and their daughters' children. Bush- 105
men are polygynous, and a man is allowed by custom to have 621
as many wives as he can afford, depending on how well he [595]
hunts—usually a man can afford only one wife, sometimes two (often a pair of sisters), and once we heard of a man with four wives. For this reason there are often more women than men in a band.

The immediate family, a man, his wife, or wives, and chil- 105
dren, is the only solid social unit; otherwise the small bands 592
are always breaking up and recombining with other small 621
bands as the structures of single families change, through marriages, divorces, deaths, or as the family decides to pay a prolonged visit to a different group of relatives.

Any Bushman will either be related by blood or marriage 105
or will be acquainted with all the other Bushmen in his area 602
but this is as far as Bushmen go in their affinities. They do 609
not recognize as their own people strange Bushmen who speak the same language; in fact, they suspect and fear them as they do any stranger.

We have visited four of the Bushman language groups, two 114-
of which we stayed with for long periods of time. In 1951, 131
after a survey expedition to learn where Bushmen could be found, we went into the Nyae Nyae area of South-West Africa, close to the border of Bechuanaland, to look for Kung Bushmen. We found a band living near a waterhole, as it was June, the drought of the year, and we stayed with them for four months. At first only a few Bushmen were there, but as [609
the news spread that we were friendly, more and more peo- 276]
ple came to visit us and receive presents of tobacco and salt, for Bushmen love to smoke but rarely have tobacco, which they get in trade. Also, most of the Bushmen had never seen a European before, none had ever seen a European woman, and they came by dozens to sit together in a cluster

9: Thomas T-5 (1951-1955)1959
FX10 Bushmen FX10
Kung

133 open and tilting, but the low hills and the forests veiled the great sweep of country, and the sun, the moon, and the horizon.

105 As soon as we were there we felt very familiar, very at 184 home. We knew quite a lot about Kung Bushmen, who in ways are different from Gikwe Bushmen—as the country is not as harsh, the Kung are a little grander, living together in larger numbers because they have veld food more abundantly, a little more extravagant with their time and their possessions. They build themselves grass huts or scherms, at least during the rains, and though they know vast sections of their country perfectly, being quite sure of the whereabouts of game and certain of the whereabouts of different types of veld food, they do not have to memorize the whereabouts of each root individually and store this information in their minds for future seasons, as the Gikwe do. The Kung are diligent and powerful hunters, although in some respects their country is harder to hunt in than the land of the Gikwe, more overgrown with brush and trees. But the Kung have metal-tipped arrows and complicated poison, and the men make a point of hunting often and well because their people love meat.

312 We knew their rolling veld with its baobab trees and hidden waters, for in Nyae Nyae the people do not have to scrape roots and suck melons, but are the possessors of deep waterholes where they can drink clear water almost all year long. We knew which stalks among the grass blades marked edible roots, and where game antelope might be found.

823 We knew not only the veld but the beings that live in the 776 sky above it, and knew the beings under the earth and in the four directions. We knew where the great god lives in the east with his tree and his medicine smoke with which he makes spirits of the dead from dead people. We knew his names, for

10: Bleek E-5 (no date) 1924
FX10 Bushmen FX10
Naron

Brother and sister are the only relations who are forbidden to marry, and by this, real brother and sister are meant, the children of one father and mother, not cousins. I never heard a title for any cousin, however related, though several were present Cousins sometimes marry, but more often a bride from a distance is procured. 582

A pair of sisters have a very close relationship. They are generally chums, and help each other with their babies. A child calls its mother's sister its "little mother". In speaking of the occasional bigamy found among the **Naron** in contrast to other Bushman tribes, an old man said to me: 593 [601] [604] 595

"A man may take a second wife, if he wishes. If they agree well, they live in one hut; if not, each makes herself a hut. A man had better take his wife's younger sister as his second wife; then they do not quarrel, but live in one hut."

Ikka in **Ikaihe** "maternal aunt" may be derived from **Ikai** "together". **Ho** used as a verb means "to marry", also "to give birth to children". **Ti kweba** and **ti kwesa** mean simply "my man", "my woman"; they are more often used than **hoba** and **hosha**. 196 601

A widow may marry her late husband's brother, but need not do so. She is quite at liberty to marry any other man. If she remarries, her husband is expected to look after her children; otherwise the duty falls upon their father's brother. The widow may stay near her husband's people, or return to her own people, as she pleases. 587 [604]

Grandparents, particularly on the mother's side, are very fond of adopting a grandchild. They will half adopt one, even during both parents' lifetime. The grandmother is generally the person who teaches a child to speak. 597 603 [868]

In concluding these notes on the tables of relationship, I should like to say that I know they are very incomplete. At the time of my stay among the **Ikau Ien** and **Naron** I had not realized the importance of this side of native life; nor apparently had my aunt, Dr. Lloyd, whose work I rely on for the **Ixam** and **Ikáŋ** tables. Still, I think sufficient has been collected to show the general trend of Bushman family ties. 114

One must always remember, that people depending on nature for their entire food supply, can only exist in very small, widely scattered groups. Families cannot be large. Drought and famine 105 161

[Text continues on page 70]

10: Bleek E-5 (no date) 1924
FX10 Bushmen FX10

105 [161] keep the numbers down. No one has a large number of uncles and aunts, or cousins. There is not a large public, whose opinion would enforce keeping laws strictly. Individual liberty is therefore far greater than can be the case with any tribe with large numbers living in crowded villages. Extremes meet, and we find in the most primitive society a family life far nearer our own than in many intermediate stages. The woman is her husband's partner rather than his property. The family consists of parents and children, and breaks up with the parents' death. There are no chiefs: society is ruled not by law, but by custom interpreted by individual sense of fitness. A very few things are felt to be wrong, everything else is permitted. The Bushman is first and last a lover of liberty.

105

Identification

The Auen (//k'au//en) are a Bushman tribe. Their language belongs to the Northern division of the Bushman branch of the Khoisan or Click linguistic family.

Basic Economy

The economy is based primarily and about equally on hunting and gathering. There is no agriculture or animal husbandry.

Sex Division of Labor

The men hunt. The women gather.

Property

Each band owns collectively a definite hunting territory.
Inheritance is patrilineal--by ElSo.

Social Stratification

Both slavery and class stratification are absent.

Marriage

A bride-price is lacking. A groom gives gifts of gamé, etc., to the bride's parents--a sort of bride-service--over a period of about a year.

Polygyny is common, but monogamy prevails near Rietfontein. Each co-wife has a separate hut.

Family

The polygynous family is the normal residential unit; or perhaps the nuclear family.

Residence

The matri-patrilocal rule prevails. A man resides with his wife's band for some time, even until the birth of the first child, but then removes to his own band.

Kin Groups and Exogamy

There is a definite tendency toward local exogamy.

105

Cousin marriages are permitted.

Descent is bilateral. Unilinear kin groups are absent.

Kinship Terminology

Fa--ba. Mo--tai. Ch--!hã. Br--tsĩ. Si--tsitsi. Hu--!kwã. Wi--dzou.

Avuncular terms are basically bifurcate collateral, nepotic terms lineal.

Cousin terms are of Eskimo type.

Settlement Pattern

The Auen live in migratory bands. The typical dwelling is a windbreak consisting of a few branches stuck in the ground in a semicircle, tied at the top with twigs, and roofed with grass.

Community Organization

Socially, a band approximates the structure of a patri-deme.

Local Government

Each band has a headman, who is a war leader but exercises only slight authority.

State

There is no political integration above the local level.

Warfare

The Auen are warlike.

105

Identification

The Heikum [Hei-//om] include various groups of Bushmen adjacent to or interspersed among the Ambo, and much mixed with and acculturated to the latter. They speak Nama Hottentot rather than Bushman.

Basic Economy

Hunting and gathering only except where Bantuized, with vegetable food rather more important than game. The Daman group, adjacent to the Ambo cultivate a little and tend a few goats.

Sex Division of Labor

The men hunt; the women gather. Among the Daman, the women keep gardens and boys tend goats.

Marriage

No true bride-price; the groom makes small presents to the bride's parents. Among the Daman the groom provides a few goats or an ox for the wedding feast.

Polygyny is general. The co-wives may or may not be related. Each wife has her own hut.

Family

Presumably polygynous families are the norm.

Residence

Initial matrilocal residence for a few months. On taking a second wife, a man sets up a household of his own. Permanent residence is patrilocal (perhaps neolocal).

Kin Groups and Exogamy

Local exogamy prevails.

Fourie says marriage is forbidden with a sister, a niece, and any first cousin. For the Daman, Lebzelter reports marriage permitted with any cousin except FaSiCh; this dubious. For the Bushmen in the western Ambo country, Lebzelter reports marriage permitted with FaSiDa, forbidden with MoSiDa, probably forbidden with FaBrDa and MoBrDa.

Bilateral descent is probable. Fourie reports that there are no unilinear restrictions on marriage.

105

Kinship Terminology

[Terms by Werner and Lebzelter, the latter in brackets; Lebzelter's terms are for the Bushmen deep in western Ambo territory.]

Fa--ombā [//khum-khe]. So--daba !oma [a χ'oroh-khe]. Da--ďaba !tsauma [χ'ams-khe]. Mo--mdei [//khums]. Br--tsng [!gasab]. Si--tsau tsng [di !gas-khe]. Hu--tschu n!o [aubā]. Wi--tsau [tarás].

GrFa--omba n!ā ("old Fa"). GrMo--tschau !ā ("old woman"). FaBr--[di khoáb-khe]. MoSi, FaBrDa, MoBrDa, BrWi, WiSi--[//khum khoás]. FaSi--[di-khoaba].

FaBrSo--[awób !garis-khe]. MoBrSo--[!góa khoaba].

Settlement Pattern

Migratory bands. Huts pitched in a circle around a large tree, with a sacred fire nearby. The band wanders seasonally, but has a permanent camp site near a main water source. The hut is a semicircle of branches planted in the ground and covered with grass. Werner mentions dome-shaped, grass-covered huts.

Community Organization

The band includes people related in various ways to the headman. One sketched by Fourie included huts of sisters, of brothers, of daughters, and of other band members. Lebzelter speaks of exogamous "Sippen."

Local Government

Each band has its own territory and headman. Lebzelter reports succession by ElSiElSo, but Schapera doubts this unless as a result of Ambo influence.

State

No political organization above the band level.

Warfare

There are blood feuds over trespass, theft, and adultery.

Werner, H. Anthropologische, ethnologische und ethnographische Beobachtungen über die Heikum- und Kungbuschleute. Zeitschrift für Ethnologie, XXXVIII, 241-268. 1906. Nk10. Z37. v. 38. [Has very little on Heikum except some kinship terms.]

105

Identification

The Hiechware (Masarwa, Tati) inhabit Bechuanaland, the Kalahari Desert, and adjacent Southern Rhodesia. They live mainly among the Tswana, who employ them as hunters, trappers, and herders. Their huts are made of branches stuck in the ground in a semicircle, laced or tied together at the top, and covered with grass or skins (occasionally with mats). They speak a Khoisan language of the Central division.

Basic Economy

Hunters and gatherers. No agriculture is practiced, nor are any domestic animals kept: Fishing is done where possible.

Sex Division of Labor

Men hunt and fish; women do most of the gathering.

Marriage

No bride-price. A groom catches a large animal and presents it to bride's Fa. Postmarital bride-service is performed.

Monogamy predominates, but some polygyny occurs.

Family

The isolated nuclear family is the norm.

Residence

A groom resides for 2-3 years with his WiFa, doing postmarital bride-service. Thereafter residence is inferentially patrilocal.

Kin Groups and Exogamy

Local exogamy apparently is not prescribed. "A man can take another woman of the same clan, but she must not have the same totem as himself."

The Hiechware have "totems" (presumably patrilineally inherited), especially where they are in closest contact with the dominant Tswana tribes, from whom unilinear descent has presumably been borrowed. Comparative Bushman data indicates that unilinear descent is not aboriginal.

105

Kinship Terminology

Fa--bae. Mo--mae (mara or mashe for "my Mo"). Br--chwaho. Br(w.s.)--gweke. Si (w.s.)--gweke. So or Ch--/gwa. Da--//gai /kwa. Hu or Wi--//gaicho.

Avoidance of WiMo.

Settlement Pattern

Nomadic bands, which are small, rarely numbering more than 4 families.

Community Organization

The band is not a kin-community, for "In the same clan there might be several different totem families."

State

There are no tribal organization or paramount chiefs. The Hiechware are mostly dependents of the Tswana.

Bibliography

Dornan, S.S. The Tati Bushmen (Masarwas) and Their Language. Journal of the Royal Anthropological Institute, XLVII, 37-112. 1917.

•105

Identification

The Kung (!kung) Bushmen, embracing the Agau, Nogau, and /kungau tribes, belong to the Northern branch of the Bushman subfamily of the Khoisan linguistic stock. They are closely akin to the Auen. Wilhelm estimates their population as between 3,000 and 4,000. Men average 155-160 centimeters in stature, women 140-150.

Basic Economy

Agriculture and animal husbandry are lacking. Subsistence depends primarily on hunting (with poisoned arrows) and gathering (of roots, termites, etc.). There is a very little fishing.

Sex Division of Labor

Hunting is done by men alone, gathering largely by women.

Property

Each band has its own territory, which is collectively owned.

Wilhelm reports patrilineal inheritance, with the ElSo as chief heir. Older sources, however, say that most of a man's possessions are buried with him but that his brother inherits his bow and arrows.

Social Stratification

Slavery and social classes are absent.

Marriage

Infant betrothal is common. Premarital license not permitted. Few gifts are exchanged, and there is no bride-price or other property transaction, but postmarital bride-service is required. Girls marry before puberty, boys much later, when they have become hunters.

Wife lending occurs, but there are no licensed sex relationships. The first wife has a slightly higher status. Sororate and levirate are preferential, but secondary unions are forbidden with a parent- or child-in-law, the spouse of an avuncular or nepotic relative, BrWiMo, SoWiSi, WiBrWi, HuSiHu.

Family

The household unit is a nuclear family.

•105

Residence

A newly married couple live with the bride's family for a year or more, shifting to the groom's band after the birth of the first child.

Kin Groups and Exogamy

Local exogamy prevails.

There are exogamous kindreds, embracing ascendants, descendants, siblings of parents, children of siblings, and first, second, and third cousins.

Descent is bilateral. Except for exogamous bands (patri-demes) there are no unilinear kin groups. For the Kung of Otjimpoland, Lebzelter reports that marriage is forbidden into the band of either parent.

Kinship Terminology [terms from Marshall except B for Bleek, L for Lebzelter, W for Werner]

Fa--ba [also B], mba [L], omba [W]. Mo--dai, tai [B], medei [W], aiya [address], aje [L]. ElBr--!go, //kò [B]. YoBr, YoSi--tsi, sing [B], tsng [W]. ElSi--!kwi, //khuî [B]. So--!ha, //ha [B]. Da--≠khai, ≠xe [B]. Hu--!hoa, !kao [B], tschu n!o [W]. Wi--tsau, zau [B], tschau [W].

FaBr, MoBr, MoSiHu, FaSiHu--tsu, tsung [B], mzu [L]. MoSi, FaSi--//ga. BrSo, SiSo, HuBrCh, WiBrCh--tsuma (der.), txu //gama [B]. GrFa(m.s.), elder male cousin--!gu!na, !ku/nue [B]. GrFa(w.s.)--tun!ga. GrMo--ton. GrSo--!guma, gama //ge [B]. GrDa--toma. GrSo(w.s.)--tun!gama, txu//gama [B]. WiFa, HuFa, DaHu--≠tum, ≠kum [B]. WiMo, HuMo, SoWi--/utsu.

Grandparental terms used for all cousins. The kinship system is thus of Eskimo type. This is, however, obscured by the naming pattern [see special sheets]. All relationships are associated with permissible joking on sexual matters or with the prohibition of such joking [see special sheets].

Settlement Pattern

The Kung live in migratory bands, which average about 25 persons. In temporary camps they erect their huts in a circle or semicircle around a dancing place. Dwellings are round in ground plan and

105

hemispherical or conical in shape, consisting of boughs set in the ground in a circle, tied together at the top, and covered with grass.

Community Organization

The band is a patri-deme. Genital mutilations are inferentially absent.

Local Government

Each band has an old man as a leader. Lebzelter alone reports that headship is hereditary from Fa to So and is associated with tending a sacred fire.

State

There is no political integration above the local level.

Warfare

Interband feuds occur, but there has been no war for a century. The Kung feud with the Heikum.

105

Identification

The Namib Bushmen include the following tribes: /geinin, //obanen, /koma, ≠ganin, /huinin. They all speak the Nama Hottentot language.

Basic Economy

Exclusively hunters and gatherers. Wander in Namib desert in wet season; stay in mountains in dry season. Practice no agriculture or animal husbandry.

Sex Division of Labor

The men hunt; the women gather.

Property

Waterholes and specific territories are collective band property.
Inheritance by widow; after her death by ElSo.

Social Stratification

War captives kept as semi-slaves. No noble class. Schmidt says no slavery.

Marriage

Presents of game, skins, etc. to girl's parents, but no true bride-price.

Trenk and Lebzelter report strict monogamy. Seydel reports polygyny; Schmidt reports limited polygyny with never more than 2 wives (in one hut).

Family

Nuclear family the norm.

Residence

Patrilocality prevails.

Kin Groups and Exogamy

No rule of local exogamy.
Marriage permitted with first cousins; forbidden with siblings.

105

The "sibs" reported by some authors are probably only bands (Schapera).

Kinship Terminology

Fa, WiFa, HuFa--dadáb. Mo, WiMo, HuMo--mamas. Grandfather--//naob.

Settlement Pattern

Migratory bands. Dwellings chiefly caves and rock shelters; some rude huts.

Community Organization

Bands include related families (Schmidt); Lebzelter remarks on supra-family bands.

Local Government

Hereditary local headmen. Succession by any son selected by household heads.

State

No paramount chiefs or political organization transcending the band.

Warfare

Cattle stealing reported.

Bibliography

Lebzelter, V. Eingeborenenkulturen in Südwest- und Südafrika. Leipzig, 1934. (A few items of information.)

Schultze, L. S. Aus Namaland und Kalahari, pp. 98-105. Jena, 1907. (Scraps only.)

105

Identification

The Naron (//aikwe), with whom are included the Tsaukwe, Tsonokwe, ǂamkwe, and !giŋkwe, belong to the Central Bushman division of the Khoisan linguistic stock.

Basic Economy

The Naron are hunters and gatherers without agriculture or animal husbandry. Their staple foods are game and wild vegetables. They even had no dogs originally.

Sex Division of Labor

The men hunt; the women gather.

Property

Each band has its own collective territory, which any member can exploit.

A man's personal possessions are buried with him.

Social Stratification

There is no slavery or significant social stratification.

Marriage

Marriage is nominally by capture, but almost always there is a preliminary arrangement with the girl's family involving presents of large game.

Limited and preferably sororal polygyny prevails. Co-wives live in one hut if they agree well; otherwise in separate huts.

Family

The nuclear family is the residential norm.

Residence

Matri-patrilocal residence prevails. The young couple normally resides with the groom's family for a few months, then with the bride's family until the birth of the first child, thereafter permanently in the groom's band. Permanent matrilocal residence occurs in some instances.

105

Kin Groups and Exogamy

Local exogamy is the rule.

Marriage is permitted with any first cousin, though such unions are infrequent.

Descent is bilateral.

Kinship Terminology [Bleek]

Fa--//kub, auba. Mo--//kusha. So--//kuba. Da--kusha. Hu--hoba. Wi--hosha.

Bifurcate collateral avuncular and nepotic terms.

Settlement Pattern

The Naron live in migratory bands. Huts are constructed of branches set in the ground in a semicircle with the tops bent and tied together and thatched with grass.

Community Organization

The band is apparently a patri-deme in structure.

Local Government

There are local headmen, normally succeeded by a son.

State

There is no political integration above the level of the band.

Bibliography

Bleek, D.F. Bushman Terms of Relationship. Bantu Studies, II, 57-70. 1924.

-----. The Naron, Cambridge, 1928. (The principal source.)

Passarge, S. Die Buschmänner der Kalahari. Berlin, 1907.

105

Identification

The Xam (Cape Bushmen, /xam) are a Bushman tribe speaking a language of the Southern division of the Bushman branch of the Khoisan or Click linguistic family.

Basic Economy

Subsistence is achieved primarily by hunting and gathering, supplemented by some fishing. Agriculture is lacking, and the dog is the only domesticated animal.

Sex Division of Labor

Hunting is done by men, gathering by women.

Social Stratification

Slavery and differentiated social classes are lacking.

Marriage

A true consideration is lacking. Marriage is arranged by gifts, especially game secured for the wedding feast. There is postmarital matrilocal bride-service.

Limited polygyny prevails. Bleek reports monogamy, but the early sources clearly indicate that some polygyny occurred.

Family

The normal residential unit is apparently an independent nuclear family.

Residence

Residence is initially matrilocal, with bride-service, for a considerable period. Permanent residence is apparently optionally matrilocal or patrilocal.

Kin Groups and Exogamy

Marriage is permitted with any first cousin, but such unions are infrequent.

Descent is bilateral. Unilinear kin groups are absent.

105

Kinship Terminology

Fa--oa. Mo--xoa. So--Θpwɔŋ. ˜Da--Θpwaxai. Br--//kã. Si--//kaxai. Hu--/ha. Wi--/aiti.

Avuncular terms are apparently bifurcate collateral. Nepotic terms are descriptive and thus bifurcate collateral.

Cousin terminology is probably, though not certainly, of Hawaiian type.

Settlement Pattern

The Xam live in migratory bands. Though caves and rock shelters are often used, the typical habitation is a simple windbreak of branches stuck in the ground in a semicircle and covered with grass or grass mats.

Local Government

Each band has a nominal headman, inferentially with little authority.

State

There is no political organization above the local level.

Chapter I

THE COUNTRY OF THE KHOISAN

H
B
101

By the year 1652, when the establishment of the pioneer Dutch settlement at Table Bay laid the foundations for the present political dominance of the white man in the country, Africa south of the Zambesi River was already inhabited by a considerable number of different native peoples. On the basis of racial, linguistic and cultural distinctions, these native inhabitants are customarily classified into four separate groups, known respectively as the Bushmen, the Hottentots, the Bergdama, and the Bantu.

B
101
105

The Bushmen, at one time spread over almost the whole of South Africa, are to-day confined principally to the Central and Northern Kalahari Desert and adjacent districts. They are a short, brownish-yellow people, with certain peculiar and distinctive racial characteristics; they all speak languages of a uniform and easily recognizable type, phonetically remarkable especially for the great prevalence of "click" consonants; and they live in small nomadic bands which lead a purely hunting and collecting existence, practising neither agriculture nor pastoralism.

H
101
105

The Hottentots formerly occupied most of the western half of the region, but are now found chiefly in the southern parts of South-West Africa. They are closely allied to the Bushmen in race, and their languages are of a somewhat similar type, although in both respects certain differences are also observable. They are, however, a predominantly pastoral people, keeping cattle and sheep, and live in larger communities with a more complex system of social organization.

The Bergdama, also inhabiting South-West Africa, are racially a true negro people, different in appearance from both the Bushmen and the Hottentots. They all, however, speak the language of the Nama division of Hottentots, to whom they have long been in subjection. Like the Bushmen they live in very small nomadic groups and derive their subsistence primarily from hunting and collecting, although some of them also keep goats.

The Bantu, finally, although historically the most recent native people settling in South Africa, are now spread over the whole country

FX13 Hottentot FX13
Bushmen FX10

Environment and Culture

The possibilities of exploitation this region offers to people lacking the highly-developed technical equipment of modern European civilization vary considerably. The ways in which the Bushmen and Hottentots utilize the natural resources of their surroundings will be discussed in some detail in later chapters. Here a rapid survey may be made of the factors conditioning the distribution and mode of life generally of the natives inhabiting the country.[1]

H B 105

The most important consideration naturally is water. Animal and plant life are there in sufficient quantity to support human existence, provided a supply of water is near. Man in his primitive condition is dependent entirely on surface water for the satisfaction of his needs, for he has not the means now possessed by civilized man for getting at the water in the depths below. The amount of surface water therefore determines the density of population in any one area, and the water available in a given area, together with the density of the vegetation, determines the number and size of the settlements in that area.

H B 105 311 312

The character of the country, moreover, limits at once the types of culture that can become indigenous there. South Africa even under modern conditions can only carry on agriculture in certain parts, and most of the country could never support a primitive population of pure agriculturists. It is only in the well-watered districts to the north and east and along the south coast that native agriculture has been developed to any extent. On the other hand, there is an abundant fauna and a sufficiency of vegetable life to afford good subsistence to men. The type of culture then that we would *a priori* expect to find here would be one based largely on hunting and collecting. This is exactly what we do find. The abundance of game formerly existing in South Africa makes it readily comprehensible that hunting at one time played a great role in all parts of the country, and therefore that hunting peoples were distributed all over its surface. All the native peoples of South Africa, whatever other means of subsistence they have, rely to some extent at least for food on the products of the chase and on the edible bulbs and roots of the veld.

H B 105 311

A country, however, which can support great numbers of buck

[1] For special discussions of the South African environment in relation to man, cf. Passarge, op. cit., pp. 162–75; *idem*, "Die Grundlinien im ethnographischen Bilde der Kalahari-Region," *Z. Ges. Erdk. Berlin*, 1905, pp. 20–36, 68–88; (Mrs.) A. W. Hoernlé, "South-West Africa as a Primitive Culture Area," *S. Afr. Geog. J.*, vi (1923), pp. 14–28.

2: Schapera E-4, 5 (no date) 1930
FX13 Hottentot FX13
Bushmen FX10

H
B
105
311

and other grass and herb-eating animals will also support other species of these animals, provided that conditions such as the absence of the tsetse fly and other pests are favourable. Hence we also find pastoral tribes, who have come in from other regions bringing with them great herds of cattle and immense flocks of sheep and goats. One important point must, however, be noticed. Country which, under modern farming conditions, will only carry a small herd of cattle, sheep, and goats, used formerly to carry large herds of well-fed antelopes and zebras. The explanation is that each wild species is specially adapted to living on certain bushes or plants, and that many natural foodstuffs useless to farm stock were made use of by one species or another of wild game. It must also be remembered that the wild game was not restricted by farm boundaries; it was free to shift its ground according to the seasons and the supplies of food and water. For the same reasons a nomadic life was imposed on the native tribes keeping domestic animals, although nowadays with the extension of the European settlements the areas over which free movement is possible have become greatly restricted.

H
B
105
311
312

Viewed in this light, the natural regions of South Africa which have been described above are seen to differ widely in their value for culture. Certain parts of the country, such as the Namib desert strip and the interior of Bushmanland, are largely uninhabitable. The rainfall in both is exceedingly slight, and there is practically no surface water all the year round. In parts of the Namib, however, the river-courses from the mountains of the South-West African plateau periodically carry water, which is dammed up in a few places by rocky outcrops in the river beds, and above all there is the *!naras* melon, whose fruit is sufficiently succulent to provide a substitute for water. Agriculture is completely out of the question. The thin scattered population which the region can support is forced to lead a nomadic hunting life, although in the east, towards the borders of the plateau, the grass which flourishes during the rainy season occasionally permits of pastoralism.

The greater part of the Middle and Southern Kalahari lacks surface water during the dry season only. The water supply at other times is generally sufficient to permit of temporary settlements, although the porous sand covering of the surface absorbs all the rainfall, so that except in the pans and other waterholes the standing water rapidly disappears. The region is sparsely inhabited, and mostly by nomadic peoples. Agriculture is again impossible, save in a few tracts to the

2: Schapera E-4, 5 (no date) 1930
FX13 Hottentot FX13
Bushmen FX10

H
B
105
312
311

east, where the soil is more favourable, but the rainfall is too uncertain to enable grain to be grown with a reasonable prospect of success. The abundance of grass in many parts, especially during the rainy season, affords good pasture to cattle, but the region is above all an excellent hunting ground, and formerly at least it was extraordinarily rich in game. Hence its inhabitants are in the first place hunting peoples, and their life is conditioned by the movements of the game. At the beginning of the rainy season the animals wander out of the permanently-watered regions encircling the desert into its sandy plains, where water is found only in pans, pools, and waterholes. The hunters follow them. As the dry season sets in and the water in the pans begins to shrink, part of the game returns to the watered regions, part of it, however, continues to live in the plains on the *tsama* melons and other succulent plants—and the hunters do the same.

In the well-watered Northern Kalahari three great streams, the Okavango, Kwando, and Zambesi, overflow on to the flat land, in some parts continuously, in others periodically, and thus give rise to an extensive region of swamps. This marshy region is excellent hunting and fishing ground. Its population, more numerous and densely settled than in the rest of the Kalahari, is therefore primarily concerned with these two pursuits. The natives indeed are actually forced to resort in part to fishing, since for motives of security they live mainly on the small islands between the swamps and the rivers. The periodic rise of the rivers annually floods wide stretches of the country, resulting in displacements and wanderings of the game. Consequently, the natives also must roam, partly because their habitations are flooded out, partly because they must follow the animals. Both agriculture and pastoralism are also carried out in parts of the country. The cattle pasture in the sandveld away from the swamps, while the marshy region can only be used for the cultivation of crops, since for wide stretches it is infested by the tsetse.

The upland regions encircling the Kalahari basin on the south-east, south, and west, have for the most part a scanty rainfall. The permanent settlement of this belt during the dry season is therefore restricted to the scattered waterholes, which occur in river beds, on mountain slopes or in depressions on the hard soil. Waterless stretches from 40 to 100 miles in extent are no rarity, so that the settlements are frequently distributed far apart over the land. Here, as in other regions of South Africa, hunting must depend on the movements of

2: Schapera E-4, 5 (no date) 1930
FX13 Hottentot FX13
Bushmen FX 10

H
B
105
311
312

the game. In the more arid parts the animals in the dry season concentrate in vast numbers about the rivers and waterholes and pans, to disperse widely as soon as the rains make life possible elsewhere. The same features of alternate concentration and dispersal can be observed in the life of the purely hunting tribes. The pastoral resources are on the whole excellent, there being no lack of grass or edible shrubs even during the dry season, and consequently cattle-keeping peoples are able to lead a favoured existence in these uplands. Agriculture is also practised to some extent, but is confined to the scattered alluvial tracts. As a means of subsistence it is rendered precarious by the frequent droughts which characterize the region. These often exercise a harmful effect on pastoralism as well, partly because of the ensuing lack of water, but mainly because the pasture is completely destroyed in many parts of the country. The plateaus of the Orange Free State, Cape Province, and Southern Bechuanaland are especially exposed to such catastrophes, but they are often enough marked in South-West Africa also, particularly in Great Namaqualand.

Further east and along the south coast the rainfall is high enough to place cultivation on a safe footing, while the country, where it is not covered with bush or forest, is composed of extensive grass flats which can be used as pasture land. Consequently, both agriculture and pastoralism are equally developed, the former being carried out on a far greater scale than in other parts of South Africa. Here, therefore, we find the most thickly settled zones, and the population is mainly sedentary, even although the pastoral tribes must still to some extent lead a nomadic life.

Migration Routes

H
B
131
167

The geographical situation of South Africa has an obvious bearing upon the racial history of the country. Cut off by vast uninterrupted stretches of water from ready access on the west, south, and east, its most direct link with other regions is overland to the north. In the north-west the great forest regions of the Congo impose an effective barrier upon extensive human migrations, so that it is principally from the north-east that invading peoples have been able to enter the country.[1] The East African highlands are connected with the south by a favourable route passing between the escarpments in the east with their sharp descent to the fertile but fever-stricken coastlands,

[1] Cf. Passarge, *Z. Ges. Erdk. Berlin*, 1905, pp. 32–3; *idem*, *Südafrika*, pp. 163–7.

2: Schapera E-4, 5 (no date) 1930
FX13 Hottentot FX13
Bushmen FX10

Hottentots. The nature of the relationship between these two peoples has given rise to much discussion. They are unquestionably allied in race, and, indeed, in appearance and bodily characters resemble each other so closely as to have often been confused. There are certain features, such as stature and the shape of the head, in which the Hottentots are actually found to differ somewhat from the Cape Bushmen, but differences of the same nature exist even between the Northern Bushmen and those of the Cape. B H 144

The two peoples also have much in common in language. Their speech has the same phonetic basis, characterized especially by the occurrence of several "click" consonants; many roots in the Hottentot languages are found with the same meanings in various Bushman languages; while in grammatical processes and categories there is also a fundamental correspondence, more particularly between the Hottentot and the Central Bushman languages. At the same time, the Hottentot languages have certain grammatical features, such as sex-gender, sex-denoting particles and a dual number, which do not occur in any of the Bushman languages save that of the Naron. B H 193 194 197

In culture the differences are more readily apparent. While the Bushmen are hunters and collectors only, the Hottentots in addition are a pastoral people, with herds of long-horned straight-backed cattle and flocks of fat-tailed hairy sheep. They were also able to smelt metal ores for the manufacture of their implements, weapons, and ornaments, while the Bushmen have never learned to do so and still obtain whatever iron they use by barter from their more advanced neighbours. The Hottentots, again, do not appear ever to have possessed the art of painting and engraving on rock, so remarkable a feature in the culture of the Southern Bushmen; but, then, it should be noted, there is no direct evidence either that the Northern Bushmen were acquainted with this art. In social organization, habits, and customs there are likewise many far-reaching differences, but at the same time, as we shall see, the similarities in some respects are by no means insignificant. In religion, on the other hand, the similarities are occasionally very striking, although here again there are also important differences of detail. B H 105

All these points, both of resemblance and of difference, will be analysed below and discussed more in detail. It must here be mentioned, however, that the common elements indicated are on the whole significant enough to warrant the conclusion that the Hottentots are basically of the same racial stock as the Bushmen, and B H 144 174

Translated from the German for the Human Relations Area Files by Richard Neuse.

/This account presents information on the physical characteristics of the Heikum Bushmen and offers additional materials on the culture of both Heikum and Kung groups. The cultural characteristics discussed include dance and music, diet, clothing, ornaments and amulets, utensils, weapons, tools and houses. In addition there is a 10 page vocabulary list which compares Heikum, Kung and Nama terms and also offers some information on grammar. The author did field work in the area. --Analyst]

/This work is essentially a botanical report of the flora of the Kalahari region. It is related to Bushmen culture only in so far as the author limits the specimens described to those used by the Bushmen and gives very brief, sometimes incidental, information on the cultural use of the plants. The descriptions with the photographs give as complete as possible a basis for identifying the plants, but the cultural information is scanty. The particular group of Bushmen associated with the use of any plant is indicated by the author when known; often the use is general. Plants or their parts which are referred to as "edible" must be presumed to be so

7: Story, R.

by the Bushmen, although in some cases it is apparent the author is referring to the possibility rather than the actuality of usage. Native terms for the plants are presented in every case but marked only for category 137, Flora. --Analyst/

/The author of this account of the Bushmen was the Medical Officer for South West Africa ca. 1920. In this article he gives a general account of Bushmen culture dealing with their origins, the location and population of different tribes, the band organization, some details on settlements, houses, etc. There is also material on marriage, childbirth, economic activities, dancing and games, and magico-religious beliefs and practices of the Bushmen. While the article is short and therefore limited in the amount of detail given, it is a good general account. -- Analyst/

/This source is a popular account of an expedition to the Kalahari Desert in 1955. It concentrates on the life of two groups of Bushmen, the Gikwe and the Kung. The author gives a general description of the culture of these slightly differing groups, the Gikwe living in a more arid environment than the Kung, concentrating on the food quest which is the main interest of these marginal people. The book concentrates on the personal relationships between the author and the various members of the families and bands, singling out individuals for fairly detailed description. In this way, the reader gets a good idea of the normal daily round of the people, although little detail is given about various aspects of the culture, particularly in the areas of social organization and material culture. For such detailed studies, the researcher should see other sources in this file, such as 1: Marshall and 5: Marshall. --Analyst/

Yale: Nkd 74 B228 v.1-2

/This source consists of two articles, the first dealing with kinship terminology, the second with the phonetics and orthography of the Bushmen language. In the kinship article the author gives the terms used by Southern or Cape Colony Bushmen, Northern or Auen and Kung groups, and Central or Naron Bushmen. In addition he discusses the derivation of some of the terms and offers a few brief statements on grammar. The second article offers some critical comments on the orthography suggested by Doke. The author states his preference for older writers' transcriptions of clicks which the author follows in his own kinship charts. The article is based on field work undertaken with the Bushmen. --Analyst/

[This summary article on the !Kung Bushmen was written by a cultural anthropologist especially for this volume. The authenticity of her descriptions derives from a decade of field research experience among the Bushmen. Due to its recency and comprehensiveness the reader should examine this source prior to consulting other specific material in the Bushmen file. The author's theoretical outlook is ecological--using data on Bushmen environmental adaptations, resource potentials of their habitats, population-settlement sizes and distributions in order to develop some functional generalizations about the relations between Bushmen subsistence economy and the nature of their sociopolitical institutions, implying that the level of productivity sets limits to the sociocultural forms that arise. Stress is put on the significance of kinship reciprocity and its relations to foodgathering and seasonal movements, extensive regional kinship bonds, and the egalitarian political structure. Her ethnographic description is excellent, especially her notations on the religious-ritual complex, life cycle and socialization, the kinship basis of headmanship and group leadership, and material culture and technology. Also found are brief interpretations of Bushmen historical origins and affinities, the kinship correlates of the naming relationship in uniting the bands,

15: Marshall, Lorna.

the family cycle, and the effects of acculturation. The introductory comments on pp. 241-242 were written by the editor, James L. Gibbs, Jr. Footnotes at the end of the article may be found in category 116, pp. 273-276. The footnotes have been marked for the categories to which they specifically pertain.]

[The data presented in this thesis are based primarily on the author's field work in the Dobe area of Bechuanaland. On the basis of detailed observations made during a two years stay among these Bushmen, he came to the conclusion that Bushmen economy is far above the starvation level. Except for a relatively short time of the year when the water supply is low, Bushmen are able to gain sufficient food from their environment without strenuous efforts. Gathering of plants, especially a certain kind of nut, is of main importance for food provision. Hunting is of very secondary importance. The author also presents valuable demographic data and gives short descriptions of relations between Bushmen, Bantu and White farmers.]

101 Bushman language groups, Auen, Naron or /Kõ, to the south, or with other /Kung
582 whom the Nyae Nyae /Kung know to be living to the north-east and north-west of them.

619 The S.W.A. and B.P. governments administer the region as it lies within the
[648] territory of each but not as a unit in itself. The /Kung have developed no internal political organization to unite their bands. The unity of the region exists, in so far as we know, only in the minds of its /Kung population and in the fact of their intermarrying and being held together in a net of kinship and affinity.

648 About 1,000 /Kung live in the region. Roughly three-quarters of them live in 28
162 bands and are nomadic hunters and gatherers with no agriculture, herds, or beasts of
[621] burden. Approximately another fourth work for Chwana and Herero on their cattle posts on the periphery of the region. Most of these still have connexions with the interior bands and intermarry among them. In the interior there are no inhabitants
[177] other than /Kung, and no European or Bantu institutions modify the old /Kung way of life.

621 My study of /Kung marriage regulations is based on data derived during the
[114] years 1952–3 specifically from 14 bands with which we had the most contact and on which we gathered considerable genealogical material. These bands varied in size from 8 to 57 persons, averaging 25, with a total of 353. The marriage status of these persons as of 1952–3 is given in Fig. 1.

[162] FIG. 1. *The Marriage status of a sample of 353 persons*

Unmarried girls, adolescent and younger	58
Total	353

601 /Kung social organization is of the 'Eskimo' type, as defined by Murdock.[1]
[595] Theirs is the sub-type, which varies from normal Eskimo in that polygyny occurs and
[596] extended families are common instead of independent nuclear families in neolocal
[611] residence. Other characteristics are normal Eskimo. Descent is reckoned bilaterally,
[614] There are no exogamous unilinear kin groups. There is bilateral extension of the incest taboo. Cousin terms[2] are the same for cross and parallel cousins and cousins
[835] are differentiated terminologically from siblings. One term is applied to both FaBr and MoBr, another to both FaSi and MoSi, and these terms differ from the terms for parents.

621 As we examine their rules of exogamy we find that the band is not an exogamous
582 unit as such. Actually most members of the band are so interrelated by consanguinity or affinity that the marriage regulations strictly prohibit their intermarrying,

Kung

585 then come with us when we leave tomorrow to gather *tsi*. He will hunt from that
[159] place and get us some meat.'
[183] The ritual elements in the wedding ceremony, in so far as we observed, were as follows: (1) carrying the bride so that her feet do not touch the ground; (2) covering her head so that the sun does not shine upon it; (3) waiting till the sun has set before taking her to the wedding scherm; (4) the fact that the scherm is specially built and set apart from the others; (5) anointing with fat; (6) painting a design on the forehead and cheeks with powdered red stone; (7) lighting the wedding fire with brands from the fires of the bride's and groom's parents.

585 Apart from the third and seventh, all these elements occur also in the Ceremony of
881 the First Menstruation, a more elaborate and prolonged ceremony from which the
[174] /Kung wedding ceremony undoubtedly derives. The design on the face is the same; the girl's feet must not touch the ground from the instant her first menstruation begins to the end of the period, when she is washed and anointed with both eland or other fat and the oil of the *tsi* (*Bauhinia esculenta* Burch).[1] When the girl is taken to her special scherm or moved out of it to urinate or defecate she is carried on the back of a kinswoman. A kaross over her head shields her from the sun whether she is sitting in the scherm or being carried out.

Our endeavour to bring to light the meaning of the ritual elements yielded little. The meaning or origin of the design on the face, I was convinced, was not withheld but lost to memory, lore or myth. 'It is our custom' was all the people could tell me.

About the ritual of the feet not touching the ground, the custom frequently
[171] observed by divine kings and menstruating girls, the /Kung had no more illumination. They think that the carrying is the overcoming of the girl's symbolized modesty about going to the arms of her bridegroom, which she should properly feign even if she is eager to go, and her reluctance to separate from her own family: I think that when the attendants take hold of the bride and groom by the arm and pull them a little they symbolize the overcoming of reluctance and modesty and perhaps there is even a vestige of bride capture in that gesture, but of the feet not touching the ground the meaning is lost. Obviously, however, in this society the bride is equated to the
[174] menstruating girl. In the past the girl's wedding and her first menstruation may have been celebrated at one time.

The /Kung say that the sun is death-giving. When the three months of life-
585 giving rains are past, the sun dries up the water pools. It kills the fresh leaves and
821 fruits, dries the roots and berries, and would scorch the people if they did not find shade and dig shallow pits and lie in them covered lightly with sand which they have moistened with their urine for coolness. They pity the morning star, the *kuli |gaishay*, which crosses the sky all day ahead of the sun, has no branches to carry for shade and
593 cannot turn aside to rest under a tree. The sun is a 'death thing' and the bride
585 is shielded from it.
602 The most important element of behaviour with respect to kinship in the wedding

Kung

logical father, as well as his mother's husband, should do something nice for him. 159
Perhaps when he receives his first assegai his begetter will give it, for that is a very 848
proud thing—but we do not know what the future holds for these people or where they will be by then.

The dominance of men

Wives are much desired by the young men, who usually wait for years for their 562
infant fiancées to grow up, and by men who want second wives, and by widowers. [581]
/Kung women are not only precious as mates, they are the food-gatherers and supply [222]
more of the daily food than the men do. Hunting[1] is very arduous in the Kalahari and [462]
the hunters succeed in bringing a big meat animal to the werf only about once or [224]
twice a month. Meanwhile women have dug roots and gathered berries and the other wild plant foods to feed their families every day. /Kung women in their two roles make a very great contribution.

In /Kung society, however, the magnitude of their contribution does not make women dominant. There are factors which bring the men forward clearly into dominance and leadership.

The primary factor is undoubtedly strength. /Kung men are small and slender, [142]
but they are wiry and vigorous. With their strength they carry and protect the very 147
life of their people. When they swing their weapons and implements and their small children on to their shoulders and stride out in front of the women, the image seems to reveal, as vividly as if a great artist had painted it, how the laden following women are borne up by the strength of their men and take heart from them.

Another factor which brings men clearly forward is the character of hunting and 462
its reward. Women bring the daily food, but there is only drudgery in digging and 562
picking in the hot sun and trudging back in the early evening to the werf with heavy [222]
roots and berries and babies all sagging in the pouches of their karosses, a small dead tree or two on one shoulder for the night fire, possibly another child astride the other shoulder. Many of the vegetable foods, furthermore, are rather tasteless and harsh [262]
and are not very satisfying. There is nothing splendid about returning with vegetables and wood. The return of the hunters is vastly different. The intense craving [262]
for meat, the anxiety that goes with the hunt, the deep excitement of the kill, finally [224]
the eating and the satisfaction reach to the very core of the people, engaging powerful emotions. Once, when an eland had been killed and the hunters were sighted [152]
with the meat on their backs, moving in a dark, lumpy, bobbing line in the golden grass, we heard the sound of voices in the werf rising in volume and pitch like the hum of excited bees. Some people ran toward the hunters, others crowded together at the edge of the werf, some danced up and down, the children squealed and ran about, the boys grappled and tussled together. The motion and sound had the effect of a vibration. Another time a young man who was said to be the best hunter in the region (/Qui Hunter we called him, his people called him Short /Qui), had been 462
charged by a magnificent cock ostrich on a big open pan where there was no refuge. 562
He knelt facing the creature till it was within close range and shot an arrow straight 224

[1] John Marshall has described /Kung hunting in his film, *The Hunters*, Peabody Museum Film Study Center, Harvard University, and in 'Man as Hunter', *Natural History*, the magazine of the American Museum of Natural History, New York, vol. lxvii, No. 6, June, and No. 7, August, 1958. [113]

[5 cont.]

173 the Oldoway race as one of its carriers, the presence of a Eurafrican racial element from oldest times on may be regarded as certain also for South Africa. The carriers of this hand-ax industry, who, I am convinced, already carried on a kind of plant cultivation and were tied essentially to the forested zones, were later followed by a group of peoples and races with definite flake industries. Among these we may include the Katanga race and the other Australiform finds. A new wave of Eurafrican racial elements was brought by the carriers of the blade industries of the
174 Middle Stone Age of South Africa. Even today we are still unable to determine when the Bushman races adopted a Stone Age industry or even when they entered the country. Just as racially
[144] the Bushman incorporated remnants of all the preceding races or
[184] those that at one time existed side by side with them (Europoid -- Australiform), so their culture, varying from tribe to tribe, likewise constitutes a unity only in its optimal adaptation to the conditions of the environment. In its individual traits, on the other hand, it represents a residual culture whose stability depends on a selection intentionally and purposively carried out, and which resulted from foreign cultures from the Old Stone Age up to the present.

Chapter 1

The Bushmen of Angola

105 We are indebted to D. F. Bleek (1) for most of the data

[113] 1. D. F. Bleek, "Bushmen of Central Angola," Bantu Studies, Vol. III, No. 2, 1928 Johannesburg. Further, Archiv für Anthropologie, 1930.

concerning the Angola Bushmen. The Bushmen are !Kung. The men are 159.3 (145.5-170) centimeters tall, the women 148.8 (135-161.3) centimeters. They live between the Msuma in the north, the Lomba in the south, and between Okawango and the

[16 cont.]

[131] the one hand, to the Okovanggo and the regions inhabited by the Bamangwato [Ngwato] west of Ngami Lake on the other hand, are inhabited by the tribes of the !Kung group.

Seiner (2) supplies the following apt division of this zone:

[113] 2. Mitteilungen aus Deutschen Schutzgebieten, 1914.

"The !Kung Veld forms the part of the Omaheke belonging to the northern Kalahari and is located between the Okovanggo (from Kagere to 19° southern latitude), the Kaukau Veld, the Sand Veld, the Karst Veld, the Etosha Pan, and the Otjimpolo Veld. -- The Kaukau Veld (according to Passarge, a plateau) is located between the Kung Veld, the Okovanggo, the Okovanggo basin, and the Sand Veld district. As the western boundary, in other words, toward the Sand Veld, the line Bogara -- Debra -- Blue Bush Pan in the western tip of the Okovanggo basin, close to the German border, should be adopted. The northern Sand Veld, through which I have traveled, can be delimited on the west by the line Nuragas -- Otjituo and by the valley of the Omatako from Otjituo to Okahitua; on the south by the line Okahitua -- Okosondusu -- Otjosonjou -- Epata -- Epukiro -- Rietfontein-East; on the east by the border zone of the Chanse Veld, the Okovanggo basin, and the Kaukau Veld. For the
[137] northern boundary toward the Kung Veld, the factors of climate and plant geography must be taken into consideration, since there is no natural boundary here; the line Bogara -- Kanovlei -- Nuragas approximately forms the northern boundary of the Kalahari bush of the central Kalahari, which is sharply differentiated from the dry forest of the northern Kalahari. -- The loose,
[134] deep, leached steppe sand bears for the most part a tall, light xerophytic dry forest, usually with no underbrush and with deciduous trees that, as a result of the quantities of water stored in their root stalks and trunks, bear green leaves during the greater part of the dry season, and in part even bear blossoms and fruit during this season; this dry forest is a formation of relatively recent date. The vegetation of the firm, gray-humus,
[134] loamy river sand, or of the looser sand with ample ground

[17 cont.]

144 obvious, and the southern Bushman race, that is, the one that displays the characteristics generally ascribed to the Bushmen as a whole, is found to be pure only to a modest degree which in-
137 creases toward the south. In the north, the !Kung Bushmen are
184 decidedly forest people, whereas in the Sand Veld they inhabit the shadeless low bush. The surface of the region consists of
134 areas of whitish sand, red toward the east and north, which is
137 streaked with strips of surface chalk. Along the Omuramba Omatako and parallel to it there are pseudo-dunes running north-northeast -- south-southwest and covered with dense thorn bushes. On the more clayey soils in the vicinity of the Omurambas [perhaps a local term for "rivers"] there is denser tropical dry forest. A reminder of more humid times is provided by three or four giant baobab trees that are dying.

Ludwig Zukowsky (1) reports on the fauna and flora:

[113]

1. "Beitrag zur Kenntnis der Säugetiere Deutschsüdwestafrikas [Contribution to the Knowledge of the Mammals of German Southwest Africa], " Archiv für Naturgeschichte, Vol. 90, No. 1, Part A, 1924.

137 "The Kung Veldt, a large deciduous broad-leaf forest
[136] region, bounded in the north by the Okovanggo, in the east by this river's flood area, in the south by the Dusche and Schadum, and in the west by the lower course of the Omuramba u'Omatako, is regarded by J.H. Wilhelm as a special faunal region, since here the most striking representatives of the Sand Veld, oryx, oribi, bubalis, guevei [blue duiker], and canis are absent and in their place new forms appear, such as damaliscus, schaeffia [?], and hippotragus. Red sand dominates the entire region, which is covered with sereng [Burkea africana], red bean trees [Copaifera coleosperma], mokussi (Baikiaca plurijuga), yellowwood [Terminalia sericea], dolf [Therocarpus erinaceus], and wild orange trees (Strychnos schumanniana). During the rainy season, when the trees are covered with leaves, the deciduous forest that covers the entire region remotely resembles a younger German beech forest. The chief tree is the sereng (Burkea africana) with its accompanying tree, the mokussi

/19 cont./

162 In the age group of five to ten years, the number re-
165 mains the same.

The mortality rate is therefore very low, as among us, in fact, even lower, since the dangerous infectious diseases of childhood are absent. Insofar as the few figures given here permit one to draw conclusions, the sex ratio is 1:1. It is impossible to say what the sex ratio is among the adults. A great number
[123] of the men disappeared when I arrived -- since most of them had a bad conscience and did not want to be pinned down either metrically or photographically. It is certainly clear, however, that the higher the age group, the greater is the excess of women.

/20/ Concerning the gray-haired individuals of an advanced age, in other words, over 60 years old, I counted four men and 13 women in the case of the four hordes mentioned above, in other words, a ratio of 1:3. As is the case among us, there, too, the women on the average reach a higher age.

161 C. v. François (1) on his journey to the Okovanggo in

[113]

1. Mitteilungen aus den deutschen Schutzgebieten, IV, 1891.

1891 estimated the population of the region at 500 Honigkaffir and Hei//om, 2,000 !Kung and 10,000 Okawango. The Bushman
[131] tribe of the Wasseckeri was supposed to live north of the Okovanggo, between the Kuando and Cuito. He calls the chief
133 of the northern !Kung the person best acquainted with the land, and this chief assured him that the water conditions had been much better in earlier times. Many of the vleis that are now dry formerly had water the year round. The Okaluombe (Apato) is supposed to have formerly flowed into the Ngami.

Theodor Leutwein (2) reports:

[113]

2. Elf Jahre Gouverneur in Deutsch-Südwestafrika /Eleven Years as Governor in German Southwest Africa/, Berlin, 1906.

648 "North of Grootfontein at Gaub, a place with ample
621 water, a number of Kaffir and Bushmen had formed a village and
622

[23 cont.]

105 and in the beyond by his traditional conceptions, and the preserva-
182 tion of this adaptation, in the spiritual as well as in the material realm, is achieved by means of a strict selection of all the cultural goods offered from the outside. This selection is consciously carried out. Put briefly: the Bushmen have hitherto refused higher
[177] economic forms not because they do not possess the ability to handle them, but because they did not want to adopt them. If the material preconditions collapse, then they adopt, step by step or all at once, totally different ways of life, as is shown by their Bantuization in Ovamboland and probably also by the formation of the Hottentot people through the adoption of livestock raising on the part of a number of Bushman tribes. Their average intelli-
[153] gence is no less than that of any other race. Every Bushman knows
[184] the entire spiritual heritage of his tribe.

Of the same Bushmen, F. Schinz (2) says:

[113] 2. F. Schinz, Deutsch-Südwestafrika, Leipzig, 1891.

181 "The Bushman is always faithful to his master and will follow him anywhere without pay; one need not worry about leaving him alone at the wagon and will rarely have to reprimand him for dishonesty. All travelers and hunters unanimously praise
[593] the great affection that exists between parents and children, which goes so far that the father or mother will sacrifice themselves in order to save their child. I was told [24] by the hunter L. that at the Okovanggo he once witnessed a scene in which a young Bushman, who was one of the members of the hunting expedition, was in danger of being trampled to death by an angry elephant that stormed toward him. At the last moment when his paralyzed companions had already given the boy up for lost, his father sprang forth and flung his throwing club at the forehead of the enormous animal. The elephant now turned against his new attacher and furiously crushed him under his feet, giving the son the opportunity to flee."

[114] My observations are fully in accord with those of Dornan (1)

[113] 1. Dornan, Pygmies and Bushmen of the Kalahari, London, 1925.

[24 cont.]

000 they had never seen any. A certain dry humor spiced their con-
522 versation. I once said to a Bushman: "If you tell me this, you
161 will get whatever you want." He answered: "Good, I shall speak
157 and you will give me your automobile." Their imagination is
123 very poor; in this respect they are much too accurate as observers of nature. Once a young Bushman woman with two children came to me and wanted to buy some sugar. I said to her: "I won't sell you anything, but you will get the sugar if you tell me some children's stories, for example, about animals." After some hesi-
[538] tation she began the story of Arri, the guinea hen. It was no fairy tale, but a detailed account concerning this important food bird. She even imitated the calls of the guinea hen, "for example, when someone comes and there is danger, then they say, 'gannana he gannana he,' but when they are alone and enjoying themselves, then they go 'gi gi gi.'" The children had to imi-
[861] tate this until they were able to mimic the sound accurately. Then it was the turn of the sand hen, which says, "gi ganna gi ganna"; then the ostrich, which goes, "hmm, hmm, hmm"; then the gum bird [Harzvogel], which says, "hai-dschi, hai-dschi," and the owl, "mhm, m."

3. Posture, Movement, Stamina

516 As a result of his marked lordosis, the Bushman never assumes a posture that would conform to our military ideal; he almost always stands with his stomach somewhat protruding.

481 The way the Bushmen run is very peculiar and would justify detailed study. [25] The run is really a continuous fast walk, in which the legs are kicked forward, but the lower thighs are never brought back high, as is the case with our runners. The body is held as straight as possible, and the head up, not forward (1).

[113] 1. E. v. Eickstedt (Rassenkunde und Rassengeschichte der Menschheit [Ethnology and History of Mankind], p. 556) states: "The foot is put in a peculiar transverse position, which makes the track in the sand easily

[27 cont.]

221 Bushmen shrink to miserable skeletons. Many of them at this
[648] time! run to the Blacks or Whites in order to earn something. In
[731] dry years no attention is paid to the kin group boundaries. All
[423] gather around the few water holes that are still open. As soon as the rain begins, conditions start to improve; the people start moving out in various directions, not to meet again until several months later at the time of the veldkost harvest here and there.

7. The Course of Life

584 I shall render in literal translation the account that my informant gave of the way a young man courts a girl:

If a young man wants to marry a girl, he must first speak to her and say: "I love you and want to marry you." If the girl is willing, she says first: "You must wait." Then she goes to her parents and asks them whether they have heard that the boy has spoken to her. The parents then ask whether the girl wants to marry the man. [28] If the girl says, "Yes," then the parents say, "He wants you; he has seen that you are good and hard-working; you may marry." If, however, the young man has thought the matter over and takes back his words, the girl goes to her parents once more, and the boy to his. The latter say: "You wanted it this way; nothing can be done about it." In case the girl definitely gives her consent, however, the young man brings all kinds of little presents and gives them to his future bride, who takes them to her parents. The parents-in-law must now in turn give presents. With the exchange of presents, the
[583] marriage is regarded as legally concluded.

[114] 224 584 [113] The hunting test described by Passarge (1) and others is not

1. Passarge, Die Buschmänner der Kalahari, 1907.

the rule. Some vain girls demand it, and sometimes young men will voluntarily go through with it in order to beat his rivals. This hunting test is carried out in the following manner. The boy goes hunting without weapons and pursues the game (as a rule,

1 [i.e. The hot season -- Analyst]

[28 cont.]

224 a gemsbok) until it is tired and then drives it to the vicinity of
584 the hut of his intended. The pursuit of such a large antelope is not as difficult as it looks, for these ruminants are seized with serious cramps if they are not given time to settle down to ruminate. In other words, the pursuit of such a large antelope simply involves continually disturbing the animal for a long period of time. Then the young man calls to the people and asks them for weapons. All of them leap up, and the girl, too, stands up and watches as her people run with the spears. The hunter kills the game before her eyes. Then they bring the meat and cook it, and the girl says: "That is a courageous hunter; I want to marry
584 him." It is not unusual, however, for a young man to marry far away from his relatives, without having asked for the consent of his parents. In that case, the young woman must stay with her parents while the husband returns home and reports the marriage to his parents. The latter say: "How can you do this, when we don't know whether it will turn out all right?" The husband, however, says: "I have already done it, and I am merely telling you." Thereupon the parents answer: "Well, it's all right."
[591] Then the husband returns to his young wife, or to her kin group and brings his wife and child to his own kin group, where they are received. According to Vedder (Tsumeb), the young man sends a messenger with a piece of game to the father of the girl of his choice. If the father accepts the game, the betrothal is regarded
583 as concluded. As soon as the youth moves to the encampment of
591 his father-in-law, the marriage is regarded as concluded. He
[585] must work for a year for his father-in-law and deliver all hunting spoils to him, but he may not enter the hut of his parents-in-law. Once the first child is born, he moves with wife and child to his kin group.

585 Von Zastrow and Vedder (2) report on the conclusion of a
535

[113] 2. Von Zastrow and Vedder, "Die Buschmänner," p. 417, in Schultze-Ewarth, Das Eingeborenenrecht, Vol. II.

marriage:

"There is much dancing. The animal dances have a pervasive erotic element. In one of the first dances the bridegroom

[29 cont.]

553 The custom of spitting is undoubtedly original, not a substitute
852 for well water."

551 The father gives his newborn child a name. The boys usually receive animal names, commonly that of the [illegible]ndfather, and the girls, plant names. Albinos are unknown among [illegible] !Kung
[142] tribes visited by me, but a horde of Bushmen with red eyes is supposed to live in the eastern Sand Veld in the region of the
[845] Dussidum. I have never seen twins; they are probably done away
853 with. The children are breast fed for a long time; older infants learn to squeeze the milk out of the breast with their fingers or pull with their teeth on the leathery nipples. The assertion of
847 other travelers that the women kill their children if they are born
[114] before the previous child has been weaned is allegedly not true of the kin groups visited by me. On the other hand, Vedder (1)

[113] 1. "Zur Vorgeschichte der eingeborenen Völkerschaften von Südwestafrika. I. Die Buschmänner [On the Prehistory of the Native Tribes of Southwest Africa]," by V. Vedder, Journal of the South West Africa Scientific Society, Vol. I, p. 10, 1925-1926, Windhoek, 1927. -- Cf. also Von Zastrow and H. Vedder, op. cit., p. 414.

reports:

"I must mention one other custom which likewise considerably contributes, and may have contributed in prehistoric times, to the Bushmen being so few in number. Custom demands that a child born when the older child of the same mother is not yet three years old be buried alive. This is a gruesome custom. I spoke about it with a racially pure Bushman. My remonstrances did not convince him at all. He explained: 'We Bushmen are poor people. We have no goats and no cows to give our children milk. If the woman brings two children into the world within a period of three years, we don't know what the older child is supposed to live on if the newborn child uses up the mother's milk. It cannot live on the hard veldkost or on tough meat. The teeth are not yet strong enough. If we let the newborn

[30 cont.] VON ZASTROW
113 and Vedder (1) report further:

1. Von Zastrow and Vedder, Die Buschmänner, pp. 412-413.

843 "It is absolutely against the rules to do anything by word or
754 deed to the pregnant woman that might make her angry. Her evil eye in this period is especially dangerous; her angry word or her curse has an even worse effect. Sores, illness, protracted suffering, and death are the consequences of the evil eye or the curse of a pregnant woman.

844 "It is customary to sever the umbilical cord with an instrument only when the blood no longer pulsates. The umbilical cord is not tied off. The afterbirth must be carefully and secretly buried. The life of the child would be greatly endangered if an animal found it or if a feared sorcerer could appropriate a piece of it."

881 As soon as the girls have their first menstruation (/n) (2),

2. Female genitalia (/n-i).

a celebration takes place, but in this tribe I was unable to learn any of the details. On this occasion, the women dance, clap their hands, and sing, "giriri, giriri, giriri, uhu, giriri uhu," and so forth.

Men may not be present at this celebration. In a Hei//om horde neighboring the !Kung, spirits are appealed to in all directions on the occasion of this celebration, so that the girl, as an adult, will find veldkost everywhere.

The existence of a true initiation for boys is denied (3).

[114] 3. On this point I was either misunderstood
[124] or told a falsehood.

There is merely a kind of testing; an older man goes with the candidate or candidates on a hunting expedition. Under the supervision of the older person, the candidate must kill a specimen of large game. The animal is then brought to the sacred fire, at which the

[34 cont.]

312 Concerning other water-containing trees, F. Seiner re-
624 ports:

"The water-containing trees always have two or more trunks, and the source of the water is to be sought up where the branches fork. If the saddle formed where the branches separate shows a hole, a hollow area is traced in the adjoining part of the trunk, which may contain up to 60 liters of water. The water is obtained by tying, Bushman fashion, a small bundle of dry grass, or better still, a handkerchief, to the tip of a stick and inserting it in the hollow. When the stick is drawn out, the water drips

Fig. 1. !Kung at a Bushman Well.

from the saturated bundle or cloth, which is pressed out over a cup. [Fig. 2 appears here.]

[35] "The most important water roots are the Asclepiadacea Fockea damarana Schltr. (ehoe), the Leguminosa

[532]
[224]

Fig. 2. //Gauab drives the game toward the hunters (from
●[113] Kühn and Obermann, Buschmannkunst [Bushman Art]).

[35 cont.]

312 824 Dolichos seineri Harms (eona), and the Convolvulacea Ipomoea seineri Pilger (eawa); the enormous tubers of the latter two may weigh up to 150 kilograms. Considerably more important for the natives than these 'water roots' is the Curcurbitacea Citrullus naudinianus Hook. (orura of the Herero; gab of the Hottentot); without their juicy gourds, which occur in great quantities and for the most part are edible, most of the central Kalahari would be impassable during the dry season, even for the Bushmen."

Further, F. Galton (1) reports:

● (113) 1. F. Galton, Tropisches Südafrika, p. 101.

312 825 "In practice, the first hopeful sign when people are looking around for water is a flight of guinea fowl; next, following the habits of the land, each tree is carefully examined until a parrot is sighted, an object visible even at a great distance because the bird likes to sit on the uppermost branches. A parrot is rarely more than half an hour away from water, and the same applies to baboons. If one proceeds with careful observation and takes a probable direction, he will see doves flying about; then little birds are found in all the bushes, and they are close to it."

10. The Veldkost

222 776 Just as //Gauab accompanies the hunter on the chase, he is also the companion of the women who go to look for veldkost. If //Gauab takes delight in a woman, he will break the bones of an animal, killing it, and will lead the woman to it. If, however, //Gauab is angry at a woman and she finds no veldkost, then she becomes angry, gets up early in the morning, abuses //Gauab, and then takes medicine and washes her face so that //Gauab will not recognize her. Then she goes into the veld and finds something. [782] //Gauab receives no offerings from the veldkost. The celebration 222 of the first fruits of the veld described by Vedder is no longer held. [887] The oldest woman is brought to eat samples of each type of veldkost that is brought home for the first time in the year. Then the second oldest woman takes a taste, and so on down the line.

[58 cont.]

775 From there they make their rounds. They always return to their
769 graves. Hence, a Bushman always makes a detour around a grave. He does not point at a grave with his finger, and he does not call to a companion: 'There is a grave!' A great detour is made around the area where there is a grave. When a Bushman unexpectedly passes a grave, he puts a stone on it. That is a greeting for the dead person. In so doing, one makes the grave more secure against wild animals."

769 From the region of Foxhof I have the following informa-
775 tion to add:

"The Gauab that arises from the flesh of the corpse remains seated by the grave. When a relative passes by and the Gauab is sitting out in the open, the Gauab thinks: I know this person well; why is he passing by here without giving me any water. Then the Gauab becomes angry and makes him sick. Then when the doctors sing, they recognize what the trouble is and say: Today you passed by the grave of N. and did not give anything. Tomorrow morning very early you must take water and an ostrich egg and place them by the grave. Such a Gauab also
775 goes hunting, kills game, makes a fire, cuts open the game,
787 takes the fat, and brings it to the doctors while they are singing. The Gauab, whom the other people cannot see, sits down at
[756] some distance from the dancers. The doctor sees him, however, and goes to the Gauab. The latter tells him where the game lies, and the doctor tells this to the other people, who fetch the game and praise the Gauab.

775 "The stars are the campfires of the Gauab.

"The Gauana take the souls that they have stolen to their village and then back to the grave. The people often hear a voice in the veld; this is the Gauab calling, and on their way they find a piece of dead game. When the Gauab is out hunting and has gone too far from his grave, he must sleep in a tree. Some of the souls stolen by the Gauab are brought to the captain of the Gauana. The souls that are taken there again become actual persons up above with the captain of the rain. The others, however, are the little Gauab who go hunting here."

[114] The observations made by Bleek (3) 50 years ago seem to
776 be especially significant.

3. W. H. J. Bleek and L.C.Lloyd,

[113]

[58 cont.]

[113] Specimens of Bushmen Folklore, London, 1910-11, pp. 10-13.

776 be especially significant. The !Kung at that time told of a being called /Chue, who transforms itself in turn into various fruit trees and veldkost plants, into a Herero, etc. One day he transformed himself into a //gui tree, his wife ate of it, the tree disappeared, and /Chue changed into a fly. Another time he even became a waterhole, then again a gecko; at night [59] he always changes back into a little human being. The Herero look for him, but cannot find him. /Chue then makes a fire and dies. His father sees this and then moves to his homeland on a large mountain called //Noa. We shall probably not go wrong if we identify this /Chue with Huwe. This Huwe, as is known, is sometimes equated with the great captain X'u. In this old setting he also has distinct traits of Heiseb.

782 The !Kung who were W.H.J. Bleek's informants were also familiar with a prayer song addressed to the new moon. In ac-
[534] companiment, they blew on trumpets made of antelope horns. (Bleek-Lloyd, ibid., p. 15.)

787 The old !Kung called the prophesy sticks /Chu, which evidently is the same name again as that of the great captain and is in agreement with Dornan's report concerning the Masarwa that Modimo himself spoke from the prophesy sticks.

755 Vedder reports that in case of illness a messenger is sent
769 to an ancestor's grave and prays: A dsi-dsi mi !hâ tí /X'ai-a? (Why is my son ill?) ǂnu /kôa (to live in health).

774 While my informants denied the presence of any animistic
825 conceptions, the old !Kung believe that certain snakes, lizards,
775 and antelope found in the vicinity of graves represent spirits of the
171 dead (1), as they do among the Bantu.

1. W.H.J. Bleek and L.C. Lloyd, ibid., p. 430.

Chapter 7

The Bushmen of the North

114 Our best information concerning the Masarwa comes from Dornan (1) and Holub (2). In what follows an outline sketch will

[113] 1. Dornan, Pygrines and Bushmen of the Kalahari, London, 1925.

2. Holub, Die Masarwa.

be given of the culture of this tribe, based upon these two authors.

342 According to Dornan, the Masarwa once preferred to live in caves, where their ancestors had made paintings. The Bushmen in the Wankie and Ngami districts have plaited mats of grass [285] or reed, with which they cover their windscreens. Sometimes they make a kind of roof covered with grass; otherwise they have ordinary windscreens.

[532]
[172]

Fig. 21a. Representation of a Curing Scene. In the background, the female doctor who serves as oracle. (Eastern Cape Province. From J. P. Johnson, The Prehistoric Period in [113] South Africa, 1910.)

322 For the wood of the bow the Masarwa use very straight 411 little tree trunks. After the bark is removed, they are tied to a straight tree and left to dry. The wood is then given its final drying over the fire and is placed in water so that it will not splinter. The middle of the bow is also commonly wound with tendons. The bow is often greased and never unstrung. The finished bow is smoothed with a rough stone.

[62 cont.]

293 Like the prehistoric Bushmen, these people, too, wear forehead bands, into which the arrows are stuck during the hunt.

726 Dornan (p. 139) reports that the Kalahari Bushmen hold
754 dances before the start of a war, and on these occasions they shoot little poisoned arrows from equally small bows in the direction of the enemy or of the sun. They believe that in so doing they are killing the shadow spirit of the enemy. They do not like to give these miniature bows and arrows to anyone because they are afraid that they might come into the possession of their enemies and thus bring about their own deaths.

226 Fishing is still quite well developed among the Masarwa people. Stone walls are sometimes built in the river, in which weir-baskets are set, or they sit in the river bed next to one another with weir-baskets, while women and children drive the fish toward them. In smaller waterholes, grass and brush are piled up on one side. Then the Bushmen step into the water and push the grass wall ahead of them, thus driving the fish into a corner. Individual fish are also speared with the assagai. According to Hodson, the best fishermen are the Bakoba Bushmen on the Okovanggo. They have harpoons and rush nets that are drawn diagonally across the river.

278 G. A. Farini (3) had an opportunity to observe the

• [113] 3. G. A. Farini, Durch die Kalahariwüste [Through the Kalahari Desert], Leipzig, 1886.

manufacture of arrow poison in the Chanse Veld. The men gathered at a certain place; women were not allowed to be present. The sap was removed from about 30 to 40 poisonous bulbs by means
[535] of successive incisions and was collected in a pan. As each incision was made, the Bushmen danced in a circle, making a kind of grunt. Then a hyena hide was spread out with the hair side down, and on it was spread the contents of the bags that contained the dried heads of poisonous snakes, as well as two pieces of reed approximately 15 centimeters long. Then a number of freshly killed poisonous snakes were brought. The poison sacs were removed amidst singing and the clapping of hands. Meanwhile the pan containing the poison had been put on the fire and was boiling;

[63 cont.]

764 [178] termite hills, sometimes in rock fissures, and commonly Betschuana [Tswana] style, in lateral niche graves. Besides food and water, a man's weapons are put in the grave with him, and for a woman, some ostrich eggs.

776 777 Now for the world view of the Masarwa. As Dornan reports, Thora is the very great one who [64] is above all things. He sends the rain and the game, veldkost and hunting luck. They commonly invoke Thora for luck on the hunt and thank him when they have had it (1).

●[113] 1. P. Schebesta, "Die religiösen Anschauungen Südafrikas [The Religious View of South Africa]," Anthropos, XVIII-XIX, 1923-24.

776 [224] [782] Chapman reports that Bushmen who once had killed a rhinoceros sprinkled some dust on the animal's tail and eyes and at the same time murmured words of thanks to Thora.

The Bushmen are not entirely clear as to whether Thora is a spirit or not; in any case they have great respect for him. They believe that Thora makes all things, but they do not know where he lives or whether he is a person. The western tribes primarily use the word Huwe. The Tati, however, also know this word and regard Huwe as a good spirit who keeps away sickness, gives abundant food, and protects the Bushmen in times of danger. They call [782] upon him when in need. The Sansoque say, Huwe ka hume ie ie [539] (Huwe, come and help us). Huwe, however, seems to be weaker than Thora and must turn to him for help. A Bushman song from Thuli goes: Tho-ra ba Hu-we ie ie (Thora, come to the aid of Huwe).

[171] [174] Among many Bushman tribes and also among the Hottentot, an evil principle, "Khauna," is known, a concept that stems from the times when the Bushmen and Hottentot were one people. The [173] Kalahari Bushmen are not certain whether Thora or Khauna made the first human beings.

825 Incidentally, the Kalahari Bushmen believe that men and animals can change their shapes; thus, for example, a person may appear as a leopard. In particular, springboks, baboons, and some snakes are regarded as human beings in another stage of their

MASARWA
OR OVONGGO BUSHMEN

[64 cont.]

600 the beyond one acts the same as on this earth. Like the Namib
769 Bushmen, they throw little stones on the graves and at the same time pray that the spirit of the deceased may bring them luck (Dornan, op. cit., p. 146).

787 Conceptions concerning dreams are tied in with the Lulu
[774] doctrine of conscience. In a dream the other self speaks with the dreamer, and this may be good or bad. The other self may be influenced by enemies and thus do harm to the twin soul.

According to Dornan, the Bantu adopted the oracle sticks from the Bushmen. Every Masarwa carries four or five pieces with him. The female pieces are longer and narrower than the
[825] male pieces. They are made from the hoofs of small mammals,
[824] from wildebeest bones, and fruit kernels. The names of the four sticks are: Chowe, Kao, Daua, Gaichwe. The Masarwa believe
[776] that [65] Thora and Huwe, and perhaps also Khauma, speak through these bones, and Mackenzie (1) states that the Bushmen

[113] 1. Ten Years North of the Orange River, p. 136.

had designated these bones as morimo aa'me (things of God).

The shoulderblade of the springbok is also used for divination by the Masarwa.

606 Among the Masarwa the mother-in-law may not look at
551 her son-in-law and may not mention his name. The wife may say
602 neither the name of her husband nor the names of his relatives.

Finally, concerning the Swamp Bushmen of the Okovonggo
105 delta, J. Seiner reports:
101 "The Tannekwe have summer and winter villages, as well as boats and goats, and engage in agriculture, fishing, and hunting.
[563] The latter occupations are practiced by the pure Bushmen, whereas half-breeds and the pure Mambukuschu, who were stolen as children and reared by the Bushmen, occupy themselves with agriculture and subordinate tasks.

"The number of racially pure Bushmen among the Tannekwe
[144] may be as high as 60 per cent, but as a result of the slight increase of true Bushmen, which they try to equalize by stealing the Mambukuschu children, they are undergoing a steady decrease,
AND RACIAL MIXTURE IS PROGRESSING RAPIDLY,

[65 cont.]

000 and racial mixture is progressing rapidly. The Bugakwe live in
105 five villages with 220 persons in the western Okovanggo Valley
[161] down from the Mahango ford and are in bondage to Libebe, with
101
131 whom, however, they frequently have quarrels over the amount of deliveries; on the occasion of one such dispute in June, 1905, a Mambukuschu was killed by an arrow. The Garikwe live in
[161] eight villages with 430 souls in eastern Ärmellande from the Paliba Swamp to the beginning of the valley, while the Goekwe live in southern Ärmellande west of the river course. Concerning
[161] the latter, I found only a winter village with 90 souls, and that north of the mouth of the Namassere on a river island.

"The Goekwe might well be identical with Passarge's Gokwe, whose territory extends from the western edge of the Tauche swampland deep into the Kaukau Veld; the Tschorilo Mountains belong to them. During the rainy season the Tannekwe undertake hunting expeditions in the neighboring steppes. The Hukwe, whose
[161] number I estimate at at least 600, are less racially mixed than the Tannekwe, but likewise live in settled villages, from which during the dry season they swarm out in family groups to gather or hunt in the forest steppe as the need arises."

Chapter 8

The Nogau Bushmen of Epukiro

101 During my stay in the mission station of Epukiro, I had an opportunity for closer contact with the Bushmen who live in a kind of symbiosis with the Betschuana (2). They call themselves Nogau,

[113] 2. I have given a detailed report on the Europeanized Betschuana village of Epukiro in Zeitschrift für Ethnologie, Vol. 65 (1933).

specifically ≠no /gna !khou, that is, people who live by the water.
101 They are farther north of the Omuramba Epukiro toward Alexeck.
131 North of them are the Gai-kwe, and the !Kung are farther east and

[68 cont.]

142 Racially, these Bushmen are smaller and lighter in color than
144 those of the north and show the admixtures of the southern Bushman race to a much greater degree. There is constant coming and go-
648 ing in this region. Seiner (1) reports the following:

[113]

1. J. Seiner, "Der Verbindungsweg zwischen Deutsch-Südwest-Afrika und der Betschuanalandeisenbahn [The Line of Communication between German Southwest Africa and the Bechuanaland Railway]," Globus, Vol. 96, 1910.

"The Bushmen from around Rietfontein are friendly to the Germans and repeatedly supplied the station garrison with effective help against the Herero and Ovambandjeru passing through. At the time of my stay in January and February, 1907, there was a small village of the Au-nin, who belong to Passarge's Kaukau people, one kilometer north of the barracks, and a village of the Ai-khoe, whom Passarge includes among the Ngami people, one and a half kilometers southwest of the station. The Bushmen of the latter village were subject to the Au-nin, who called them Naru (subordinates, slaves). Since in June, 1908, Dr. Pöch found only Au-nin in Rietfontein, it would seem that the Ai-khoe, in the meantime had emigrated or were driven out by the Au-nin."

To some extent all these tribes represent a cultural unit. A
[184] 114 fine study by First Lieutenant Kaufmann (2) is available for the

[113]

these tribes with one another, and it is to be understood that only the data concerning the Nogau are my own.

[75 cont.]

9. Hunting

224 Even today the western Kalahari has fairly abundant game, and life can be maintained at least to some extent by hunting. Before going to hunt, a tamana fruit (tse) is rubbed on the face. They also try to absorb the powers of the game by means of inoculation. For example, when a duiker has been killed, little pieces of the heart and ear are charred. This animal charcoal is then rubbed into an incision on the upper arm. Both in war and
[202] hunting, people communicate by means of smoke signals. The chief hunting weapon [76] is the bow with the poisoned arrow.
278 The poison (1) is obtained from the cocoons of a beetle larva that

[113]

1. Lewin has devoted several studies to Bushman poisons ("Pfeilgifte der Buschmänner [Arrow Poisons of the Bushmen]," Zeitschrift für Ethnologie, Vol. 44, 1912).

"When I was permitted to examine the first arrows armed with poison that Lichtenstein had brought home from his journey in the year 1806 and which are kept in the Museum for Ethnology here, I was able to establish that there is alkaloid in the poison, which initially had stimulating, and later paralyzing effects on spine and brain. Because of the small quantity of the material, nothing further could be determined, except for a curious color reaction that the alkaloid isolated from the poison produced with concentrated sulphuric acid.

"I have now succeeded in producing from the bulb of Haemanthus toxicarius, the 'poison bulb' of the old Dutch colonists, the most active ingredient, an alkaloid which chemically and toxically

[76 cont.]

278

corresponds to the active ingredient of the poison taken from the arrow. I gave it the name Haemanthin.

"After the subcutaneous injection of animals with the water soluble albumin isolated from Blepharida larvae six to seven milimeters long, disturbances of movement set in fairly rapidly. Food is no longer taken. It makes doves vomit, and, like rabbits, they also get diarrhea. They become quiet, they huddle motionless, and their eyelids, which for a time move almost ceaselessly, finally are affected by the lethargy or inability to move. The eyes are closed. The animals then fall into a sleep-like state and perish, but commonly only after many hours of difficult breathing. Dissection shows changes in the kidney."

A survey of the poisonous plants of South Africa has been supplied by J. M. Watt. In South Africa over five hundred species are used as medicinal plants, and 150 are regarded as dangerous poisonous plants. Most of the poisonous plants known to date have an effect like digitalis. The old arrow-poison plants of the Bushmen, Acokanthera venenata and A. spectabilis, which have been examined in greater detail by Moir, Lewis, and Curson, also belong to this category. It is striking that the poison has an extraordinary chemical and physical stability. For poisoning per os, Boweia volubilis is commonly used by the natives.

278 lives on the roots of an acacia. The Bushman carries several of these cocoons around with him, like cartridges, in an antelope horn. If the arrow tip is to be poisoned, a fire is made, some of the acacia resin that the Bushman always carries is smeared on the arrow tip, and then a cocoon is broken and its contents rubbed on the tip. On one occasion one of my Bushmen had overlooked a small wound on his thumb, through which the poison penetrated into his blood stream. The penetration of the poison was not very painful; he merely had a feeling "as though warm water was penetrating into his flesh." The arm was considerably swollen for a week. The others made numerous incisions and scarifications with glowing sticks on him in order to save him. [752] [262] The flesh of the animal killed in this way is eaten raw, poisonous.

278 Von François (2) reports that the Hei//om of this region

[113] 2. Von François, "Reiseberichte Windhuk-Gobabis [Travel Report, Windhoek-Gobabis]," Mitteilungen aus den deutschen Schutzgebieten, V., 1892.

prepare their poison from the milky sap of the Apocynacea adenium Boehmianum. When exposed to the sun, it first becomes violet and then black. It is kept in little leather sacks and in case of need is warmed and mixed with the sap of the Habas root and applied to the arrow tips with flat sticks. These Bushmen still [411] used grooved stones to direct the arrow shaft.

000 it with the fingers. [Fig. 29 appears here.]

224 [79] The lion is neither eaten nor hunted. The jackal and
262 leopard are eaten, as is the liver of the latter. Baboons are not
825 eaten, because they were formerly Bushmen.

304 The line of tattooing between the eyebrows make people
302 into leopards among the Nogau. The Naron smear themselves with red and black color. The other incisions and tattooing are made purely for adornment.

825 Among the Naron, millepedes are regarded as creatures
756 of Hise, and only doctors may touch them and make medicine of them. Among the Nogau and ǂAuin there are magical bones
787 that are used to predict the future. The Naron also believe that
[172] the rock engravings stem from //gauwa.

Among the Auin it is forbidden to eat hyena flesh, and
262 likewise the flesh of the shabrack jackal because it is a dog.

be added:

"I have repeatedly found Bushman arrows on which the point, usually made of bone (for the most part ostrich bone), was made of wood. The game sling, reproduced in Figure 29, is constructed as follows: A strong string, four to five millimeters thick, which at one end terminates in a simple loop, is fastened at the other end to a flexible young tree or branch that is bent far over. A small, thinner string with a transverse stick is attached at the loop end. The string is placed around a small post driven into the ground at an angle, and it is prevented from slipping off by means of a flat piece of wood buried under the ground and planted against the free end of the transverse stick; the sling is placed in a circle on the ground over the flat piece of wood. The game, which follows its customary track to the

5:Marshall E-5 (1950-1955) 1957 FX10 Bushmen FX10
Kung

test this factor and eventually we learned that there are two aspects to the /Kung system of kin terminology. In one terms are applied according to the biological position of the persons; in the other terms are applied because persons are classified with others by having the same names, in ways this paper will explain. The factor of the name has resulted in kin terms being applied by persons who have no consanguineous or affinal ties, but who are considered to be related through the factor of the name in what we call the name-relationship.

Miss Bleek in her paper on 'Bushman Terms of Relationship'[1] has recorded /Kung terms. Students of the subject interested in comparing her paper with this will find them in agreement to a considerable extent, but Miss Bleek's paper does not go so deeply into the terminology as this does nor does it bring out the significance of the factor of the name.[2]

Our material on /Kung kin terminology is presented in two parts. (I) The first part (A) deals with terms applied to consanguineous kin, and explains the factor of the name and the way the application of terms is extended through the factor of the name to persons who have no consanguineous or affinal ties, in what we call the name-relationship; and (B) deals with terms applied to affines. (II) The second part deals with certain aspects of behaviour related to kin terminology, touching briefly upon marriage prohibitions and preferences from the point of view of terminology. It deals more fully with the joking relationship, an aspect of behaviour which relates closely to terminological categories. The paper finally touches upon the way the name-relationship serves as an amalgamating factor within a whole region among people who have no larger organized social units than autonomous bands, small ones of 10–15 persons up to large ones of 40–60 persons, composed of consanguineous kin and their affines.

Space does not permit here a description of the composition of bands, but we hope in a future publication to give data on the family and bands, on hunting and veldkos territories, marriage, residence, settlement patterns, and on the behaviour among kin in forming hunting and gathering parties, arrow-lending, meat-sharing, gift-giving, &c.

[1] D. F. Bleek, 'Bushman Terms of Relationship', *Bantu Studies*, vol. ii (1923–6), pp. 57–70.

[2] Miss Bleek (ibid.) sometimes gives the descriptive phrase in place of, or in addition to, the term, as if we should say father's brother or mother's brother instead of uncle. For instance, *he sin* is a descriptive phrase meaning father's younger brother or younger sister. There are differences of spelling. We should like to follow Miss Bleek's spelling, but we put down as best we could what we heard and cannot change over to her spelling because in the different areas the Bushmen's pronunciation may possibly have varied slightly. There are some terms given by Miss Bleek which we did not hear in the Nyae Nyae region. The /Kung of Nyae Nyae do not use the term *tsau* for Br. We did not hear *||ge*, nor *soin||ge*, nor *tsa* as a prefix to *sin*. Otherwise the terms we record are recognizable as the same terms which Miss Bleek records. Miss Bleek, on the other hand, does not record all the terms which we record as used in the Nyae Nyae area. The principal difference lies, we think, in her not taking into account the factor of the name. We think she had an inkling of there being such a factor among the /Kung she worked with, for she says they had a word */ku* which she thought meant 'kinsman' or 'namesake'. In any case, she does not show all the terms which in the Nyae Nyae region might be applied to grandparents, grandchildren and collaterals on both the paternal and maternal sides. A detailed comparison of the papers would show several examples, but one will suffice to illustrate the point. Miss Bleek records the terms for FaBr, *tsu*, and MoBr, *tsau||ge*, giving the impression that the /Kung system makes a terminological distinction between the paternal and maternal siblings, whereas we found that in the Nyae Nyae area both terms, *tsu* and *tsau||ge*, might be used for either FaBr or MoBr, and, besides, that the sibling term, elder Br, might also be used for FaBr or MoBr, as will be explained.

PREFACE

The Bushmen of Southern Africa are today represented by scattered groups of hunters on the plains of the Kalahari and on the farms of South West Africa and Angola. They are a unique and mysterious people and have attracted the attention of numerous writers since the early settlers at the Cape first made contact with the Sonquas. In this Bibliography an attempt has been made to list most aspects of the culture of the Bushmen. A bibliography on rock art was compiled in 1947, thus only a few items appear on this subject. Those included are of interest because they suggest some facet of culture or culture history. Some items are predominently of a physical anthropological nature but contain sufficient ethnological information to justify their inclusion.

The items are arranged in alphabetical order under broad subject headings and an Author-Title index has been provided. The section entitled History, was included because it was felt that the earliest references to Bushmen at the Cape and later in the interior, are of interest, in creating a picture of the life and customs of the extinct groups of Bushmen. The history of the tragic clashes between the Bushmen and other races which led to their extinction in most of Southern Africa, is traced in such historical works as J. Sutherland, Memoir respecting the Kaffirs Hottentots and Boshemans of South Africa and Donald Moodie, The Record

The main body of the bibliography is devoted to the ethnology of the Bushmen and here are included items by authors, some of whom are not ethnologists but whose work is of sufficient value to allow its inclusion in this section. The items included in the small section entitled Bushman Folklore, include popularised versions of the work of Dorothea Bleek and Lucy C. Lloyd. The section on Linguistics is purely restricted to works available in Johannesburg and no attempt has been made to obtain works by the Portuguese students of the Bushmen or other foreign linguistic studies. This can therefore claim to be no more than a token coverage of a field, in which a vast amount of work has been and still is, being done. The section entitled General, contains work not sufficiently scientific to be included under Ethnology, yet of interest, often because of their excellent illustrations. This section begins with works published after 1900 and works of a similar nature published before this date, appear in History.

Sources. Mendelssohn, South African Bibliography provided some of the older items. Many of the older periodical references were traced through the bibliography in - I. Schapera, Khoisan Peoples of South Africa and the Johannesburg Public Library's Index to South African Periodicals was also used. A list of periodical abbreviations indicates the sources consulted. Periodical titles were written out in full when they appeared only once.

Brief annotations are given in some cases. Page references and an indication of contents, have been provided for some of the older items which do not contain an index.

My sincere thanks are due to Prof. L.F. Maingard, Prof. M.G. Marwick, and Mr. G. B. Silberbauer for their valuable advice, to Prof. Manuel Guerreiro for kindly sending material on the Portuguese contribution to Bushman Studies, of which I could include only a very small number, and to Prof. P.V. Tobias for so kinily allowing me access to his bibliography on cards in the Anatomy Department.

8. BURCHELL, William J
Travels in the interior of Southern Africa: reprinted from the original edition of 1822-4 with some additional material and with an introduction by I. Schapera. London, 1935. 2 vols. illus.

Index in Vol. 2 gives a valuable and detailed description of all the references to the Bushman.

9. CAPPON, James
Britain's title in South Africa or the story of the Cape Colony to the days of the great trek. 2nd. ed. with a new preface. 371 p. London. 1902.

p. 74-82 The Bushman race

10. CASALIS, Eugene
My life in Basutoland: a story of missionary enterprise in South Africa translated from the French by J. Brierley. London, 1889. 293 p.

p. 154-163 Bushman of the Maluti.

11. CHRISTOL, Frédéric
Au sud de L'Afrique. Paris, 1897. 305 p. illus.

p. 141-158 Bushmen, their customs and appearance

12. FARINI, G.A.
Through the Kalahari desert: a narrative of a journey with gun, camera and note-book to Lake N'gami and back. London,1886. 475 p. illus.

p. 252-256 Bushmen
p. 330-332 Hunting ostriches in disguise
p. 341-348 Collecting honey, making of tsamma "beer".

13. FARINI'S African pygmies or dwarf Earthmen brought from the interior of Africa by Mr. W.A. Healey for Mr. G.A. Farini. no imprint, (1884) 4 p.

A description of a number of Bushmen exhibited in London and described as "the most extraordinary type of the human race in existence".

14. GALTON, Francis
Narrative of an explorer in tropical South Africa: being an account of a visit to Damaraland in 1851, with a new map and an appendix... London, 1889. 320 p. illus.

14. GALTON, Francis
p. 164, 166-168, 172-174 Bushmen's use of traps and pits in hunting, superstitions regarding horned snakes. 113

15. GODDEE-MOLSBERGEN, E.C. ed.
Reizen in Zuid-Afrika in de Hollandse tijd. 'S-Gravenhage, 1916. 3 vols.

16. HOWISON, John
European colonies in various parts of the world, viewed in their social, moral and physical condition. London, 1834. 2 vols.

Vol.1 p.252-276 Bushmen

17. KOLBEN, Peter
The present state of the Cape of Good Hope: or a particular account of the several nations of the Hottentots; their religion, government, laws, customs, ceremonies and opinions; their art of war, professions, language, genius etc. together with a short account of the Dutch Settlement at the Cape written originally in High German by Peter Kolben, done into English from the original by Mr. Medley. London, 1621. 2 vols.

18. LE VALLIANT, Francois
New travels into the interior parts of Africa by way of the Cape of Good Hope in the years 1783, 1784 and 1785. tr. from the French of Le Valliant. London, 1796. 3 vols. illus.

19. LICHTENSTEIN, Henry
Travels in Southern Africa in the years 1803, 1804, 1805 and 1806: a reprint of the translation from the original German by Anne Plumtre. Cape Town, 1930. 2 vols.

Contains descriptions of the social life, customs and art of the Bushmen, use of "swimming logs" for crossing rivers described, the language of Bushmen and Hottentots discussed. [501]

The index refers the reader to other references on the Bushmens and their way of life.

20. MACKENZIE, John
Ten years north of the Orange river: a story of everyday life and work among the South African tribes from 1859-1869 Edinburgh, 1871.

p. 128-142
p. 490-493 The Bushman language
p. 509-513 Contact with Europeans

21. MACNAIR, James I. ed.
Livingstone's travels with geographical sections by Dr. Ronald Miller. London, 1954. 429 p. illus.

p. 20 ff., 27,31,49 Bushmen

22. MAINGARD, L.F.
The first contact of the Dutch with the Bushmen until the time of Simon van der Stel (1686) S.Afr. Jour. Sci. 32: 479-487 N. 1935.

23. MENTZEL, O.F.
A complete and authentic geographical and topographical description of the famous and (all things considered) remarkable, African, Cape of Good Hope... translated from the original German by G.V. Marais and Dr. T. Hodge. Rev. and ed. by H. J. Mandelbrote. Cape Town, 1944. originally published in 1787. Part 3 vol. 2 of German ed. 113

p. 260-263 The Bushmen of the Cape Province
p. 308-309, 330, 332, 334 Battles between Bushman and settlers described

24. MOFFAT, Robert
Missionary Labours and scenes in Southern Africa. London, 1842. 624 p. illus.

p. 6-14 Origin and history of the Bushmen
p. 49-64 History of Kitchener's mission to the Bushman. This section includes a description of their way of life.

25. MOODIE, Donald and PHILIP, John
Correspondence between Donald Moodie, Esq. compiler and editor of the Cape Records and the Rev. John Philip D.D. relative to the production for publication of alleged "official authority" for the statement that in the year 1774 the whole race of Bushmen or Hottentots who had not submitted to servitude was ordered to be seized or extirpated. Cape Town. n.d. 76 p.

26. MOODIE, Donald, comp.
The record: or a series of official papers relative to the condition and treatment of the native tribes of South Africa. Cape Town, 1960.
Bushmen also known as Soaqua, Obiqua, Soeswa, Strandloopers, Vischman, Waterman. [101]

27. MOSSOP. E.E. ed.
The journal of Hendrik Jacob Wikar (1779) with an English translation by A.W. van der Horst, and The journals of Jacobus Coetsé Janse (1760) and William van Reenen (1791) with an English translation by Dr. E.E. Mossop. Cape Town, 1935.
In these journals Bushmen are referred to as: Chaboup, Thaboek, Tkaboeba and Samgomonka. The journals contain numerous references to the Bushmen, their hunting methods and social customs. [101]

28. PRINGLE, Thomas
Narrative of a residence in South Africa. London, 1834. 116 p.

p. 77-80 Pringle believed the Bushman to have originally been a pastoral people. Commandos against them described. [104]

29. SHAW, Barnabas
Memorials of Southern Africa by Barnabas Shaw, Wesleyan missionary resident in the country nearly twenty years. London, 1834. 346 p.

p. 27-33 Bushmen customs and appearance

14: Willet Y-4 (no date) 1965 FX10 Bushmen FX10

30. SPARRMAN, André
Voyage au Cap de Bonne-Espérance,et autour du monde avec le capitaine Cook et principalement dans le pays des Hottentots et des Caffres traduit par M. Le Tourneur. Paris,1787.3. vols illus. 113

Vol.1 p.259-272 Bushmen, their poisoned arrows, huts
Vol.2 p.206-209
Vol.3 p 4-9

31. STEEDMAN, Andrew
Wanderings and adventures in the interior of Southern Africa. London, 1835. 2 vols. illus.

Vol.1 p.104-113 Atrocities, commando system
p.147-150 Description of appearance, arrow poison, weapons
Vol.2 p. 22-26 Use of rafts for swimming
p. 48-52 Huts, superstitions on thunder

32. SUTHERLAND, Lieut-Col. J.
Memoir respecting the Kaffirs, Hottentots and Bosjemans of South Africa. Cape Town, 1845. 2 vols.

Vol.2 p.589-712 Bushmen

33. SUTHERLAND, Lieut-Col. J.
Original matter contained in Lt.-Col. Sutherland's memoirs respecting the Kaffirs, Hottentots and Bosjemans of South Africa ... commentaries and notes on the text used in the compilation of the memoirs. Cape Town, 1847. 580 p.

p.501-557 Bushmen

34. THEAL, George McCall
Ethnography and condition of South Africa before A.D. 1505: being a description of the inhabitants of the country south of the Zambesi and Kunene rivers in A.D. 1505. Together with all that can be learned from ancient documents, books and modern research of the condition of South Africa, from the earliest times until its discovery by Europeans. London, 1910. 466 p. illus.

35. THEAL, George McCall
History and ethnography of Africa south of the Zambesi from the settlement of the Portuguese at Sofala in September 1505 to the conquest of the Cape Colony by the British in September 1795. London, 1907. 3 vols. illus. maps.

Contains numerous references to the Bushmen, the history of their conflict with other races, their social life and customs, etc.

36. THOMPSON, George
Travels in Southern Africa...comprising a view of the present state of the Cape Colony with observations on the progress and prospects of British emigrants. 2nd. ed. London, 1827. 2 vols.

p.273 The Commando system attacked
p.387-406 Relation between Bushmen and farmers in the Roggeveld
p.421-424 Bushman dances. Their notion of number

14: Willet Y-4 (no date) 1965 FX10 Bushmen FX10

37. TRANSACTIONS of the London Missionary Society Vol. 1. From its institution in the year 1795 to the end of the year 1802. 113

p. 325-341 Mission to the Bushman. Gives a description of their way of life but none of their beliefs

38. TRANSACTIONS of the London Missionary Society in the years, 1803,1804, 1805 and 1806. vol. 2. 1806.

p. 1-23 Mission to the Bushman by Kitchener

39. VAN DER STEL, Simon
Simon van der Stel's journal of his expedition to Namaqualand, 1685-1686 ed. from the MSS in the library of Trinity College Dublin by Gilbert Waterhouse. Dublin, 1932. 183 p. illus.

Contains references to contact with the Sonquas

40. VAN RIEBEECK, Jan
Journal edited with introduction and footnotes by H.B. Thom. Cape Town, 1952. 3 vols. frontis. map.

The first contact between Bushmen and Whites at the Cape. Bushmen also referred to as Soaqua, Sonqua and Souqua. [10]

14: Willet Y-4 (no date) 1965 FX10 Bushmen FX10

FX10 Bushmen FX10
!Kung

622 562 refer to one woman as a "headman"), nor does her husband. A headman's daughter, as it were, holds the place until her son is born to fill it. Primogeniture would be in force: the eldest daughter's son would take precedence over a younger daughter's son. If a daughter's husband is an effective person by nature, he could lead the band and perform the functions of headman indefinitely. The band, on the other hand, might find it more advantageous not to wait for a son to be born to the headman's daughter but to realign itself under another headman. Within the proper frame of kinship this is a voluntary matter.

782 539 (11) I paraphrase some of the prayers as follows:

"You have created me and given me power to walk about and hunt. Why do you lead me in the wrong way so that I find no animals?"

"Give rain, *!Nau*, wet the earth. Let there be veldkos. We are starving because we have to stay by the water hole where there is no more veldkos. You have favored some people with rain. Will you not favor us?"

Kung

101 Bushman language groups, Auen, Naron or /Kõ, to the south, or with other /Kung
582 whom the Nyae Nyae /Kung know to be living to the north-east and north-west of them.

619 The S.W.A. and B.P. governments administer the region as it lies within the
[648] territory of each but not as a unit in itself. The /Kung have developed no internal political organization to unite their bands. The unity of the region exists, in so far as we know, only in the minds of its /Kung population and in the fact of their intermarrying and being held together in a net of kinship and affinity.

648 About 1,000 /Kung live in the region. Roughly three-quarters of them live in 28
162 bands and are nomadic hunters and gatherers with no agriculture, herds, or beasts of
[621] burden. Approximately another fourth work for Chwana and Herero on their cattle posts on the periphery of the region. Most of these still have connexions with the interior bands and intermarry among them. In the interior there are no inhabitants
[177] other than /Kung, and no European or Bantu institutions modify the old /Kung way of life.

621 My study of /Kung marriage regulations is based on data derived during the
[114] years 1952–3 specifically from 14 bands with which we had the most contact and on which we gathered considerable genealogical material. These bands varied in size from 8 to 57 persons, averaging 25, with a total of 353. The marriage status of these persons as of 1952–3 is given in Fig. 1.

[162] FIG. 1. *The Marriage status of a sample of 353 persons*

Unmarried girls, adolescent and younger	58
Total	353

601 /Kung social organization is of the 'Eskimo' type, as defined by Murdock.[1]
[595] Theirs is the sub-type, which varies from normal Eskimo in that polygyny occurs and
[596] extended families are common instead of independent nuclear families in neolocal
[611] residence. Other characteristics are normal Eskimo. Descent is reckoned bilaterally,
[614] There are no exogamous unilinear kin groups. There is bilateral extension of the
[835] incest taboo. Cousin terms[2] are the same for cross and parallel cousins and cousins are differentiated terminologically from siblings. One term is applied to both FaBr and MoBr, another to both FaSi and MoSi, and these terms differ from the terms for parents.

621 As we examine their rules of exogamy we find that the band is not an exogamous
582 unit as such. Actually most members of the band are so interrelated by consanguinity or affinity that the marriage regulations strictly prohibit their intermarrying,

[113] [1] G. P. Murdock, *Social Structure*, Macmillan Co., 1949, pp. 223, 226–8.

Conclusion	59

122 The following work was carried out by order of the Command of the Northern District of the Protectorate Forces as the result of a suggestion from the Museum for Ethnology in Berlin.

114 After I had spent the months of August, September, and October of 1908 making the necessary observations, I was called away from Rietfontein (North) and thus out of the region of the ≠Auin [Auen]. This interruption of my studies, which had scarcely begun,

/135 cont./

114 accounts for the incompleteness and gaps in my data, defects which make themselves felt particularly in the last chapter. Thus, I could neither do the important section on linguistics nor make a collection of ethnological materials.

The observations and researches that I did undertake were repeatedly tested for their correctness to the best of my abilities. The possibility of error, of course, is nevertheless admitted without reservation.

Aminuis, August, 1908. Kaufmann.

General Observations

144 It is my conviction that the #Auin, as well as all other Kalahari Bushmen, do not represent a homogeneous race, but rather a people or, better still, several peoples who have lost their original character through mixture with one another and above all with peoples of other races (Bantu). At any rate, a number of Bergdamara [Bergdama] or Herero decidedly gives a stronger impression of derivation from the same mold than do the same number of Bushmen.

197 The linguistic differentiation of the individual tribes is sometimes so great that mutual intelligibility is impossible.

171 182 The apparent cultural homogeneity is probably based on the uniformity of the landscape that everywhere surrounds them and on the living conditions (Kalahari culture).

144 171 There is no doubt that an intimate relationship of some kind exists between the Hottentot and Bushmen. It may be that the Bushmen are degenerate Hottentot with some admixture of foreign blood, or, on the other hand, that the Hottentot are Bushmen with foreign admixture who have emancipated themselves from the Kalahari culture.

[114] 144 197 I believe I shall not be guilty of an indiscretion if I report that the ethnographer Dr. Pöch shares this view with me. In a private communication he writes to me from Kamelpan

/136 cont./ The approximate number of Auin,
162 naturally in the form of the very roughest estimate, is apparent from the following compilation:

There reside in the region of

Oas	about 300	persons
Dawis	" 150	"
Stampriet	" 250	"
Rooigrauwater	" 50	"
Korikas	" 150	"
Olifantskloof	" 200	"
Habakobis	" 100	"
Rietfontein	" 200	"
Tjumda	" 100	"
Go	" 150	"
Sidonitzaub	" 1,000	"
Karasburg	" 100	"
Epukiro	" 100	"
Ganab	" 100	"
Gam	" 100	"
Total	about 3,000	persons

[114] In my opinion the number of Bushmen living in the Kalahari (not only the Auin) has been consistently underestimated.

I wrote these lines in October, 1908. Today, in other words,
165 not yet a year later, I am forced to change my opinion, since
161 the malaria of the last rainy season has taken many victims and has decimated the Auin as well as the other tribes. According to the figures provided, I consider myself justified in suggesting that of the Auin estimated above at 3,000, only about half at most remain.

It is impossible to obtain more precise statistics since the
648 Bushmen successfully evade any kind of control. Even the administration of the protectorate takes account of this fact by dispensing from the outset with any registration or the like by the Kalahari Bushmen.

No special racial layers are to be distinguished among the
144 Auin, although it is doubtless true that certain individuals can be shown to have more Negro blood than others.

[1] Introduction

121 The purpose of my expedition, on which I was accompanied by my wife, Maria Lebzelter-Grammetbauer, was to study the anthropology and ethnology of the native tribes, especially of the Bushmen, as well as the archeology of South Africa. The original plan came from Professor Father Dr. Wilhelm Schmidt, S.V.D.
122 Repeated generous stipends from His Holiness Pope Pius XI made possible the continuation of the expedition, which was fostered with tireless zeal by Father Schmidt. The Austrian Government, by means of special administrative measures, made it possible for me to set out on this journey. Furthermore, the editor of Anthropos, Professor Father W. Koppers, repeatedly lent considerable support to the expeditionary fund. The Research Grant Board in Johannesburg granted me -- although for purely anthropological purposes -- a single subvention of 50 pounds.

114 I have already described the program and execution of my South African expedition in the first volume of this work. Here, before presenting the ethnological results, I should like to portray in rough outline how these results were arrived at. I must state in advance that there was a space of only three weeks between the time when the measures taken by the Austrian authorities made it certain that I could leave my homeland and my actual departure. Hence, a [122] more detailed study of the native languages was out of the question. The conditions under which a person today can do ethnological field work are fundamentally different from those of the pioneering era. [797] Through the activity of the missions, there is growing up among all [177] tribes, except for the Bushmen, a stratum of intelligent individuals who, if not in this generation, certainly in the next, will take over the research among their own people. I recall a lawyer's clerk in Natal (Swazi) who had acquired a pamphlet of ethnological lectures from Johannesburg and had learned it by heart. When he turned to a White ethnologist, in order to begin the practical work, the latter assured him that just as a race horse could not be used for plowing, so an ox could not be used for racing. Meanwhile, however, a number of very creditable works by natives have
115 already appeared in print. In my investigations I have always used native schoolteachers who had a command not only of the

[3 cont.]

123 the sum of the ethnological results obtained in each case is a func-
124 tion of the amount of "yellow" money that in each instance was available to me.

000 The results of my work, together with the space available to me, determined the size and content of this book. For the prehistoric cultures, I refer the reader to the first volume.

114 My original intention of giving a survey of those tribes
128 among whom I was unable to do research had to be abandoned in view of the amount of space placed at my disposal. I intend to do this in the final section of the third volume, where, along with the anthropological findings, an over-all survey of the cultural and racial history of South Africa is to be presented. I have
[127] referred to the literature at some length only in the accounts on the Bushmen tribes of South Africa. In particular the officers of the Imperial German Colonial Force performed extremely valuable pioneering work in this area. Their accounts, given with military exactitude, are unsurpassable and represent ethnological sources of the first rank.

126 Wherever I did not carry out the observations myself but wrote down the translations of my native interpreters, I have left them unchanged. Hence, I hope that the reader will not hold against me the stylistic defects that appear here and there. The native words for the most part were written down by my interpreters. I would have been happy if it had been possible for me to have all the texts checked by competent experts. This was impossible. I therefore request indulgence in case there are any errors in the linguistic transcription. At any rate, these people wrote their mother tongue. [Page 4 blank.]

[5] The Bushmen Tribes

172 In terms of geological eras, South Africa has undoubtedly been inhabited for as long a time as the other parts of the Old World. Naturally, the first cultures we know are those that possessed a stone industry. Among these the hand-ax industry, which is also the oldest elsewhere, is likewise widespread in South and Southwest Africa. Since Reck has most recently established

[5 cont.]

105 Ninde. They have stopped collecting veldkost and confine themselves to hunting, exchanging the products for vegetables and the like from the Mabunda [Bunda] and Luchazi, with whom they have a dependent relationship. Their time divisions are the same as those among the !Kung in the south.

The Angola Bushmen have two or three wives. Some of the married couples were cousins.

Each household has a number of calabashes, a few baskets, and a clay pot. Wooden pestles are used for pounding the grain, as in the south.

Among the Bushmen of Kunzumbia, the ear lobes and nasal septum are pierced. All adult men have tattooing on the forehead with vertical lines between the eyes. Furthermore, on the arm and chest they wear so-called "flesh marks" (2) [6] to

[171] 2. These are also found in Ongandjera and along the Natakanako Pan.

record the big game they have killed. The women, too, are tattooed. As weapons, besides bows and arrows, they have the kirri and a short knife. Spears are rare. Ironware, of course, is obtained in trade from the Bantu for the most part, although the Bushmen in Musombu already have their own forge.

[114] The rain dance is described by Bleek just as I have witnessed it. The women and girls stand in a group on one side, singing and clapping their hands, while the men also sing, but do not clap, and perform rhythmic movements with the upper part of the body and arms. They sing:

//nwa-se //kabama //gu a i-i New moon, come out, give us water
//nwa-se tatana //gu a i-i New moon, thunder water down for us
//nwa-se tala u//gu a i-i New moon, throw water down for us.

For the boys' initiation, the candidates withdraw into the forest with three medicine men for a month. There they dance at night, and occasionally the spirit Huwe appears at the dance. There is also a girl's initiation, and at that time another spirit, //Gaua, is supposed to lead the dance. The tattooing of the girls is done in his honor.

[20 cont.]

648 put themselves under a chief, a Herero half-breed named
621 Krüger, whose position was acknowledged" (see p. 87). "In
622 Naidaus a Bushman leader named Aribib introduced himself, who, like Krüger in the east, was recognized as the captain of the Bushmen in the west" (p. 88).

114 "During the journey of Captain Volkmann in the year 1902 to the Okovanggo, the !Kung Bushmen provided extensive help. Volkmann describes these !Kung in the following manner:
147 'The Bushmen, who are almost totally naked, are very sensitive to the cold. In the morning each Bushman has a burning log in
372 his hand, which he holds close to his chest. The other hand is placed on the shoulder with the upper arm pressed close to the body. At the resting place the log is used immediately to make
481 a fire. When a Bushman walks in front of the horse as leader, he
222 springs with incredible speed, now here and now there, to get a tuber or root out of the ground. Various berries growing on low
276 shrubs are also very popular. Anything that can serve is used as a tobacco pipe: kudu horns, calabashes, hollowed fruit of the Strychnos, old metal cartridge shells, and so forth. Most of all they like to smoke through water, which is never renewed. When they run out of tobacco, they boil the bark of a tree in the thick tobacco water, dry the bark, which has some tobacco taste, and smoke it' " (p. 180).

101 F. Seiner reports the following concerning the divisions
131 of this tribe:

"The Kung, to the best of our present knowledge, are divided into four groups. The western group seems to extend from the Portuguese border near Kurinkuru along the route via Tschitschib to the Omuramba u Owambo and then seems to be bounded by the latter and in the east by the line Nuragas--Blockfontein. The Karakuwisa group bordering them to the east inhabits the valley of the Omuramba u Omatako from Karakuwisa to Blockfontein during the dry season, and during the rainy season also the steppes 100 to 150 kilometers east and west of the Omuramba and the latter itself up to the Kanovlei. The more southerly group extends from the latter in the Omuramba to around Osondema; we shall call these Nog-au, who have already settled in the central Kalahari and can scarcely be classed with

[20 cont.]

101 the half-breed Bushmen, the Otjituo group. The Gam supposed-
131 ly dwell in the region west of the Omatako valley from Okanakasewa to Omambonde. The most serious complaints are
[648] lodged against the western group, which, in the opinion of the
[631] District Office, is for the most part under a single head chief, the notorious Namagorub, and is called !Kung-au (that is, !Kung people) by the other Bushmen. The Karakuwisa chiefs, Gnani and Ma, both crippled, are worth mentioning, and further, the leaders of the burglars of Blockfontein, Gachu and his brother Tamburi; no one, however, has as much power as the notorious Namagorub."

According to Vedder, the Bushman tribe of the Masi-
[197] Keren live in the forests south of the Otjimpolo Veld. They do
[342] not understand the !Kung language; they live communally in
[301] large rectangular houses and make incisions in the upper thigh
[827] in order to be able to run better. Their arrows have large iron
[411] points that are not poisoned.

2. On their Character

157 In character, the Bushmen differ among themselves just as much as the members of any other people. The various types of disposition already point to this fact. In view of the relatively brief period that I was able to spend with the individual Bushmen, I do not want to give too much significance to individual characteristics. The character of a people, if one can speak of such, [21] manifests itself in the average conventional or traditional kind of reaction in different situations, and, in spite of the physically conditioned differences in character, this kind of reaction nonetheless displays a certain broad uniformity.

Since among the other Bushman tribes my observations
[114] were less detailed, I shall report everything worthwhile that I observed here.

When he is confronted with something new, the Bushman at first acts relatively uninterested. He has little curiosity. On the other hand, two !Kung Bushmen did once demand of me a detailed explanation of the motor, and they listened patiently to my account. When an American once gave a phonograph concert, they listened to it with obvious pleasure, but none of

/22 cont./

181
648

appropriated a number of little trees and planted them in front of his house. On one occasion when he was in town with his Bushmen, the original owner of the trees declared that in the afternoon he was going to see about it. The Bushmen heard this and disappeared. When the two Whites came to the farm, the little trees had disappeared. The Bushmen had run ahead and had hurriedly removed them on their own initiative.

181 The Bushmen are at all times courageous and steadfast people, characteristics which, indeed, their very way of life would produce.

831 The Bushmen strictly avoid talking about sexual matters
[864] in the presence of women and children. Just as in general they are a people without imagination, they do not have any form of the more subtle erotic phantasies.

The endless obscene stories that one hears from the Blacks as soon as he has gained their confidence are unknown among the Bushmen.

The sexual element is absent in their religious cele-
[535] brations, but it finds expression in many of their dances, which imitate the love play of animals.

834 On the whole, their sense of modesty cannot be denied, even though, naturally, they do not have such decent forms of conduct as the genteel Bantu, among whom it is regarded as extremely improper to look at the breasts of the women. The
[516] girls and women never sit in the typical squatting position, but rather sit on the ground with the legs crossed.

(576) Although the life of the Bushmen within the encampment is openly in view, those principles that we regard as natural tact are nonetheless observed.

[514] The Bushman performs his necessities at all times out of sight of the others, and love scenes are never enacted in public.

● 114 It is naturally very difficult to learn anything more
124 precise concerning the more intimate details of sexual life

[22 cont.]

114 without compromising oneself. Only old people are suitable
124 informants, since they are no longer eager for renown.

831 In view of the hard life that the people lead, sexuality, naturally, is not excessively developed. Perverse manipulations are evidently unknown, since my informants did not even understand questions on this subject.

833 Normal sexual intercourse is usually performed in the bush during the time between the evening meal and the rising
271 of the moon. Long periods of thirst result in almost total im-
147 potence.

157 Despite all the formality, they have an unbridled
578 temperament which frequently expresses itself in violent emotional explosions over trivial affairs, which then may easily lead to serious consequences since the poisoned arrow is always at hand. For example, I was told the following story: A Bushman worked on a farm for quite a long time and, with his belly fat from eating maize, came to visit his thin companions. His brother made fun of him for being so fat, saying that he could not run any more, whereupon the fat one retorted: "Just the same, I'll live longer than you." After this brief exchange of words, the scrawny brother stabbed the fat one. -- A film com-
157 pany once wanted to make a film among the !Kung who are
648 settled behind Keibeb; the film was to be called: "When the First Whites Came into the Land." The chief of this horde had a [23] pair of old German military trousers as an emblem of his office and when he was requested to take them off, he responded with the declaration that he would take off his trousers only if the White did the same, whereupon he received a box on the ears that put him and his companions in such a rage that the film company preferred to depart in order to avoid a catastrophe.
157 That they can also be quick at repartee is shown by the following story which was repeatedly told to me by Europeans: A Bushman had been accused of poaching. The magistrate asked him: "Don't you know that these animals belong to the king (royal game)?" The Bushman answered: "I saw no 'brand' (property mark)."

As a chief or family head, the Bushman is bossy and
[593] unyielding, which is understandable in view of the rigidity of his whole conception of life. The sick Bushmen lie silent and

[23 cont.]

105 and in the beyond by his traditional conceptions, and the preserva-
182 tion of this adaptation, in the spiritual as well as in the material realm, is achieved by means of a strict selection of all the cultural goods offered from the outside. This selection is consciously carried out. Put briefly: the Bushmen have hitherto refused higher
[177] economic forms not because they do not possess the ability to handle them, but because they did not want to adopt them. If the material preconditions collapse, then they adopt, step by step or all at once, totally different ways of life, as is shown by their Bantuization in Ovamboland and probably also by the formation of the Hottentot people through the adoption of livestock raising on the part of a number of Bushman tribes. Their average intelli-
[153] gence is no less than that of any other race. Every Bushman knows
[184] the entire spiritual heritage of his tribe.

Of the same Bushmen, F. Schinz (2) says:

[113] 2. F. Schinz, Deutsch-Südwestafrika, Leipzig, 1891.

181 "The Bushman is always faithful to his master and will follow him anywhere without pay; one need not worry about leaving him alone at the wagon and will rarely have to reprimand him for dishonesty. All travelers and hunters unanimously praise
[593] the great affection that exists between parents and children, which goes so far that the father or mother will sacrifice themselves in order to save their child. I was told [24] by the hunter L. that at the Okovanggo he once witnessed a scene in which a young Bushman, who was one of the members of the hunting expedition, was in danger of being trampled to death by an angry elephant that stormed toward him. At the last moment when his paralyzed companions had already given the boy up for lost, his father sprang forth and flung his throwing club at the forehead of the enormous animal. The elephant now turned against his new attacher and furiously crushed him under his feet, giving the son the opportunity to flee."

[114] My observations are fully in accord with those of Dornan (1)

[113] 1. Dornan, Pygmies and Bushmen of the Kalahari, London, 1925.

[27 cont.]

221 Bushmen shrink to miserable skeletons. Many of them at this
[648] time[1] run to the Blacks or Whites in order to earn something. In
[731] dry years no attention is paid to the kin group boundaries. All
[423] gather around the few water holes that are still open. As soon as the rain begins, conditions start to improve; the people start moving out in various directions, not to meet again until several months later at the time of the veldkost harvest here and there.

7. The Course of Life

584 I shall render in literal translation the account that my informant gave of the way a young man courts a girl:

If a young man wants to marry a girl, he must first speak to her and say: "I love you and want to marry you." If the girl is willing, she says first: "You must wait." Then she goes to her parents and asks them whether they have heard that the boy has spoken to her. The parents then ask whether the girl wants to marry the man. [28] If the girl says, "Yes," then the parents say, "He wants you; he has seen that you are good and hard-working; you may marry." If, however, the young man has thought the matter over and takes back his words, the girl goes to her parents once more, and the boy to his. The latter say: "You wanted it this way; nothing can be done about it." In case the girl definitely gives her consent, however, the young man brings all kinds of little presents and gives them to his future bride, who takes them to her parents. The parents-in-law must now in turn give presents. With the exchange of presents, the
[583] marriage is regarded as legally concluded.

●[114] The hunting test described by Passarge (1) and others is not
224
584
[113]

1. Passarge, Die Buschmänner der Kalahari, 1907.

the rule. Some vain girls demand it, and sometimes young men will voluntarily go through with it in order to beat his rivals. This hunting test is carried out in the following manner. The boy goes hunting without weapons and pursues the game (as a rule,

1 [i.e. The hot season -- Analyst]

[29 cont.]

553 The custom of spitting is undoubtedly original, not a substitute
852 for well water."

551 The father gives his newborn child a name. The boys usually receive animal names, commonly that of the grandfather, and the girls, plant names. Albinos are unknown among the !Kung
[142] tribes visited by me, but a horde of Bushmen with red eyes is supposed to live in the eastern Sand Veld in the region of the
[845] Dussidum. I have never seen twins; they are probably done away with. The children are breast fed for a long time; older infants
853 learn to squeeze the milk out of the breast with their fingers or pull with their teeth on the leathery nipples. The assertion of
847 other travelers that the women kill their children if they are born
[114] before the previous child has been weaned is allegedly not true of the kin groups visited by me. On the other hand, Vedder (1)

[113] 1. "Zur Vorgeschichte der eingeborenen Völkerschaften von Südwestafrika. I. Die Buschmänner [On the Prehistory of the Native Tribes of Southwest Africa]," by V. Vedder, Journal of the South West Africa Scientific Society, Vol. I, p. 10, 1925-1926, Windhoek, 1927. -- Cf. also Von Zastrow and H. Vedder, op. cit., p. 414.

reports:

"I must mention one other custom which likewise considerably contributes, and may have contributed in prehistoric times, to the Bushmen being so few in number. Custom demands that a child born when the older child of the same mother is not yet three years old be buried alive. This is a gruesome custom. I spoke about it with a racially pure Bushman. My remonstrances did not convince him at all. He explained: 'We Bushmen are poor people. We have no goats and no cows to give our children milk. If the woman brings two children into the world within a period of three years, we don't know what the older child is supposed to live on if the newborn child uses up the mother's milk. It cannot live on the hard veldkost or on tough meat. The teeth are not yet strong enough. If we let the newborn

[30 cont.] VON ZASTROW
113 and Vedder (1) report further:
1

1. Von Zastrow and Vedder, Die Buschmänner, pp. 412-413.

843 "It is absolutely against the rules to do anything by word or
754 deed to the pregnant woman that might make her angry. Her evil eye in this period is especially dangerous; her angry word or her curse has an even worse effect. Sores, illness, protracted suffering, and death are the consequences of the evil eye or the curse of a pregnant woman.

844 "It is customary to sever the umbilical cord with an instrument only when the blood no longer pulsates. The umbilical cord is not tied off. The afterbirth must be carefully and secretly buried. The life of the child would be greatly endangered if an animal found it or if a feared sorcerer could appropriate a piece of it."

881 As soon as the girls have their first menstruation (/n) (2),

2. Female genitalia (/n-i).

a celebration takes place, but in this tribe I was unable to learn any of the details. On this occasion, the women dance, clap their hands, and sing, "giriri, giriri, giriri, uhu, giriri uhu," and so forth.

Men may not be present at this celebration. In a Hei//om horde neighboring the !Kung, spirits are appealed to in all directions on the occasion of this celebration, so that the girl, as an adult, will find veldkost everywhere.

The existence of a true initiation for boys is denied (3).

[114]
[124]

3. On this point I was either misunderstood or told a falsehood.

There is merely a kind of testing; an older man goes with the candidate or candidates on a hunting expedition. Under the supervision of the older person, the candidate must kill a specimen of large game. The animal is then brought to the sacred fire, at which the

[50 cont.]

751 concerning the witch doctors:

756 [51] "The sorcerer can protect himself against the malignant spirits of evil deceased persons. After all, he can see them and knows the means for defending himself against them. The ordinary Bushman has no eye for them, but he has a means of keeping them at arm's length. In a small leather bag about as long as a finger [411] he keeps a bow carved out of horn and numerous horn arrows stuck in a shaft of sour grass [Cyperaceae]. If he has occasion to fear evil spirits, he shoots these miniature arrows in all directions with his miniature bow. Now the evil spirits cannot get at him.

"Since in addition he has the belief that an object merely thrown in the direction of a hated person in some mysterious fashion enters that person's body and gravely harms him, he likewise uses his miniature bow to keep a pursuer or enemy off his neck by shooting an arrow, with a curse, in the direction where he imagines his enemy to be, even when he knows that this person is miles away from him."

Whereas I myself and the highly experienced J. Lunkenbein 411 regard these Bushman revolvers as harmless magical instruments, [114] Seiner has a different opinion:

"The 'revolver' is a definite instrument of murder carried hidden in the modesty apron. The bow is ten centimeters long, the arrows are from ten to 12 centimeters long, and with the former they are put in a little bag adorned with beads. In addition it should be noted that the arrows, which are wrapped crosswise with little bands of tendon, are poisoned by being smeared with [278] little bits from the body of the arrow poison caterpillar. The Bushman ordinarily crushes a few of the caterpillars, which are available only in December and January, living on a few Commiphora shrubs (Commiphora dinteri, C. seineri) or as pupa at the roots under the ground, in a bone vessel with a little wooden stick that is always in the quivers; then he smears the arrow with some sticky stuff, such as wax or resin, whereupon he brushes the arrow with the viscous, slimy caterpillar mass, which, after drying, covers the arrow as a more or less thick brown crust. Up to a distance of seven meters it is possible to puncture the skin, drawing blood, with this miniature arrow; if the arrow tip were not blunt but pointed, like the one placed in the grass shaft, the arrow would

[54 cont.]

171 of various religions have found entry here. Among the Bushmen
177 tribes I visited there is the common belief in a supreme good be-
171 ing, whose name varies. The people described here [55] call the
176 supreme being X'u, "the lord" or "the great captain" (1). It is

[782]

1. According to Vedder, the supreme being is Huwe (Tsumeb). When the first veld fruits ripen, an offering is brought before sunrise. A freshly broken twig is inserted into a piece of wood with a hole bored through it. The people are seated in a circle, and the eldest passes around a tobacco or dacha pipe made out of a tubular bone.

the same expression that the Cape Hottentot used in speaking to the German traveler Kolbe, with the same significance and pronunciation 705 (2). The name could not have come from the

114
171
176

2. J. Schapera (The Khoisan Peoples of South Africa, 1930) has critically referred to my observations on this point. In this connection I must note: the "great captain" among the eastern !Kung may rightfully be designated as "supreme being." I have already given his characteristics in my earlier publications.

[104]
[194]

The spelling is correctly X'u. I use X' to designate a click that is even lower than "!". It is also found in other words, such as X'Ame = lion. Since not all publishers provide this character, I have sometimes been forced to write "Khu" or "Chu." This word, which the !Kung, too, translate as "lord" or "great captain," was already found, as Schapera indicates, among the Cape Hottentot in 1705 as Khourou = "Supreme Ruler" and "Great Chief" or "Great Captain"; Kolbe gives a quite analogous citation a little later, and Hahn reports of one old Nama, "The people say,

[CONTINUES ON p. 108 - ANALYST]

[55 cont.]

171
776
114

if it is thundering, the Lord (Khub, i.e., Tsui//Goab) is speaking; he is scolding them" [cited in English], Schapera, ibid., p. 381.

The belief in a great captain was therefore common to the !Kung Bushmen and the Cape Hottentot, and the great age of the reports from the Cape exclude the possibility that missionary influence was at work here. Just as among the !Kung, this belief is apparently of very great antiquity among Miss Bleek's Naron and not simply taken over from the Christian Hottentot. In Ovamboland the concept X'u merges with Huwe, and I believe that J. Schapera, too, regards Huwe, Chuwe, and X'u as identical. The fact that the eastern !Kung have the belief in a supreme being was not discovered by me; rather, this discovery was made as early as 1910 by H. Vedder.

[174]

Everyone must be struck by the fact that there is substantial agreement between the reports concerning the heavenly house that I took down among the eastern !Kung and the data that H. Vedder supplies concerning the /Gamab of the Honigkaffir of the Otavi mountains. To be sure, these regions are also close to each other geographically. The question now arises: did the !Kung take this doctrine over from the Honigkaffir, as Schapera appears to assume, or is the reverse the case? Among the Bergdama of the central region, where I was able to carry out extensive studies, especially in the reservation of Okombahe, there is scarcely anything of these conceptions of the Honigkaffir. The Bergdama are a Negro tribe that has completely lost its original culture and language and for a long

[55 cont.]

114
171
776

time had a dependent relationship with the Bushmen, whose quite miserable imitators they had in part become. Even today Bergdama who want to become witch doctors go from Windhoek and Okombahe to the !Kung in order to learn there. If the conceptions of the Honigkaffir reported by H. Vedder were indeed ancient Negro cultural traditions, then it should surely be possible to find parallels and, at least in the names referring to the beyond, traces of the old language. Almost always among the Bantu the world of the beyond lies under the earth, whereas among the Khoisan it is in the sky. For all these reasons, I draw the conclusion that the Honigkaffir have taken over the doctrine of /Gamab from
[177] the !Kung. The expression Erob or Elotse, which is to be found among several Bushman tribes, undoubtedly goes back to Christian Hottentot influence. The two-fold names of the supreme being among various groups in Ovamboland, on the other hand, allows one to conclude that here only one new name for a well-known conception found entry, and,
[824] to be sure, with such intensity that the Hei//om, at the Etosha Pan, for example, name their most important medicinal root the Erob root. Moreover, just as among the Honigkaffir, among the Hei//om of the Etosha Pan, too, it is /Gamab who sends thunder and lightning and who kills people with shooting stars. J. Schapera recognizes that the conception of Huwe, Thora, and the mantis as creator, as the giver of rain and success in hunting, and as the protector of human beings is common to all Bushmen (ibid., p. 195) and also has its analogue among the Hottentot. He seems to regard this being as a rain god, however.

[55 cont.]

114 171 776 [775] //Gaua, whose name varies, stands opposite him as an antagonist who does harm to human beings. Schapera believes that the original designation //Gaua stood for the spirits of the dead. This is largely correct. My researches in various places, however, show that all kinds of noncorporeal beings are understood by the term //Gaua, in other words, spirits in our sense, and immaterial forces of all kind. The great captain, of course, is regarded as actually corporeal by the !Kung. P. W. Schmidt, on the other hand, has regarded this //Gaua as the original god in heaven. A comparison of the facts of the history of religion may support this view.

114 776 771 If I understand Schapera correctly, we agree that a benign high deity is indeed present among the Bushmen, but one that he does not want to designate as the supreme being. I maintain, however, that this being must be so designated in accordance with general usage. [174] The peoples of the Khoisan group, according to the evidence of the prehistoric finds, have an active history behind them; the most diverse races live on in them, and their culture in its optimal adaptation to environmental conditions is to be regarded as a residual culture. It is therefore self-evident that their world view should have a syncretistic character, especially since religious ideas are cultural elements with definite tendencies to diffuse widely. Like all human beings, the Bushmen and other primitives have thoughts that are fundamentally the same as ours. [773] Even the Bushman has a distinct need to discover causality, but this need is felt less with regard to causal or conditional explanations for given conditions and more with regard

[55 cont.]

114 776 771 773 to processes. Hence, among the primitives we find carefully thought out conceptions concerning the origin of the world of animals, human beings, and plants more rarely than a clear answer to the question concerning the originator of the actual processes, that is, of rain, storms, sickness, death, and, generally, good and bad fortune in human life. This originator is conceived as either a human-like being above the clouds or ancestral spirits. The religious need or the need for protection is also generally oriented in terms of 114 these two conceptions. The greater the significance accorded to the benign ancestral spirits 771 776 and the extent to which they can be influenced by magical practices, the smaller the significance of the heavenly being conceived as a general causa officiens. J. Schapera will doubtless agree with me whan I say that, in contrast to the Bantu, the need for a causal explanation and the religious need for protection are oriented around Thora, Huwe, /Gamab, and others, and that among the Bushmen this heavenly being therefore plays the role that we impute to a "good supreme being." By way of a critique of the Bushmen's conceptions it should be emphasized that the Bushmen, like all primitives, systematize their religious conceptions only to the extent that this is necessary for the satisfaction of their religious and causal-explanatory needs. We shall thus encounter varying degrees of consistency in the world picture from group to group, even from individual to individual, and no investigator will be able to discover a thoroughly organized system of Bushman religion since such does not exist. Whatever I could get from my

MASARWA

[62]

Chapter 7

The Bushmen of the North

114 Our best information concerning the Masarwa comes from Dornan (1) and Holub (2). In what follows an outline sketch will

[113] 1. Dornan, Pygrines and Bushmen of the Kalahari, London, 1925.

2. Holub, Die Masarwa.

be given of the culture of this tribe, based upon these two authors.

342 According to Dornan, the Masarwa once preferred to live in caves, where their ancestors had made paintings. The Bushmen in the Wankie and Ngami districts have plaited mats of grass [285] or reed, with which they cover their windscreens. Sometimes they make a kind of roof covered with grass; otherwise they have ordinary windscreens.

[532]
[172]

Fig. 21a. Representation of a Curing Scene. In the background, the female doctor who serves as oracle. (Eastern Cape Province. From J. P. Johnson, The Prehistoric Period in [113] South Africa, 1910.)

322 For the wood of the bow the Masarwa use very straight 411 little tree trunks. After the bark is removed, they are tied to a straight tree and left to dry. The wood is then given its final drying over the fire and is placed in water so that it will not splinter. The middle of the bow is also commonly wound with tendons. The bow is often greased and never unstrung. The finished bow is smoothed with a rough stone.

[58 cont.]

775 From there they make their rounds. They always return to their
769 graves. Hence, a Bushman always makes a detour around a grave. He does not point at a grave with his finger, and he does not call to a companion: 'There is a grave!' A great detour is made around the area where there is a grave. When a Bushman unexpectedly passes a grave, he puts a stone on it. That is a greeting for the dead person. In so doing, one makes the grave more secure against wild animals."

769 From the region of Foxhof I have the following informa-
775 tion to add:

"The Gauab that arises from the flesh of the corpse remains seated by the grave. When a relative passes by and the Gauab is sitting out in the open, the Gauab thinks: 'I know this person well; why is he passing by here without giving me any water. Then the Gauab becomes angry and makes him sick. Then when the doctors sing, they recognize what the trouble is and say: Today you passed by the grave of N. and did not give anything. Tomorrow morning very early you must take water and an ostrich egg and place them by the grave. Such a Gauab also
775 goes hunting, kills game, makes a fire, cuts open the game,
787 takes the fat, and brings it to the doctors while they are singing.
[756] The Gauab, whom the other people cannot see, sits down at some distance from the dancers. The doctor sees him, however, and goes to the Gauab. The latter tells him where the game lies, and the doctor tells this to the other people, who fetch the game and praise the Gauab.

775 "The stars are the campfires of the Gauab.

"The Gauana take the souls that they have stolen to their village and then back to the grave. The people often hear a voice in the veld; this is the Gauab calling, and on their way they find a piece of dead game. When the Gauab is out hunting and has gone too far from his grave, he must sleep in a tree. Some of the souls stolen by the Gauab are brought to the captain of the Gauana. The souls that are taken there again become actual persons up above with the captain of the rain. The others, however, are the little Gauab who go hunting here."

[114] The observations made by Bleek (3) 50 years ago seem to
776 be especially significant.

3. W. H. J. Bleek and L. C. Lloyd,

[113]

[55 cont.] WHATEVER I COULD GET FROM MY
114 individual informants I took down with the
771 exactness of a trained scientist, faithful to
776 the letter and with due regard for all pre-
[124] cautions. From these notations I have drawn the inevitable conclusion that a benign supreme being is a reality in their world picture.

776 surrounding Hei//om tribes, [56] for they use the word Somseb.
171 We should sooner think of Huwe. Huwe or Hue was what the !Kung Bushmen of Tsumeb examined by Vedder called the supreme being. I also know the expression Chuwa from the Bushmen of Ukuambi. This supreme being is conceived of in human form;
776 it looks like a Bushman and also speaks Kung. He lives in the sky
772 in a house that has two floors; his wife, whose name is unknown, lives on the lower floor, as well as many children. The souls
[775] of the deceased live on the upper floor. "The house" (it is supposed to be similar to, but not entirely like a Bushman windscreen) "is hairy on the outside, like a caterpillar." There are various things up there, but only a single house, namely, that of the captain. Honey, crickets, and fat flies are there in great abundance. The great captain lives on them. In addition, there are a great many butterflies. The following are regarded as the
776 functions of this supreme being.

1. In the opinion of some, the great captain made the sun, moon, and everything. In the opinion of others, the highest of the spirits, /Nawa, did this.

2. The great captain calls the doctors to their calling and gives them supernatural power.

3. He is the lord of the rain and the lightning.

4. Through the highest of the spirits he sends luck on the hunt or on the search for veldkost.

5. When someone thinks or speaks ill of him, he punishes
[688] him with lightning. He is not concerned about the other activities of his Bushman children, however, unless someone swears falsely.
695 The Kung have a regular oath, and one of my informants reported
776 the following to me:

When a group goes hunting and one of the participants is

[68 cont.]

1. Birth and Childhood

844 Among the ≠Auin, the husband of a woman in childbed slings the string of his bow around her stomach, but he is not present at the birth itself. The cord is severed with the tip of a reed splinter.

Among the Naron and Nogau, the delivery proceeds as it does
844 among the !Kung; an old woman usually provides assistance, however.

Twins (Hoi-holi) are not desired; among the Nogau one of
845 them is killed.

Among the Nogau, the father gives the child its name.
553] There the child has its umbilical cord severed by means of a
844 sharp quartz splinter. A woman in childbed may not eat blood and head meat. Until the child is able to sit up, the husband
[833] may not cohabit with the mother. The latter custom is also found among the Betschuana. Nogau children are not allowed to eat
262 the flesh of the wildcat and of two birds (tsugnussi and /gui).
●[114] Kaufmann has made some observations concerning children's
524 games; Bleek also provides some data:

Among the ≠Auin little bows and arrows serve as children's toys. The same applies to the Naron and Nagau [sic]. Stilts
[481] are known among the Auin and are used by men and boys. Con-
524 cerning children's games among the Naron, Miss Bleek reports:

The Game of the Big Water Snake

A boy crawls on his stomach to a small pile of sand which is supposed to represent the waterhole. At some distance from it, the children sit in a row, one behind the other, in such a way that each one sits between the legs of the one behind him; he puts his hands on the shoulder of the person in front of him. The biggest child [69] always sits at the front, the smallest at the back. They sing a song that in part is no longer intelligible. (Probably in the children's language.) This big "snake" now moves very slowly around the waterhole, while the water snake from time to time throws sand on it; then the others withdraw. At the end the snake catches one from the row and "eats it." I

[74 cont.]

773 him. They go to their huts which are under the horizon in the
821 west. At night or during the day, respectively, they go back to their huts in the east; one can hear them but cannot see them."

114 Kaufmann was unable to discover anything concrete con-
776 cerning the high gods of the ≠Auin. Concerning the Naron, Bleek
776 relates that a curious mixture of religious conceptions has come about. A central position is occupied by Hise or Hyesa, who is designated as !Khuba or !X'uba by the adult men. The old people knew nothing about this. The Nama designate !Khub as master or lord, and this word is used by a number of missionaries for Christ. These elders maintain that this concept has been adopted
[177] from the Nama. Formerly they only knew Hise, who lived in the east. Hise is evidently the same as Heitsi Aibib (literally, "the first tree").

The Naron relate that in olden times both the trees and the
773 animals were human beings who were transformed by Hise into their present shapes. Then Hise called the chiefs of the Whites and Blacks and said to them: "Take cows and goats and live with them." But to the first chiefs of the Bushmen he said: "Take the antelopes and live on them; make traps and hunt and live in the bush."

The expression Huwu or Huwuba is known and is supposed to
776 designate the great captain of the men in the north. The details given by Miss Bleek concerning //Gauwa are interesting. In the opinion of the Naron and ≠Auin, //Gauwa is the spirit of a de-
[775] ceased person. Medicine men can also see these spirits; the
[776] women can only hear them. Many a woman declared that only men who had gone through the initiation ceremony and who have two scars between the eyebrows can become //Gauwa. A strong, howling wind is also designated as //Gauwa, however. A few individuals also believe in a chief spirit by this name, who lives near Hise in the east and to whose house the spirits return by day. Some designate //Gauwa as the younger brother of Hise; others identify him with the latter.

The Naron put both masculine and feminine endings on the word Hise. Among the ≠Auin he appears during their dances at

[78 cont.]

it with the fingers. [Fig. 29 appears here.]

[79] The lion is neither eaten nor hunted. The jackal and leopard are eaten, as is the liver of the latter. Baboons are not eaten, because they were formerly Bushmen.

The line of tattooing between the eyebrows make people into leopards among the Nogau. The Naron smear themselves with red and black color. The other incisions and tattooing are made purely for adornment.

Among the Naron, millepedes are regarded as creatures of Hise, and only doctors may touch them and make medicine of them. Among the Nogau and ǂAuin there are magical bones that are used to predict the future. The Naron also believe that the rock engravings stem from //gauwa.

Among the Auin it is forbidden to eat hyena flesh, and likewise the flesh of the shabrack jackal because it is a dog.

The following important data supplied by Gentz (1) should

1. "Einige Beiträge zur Kenntnis der südwestafrikanischen Völkerschaften [Some Contributions to Knowledge of the Southwest African Tribes]," Globus, Vol. 83, 1903.

be added:

"I have repeatedly found Bushman arrows on which the point, usually made of bone (for the most part ostrich bone), was made of wood. The game sling, reproduced in Figure 29, is constructed as follows: A strong string, four to five millimeters thick, which at one end terminates in a simple loop, is fastened at the other end to a flexible young tree or branch that is bent far over. A small, thinner string with a transverse stick is attached at the loop end. The string is placed around a small post driven into the ground at an angle, and it is prevented from slipping off by means of a flat piece of wood buried under the ground and planted against the free end of the transverse stick; the sling is placed in a circle on the ground over the flat piece of wood. The game, which follows its customary track to the

Kung

test this factor and eventually we learned that there are two aspects to the /Kung system of kin terminology. In one terms are applied according to the biological position of the persons; in the other terms are applied because persons are classified with others by having the same names, in ways this paper will explain. The factor of the name has resulted in kin terms being applied by persons who have no consanguineous or affinal ties, but who are considered to be related through the factor of the name in what we call the name-relationship.

Miss Bleek in her paper on 'Bushman Terms of Relationship'[1] has recorded /Kung terms. Students of the subject interested in comparing her paper with this will find them in agreement to a considerable extent, but Miss Bleek's paper does not go so deeply into the terminology as this does nor does it bring out the significance of the factor of the name.[2]

Our material on /Kung kin terminology is presented in two parts. (I) The first part (A) deals with terms applied to consanguineous kin, and explains the factor of the name and the way the application of terms is extended through the factor of the name to persons who have no consanguineous or affinal ties, in what we call the name-relationship; and (B) deals with terms applied to affines. (II) The second part deals with certain aspects of behaviour related to kin terminology, touching briefly upon marriage prohibitions and preferences from the point of view of terminology. It deals more fully with the joking relationship, an aspect of behaviour which relates closely to terminological categories. The paper finally touches upon the way the name-relationship serves as an amalgamating factor within a whole region among people who have no larger organized social units than autonomous bands, small ones of 10–15 persons up to large ones of 40–60 persons, composed of consanguineous kin and their affines.

Space does not permit here a description of the composition of bands, but we hope in a future publication to give data on the family and bands, on hunting and veldkos territories, marriage, residence, settlement patterns, and on the behaviour among kin in forming hunting and gathering parties, arrow-lending, meat-sharing, gift-giving, &c.

[1] D. F. Bleek, 'Bushman Terms of Relationship', *Bantu Studies*, vol. ii (1923–6), pp. 57–70.

[2] Miss Bleek (ibid.) sometimes gives the descriptive phrase in place of, or in addition to, the term, as if we should say father's brother or mother's brother instead of uncle. For instance, *ha siy* is a descriptive phrase meaning father's younger brother or younger sister. There are differences of spelling. We should like to follow Miss Bleek's spelling, but we put down as best we could what we heard and cannot change over to her spelling because in the different areas the Bushmen's pronunciation may possibly have varied slightly. There are some terms given by Miss Bleek which we did not hear in the Nyae Nyae region. The /Kung of Nyae Nyae do not use the term *tsau* for Br. We did not hear *||ge*, nor *soiy||ge*, nor *tsa* as a prefix to *siy*. Otherwise the terms we record are recognizable as the same terms which Miss Bleek records. Miss Bleek, on the other hand, does not record all the terms which we record as used in the Nyae Nyae area. The principal difference lies, we think, in her not taking into account the factor of the name. We think she had an inkling of there being such a factor among the /Kung she worked with, for she says they had a word */ku* which she thought meant 'kinsman' or 'namesake'. In any case, she does not show all the terms which in the Nyae Nyae region might be applied to grandparents, grandchildren and collaterals on both the paternal and maternal sides. A detailed comparison of the papers would show several examples, but one will suffice to illustrate the point. Miss Bleek records the terms for FaBr, *tsu*, and MoBr, *tsau||ga*, giving the impression that the /Kung system makes a terminological distinction between the paternal and maternal siblings, whereas we found that in the Nyae Nyae area both terms, *tsu* and *tsau||ga*, might be used for either FaBr or MoBr, and, besides, that the sibling term, elder Br, might also be used for FaBr or MoBr, as will be explained.

5:Marshall E-5 (1950-1955) 1957 FX10 Bushmen FX10
Kung

Here are the parent–child terms:[1]

Fa	ba (b^ha)[2]
Mo	dai[3] (t^hai)
Mo (voc.)	aiya (āiya)
So	/ha (ŋ/^ha)
Da	≠khai (ŋ≠kxai)

601

These terms are subject to no modification. They are used by a person for no other relatives than his biological parents or offspring and no other terms can be applied in these relationships.

Sibling terms are as follows:

elder Br	/go (/o)
elder Si	/kwi (/kwi)
younger Br or Si	tsī (tsī)

The above terms are used for both full and half siblings. These terms are fixed to the sibling relationship in the sense that no other terms replace them under any condition; but, unlike the parent–child terms which are applied to no other relationship, the sibling terms are under certain circumstances extended to other relationships than that of biological sibling.

The generational terms are as follows:

Applied to males	*Applied to females*
tsu (tsū)	//ga (g//^ha)
/gu/na (/uŋ/^ha)	tūn (txūŋ)
tun/ga w.s. (txuŋ.g/a) alternate to /gu/na	

The terms are reciprocal. If a male ego applies the term *tsu* to a man, he is termed *tsu* by that man. Or, if a male ego terms a woman *//ga*, she terms him *tsu*. It is the same with the */gu/na–tūn* pair.

The above statements are subject to the qualification that, when using these terms, the older person invariably uses a diminutive form for the younger person. We shall list the diminutives here, and then, to avoid being cumbersome, omit them henceforth throughout the text. The diminutive is expressed by adding the suffix *ma*,

[1] The spelling of the Bushman terms used in this paper is an approximation. We represented the Bushman sounds as we heard them as nearly as we could without using symbols except for the clicks. The four clicks are symbolized as follows: dental /, alveolar ≠, alveolar palatal /, and lateral //.

[2] Mr. Ernst Westphal of the School of Oriental and African Studies of the University of London, when he visited our expedition at Gautscha Pan, took down the terms in phonetic symbols as /Kung informants pronounced them. We give his symbols in parentheses the first time the term is given. We wish to express our gratitude to him.

[3] Mr. Westphal spells the term for Mo with a *t* (t^hai), as does Miss Bleek (*tai*). Professor Clement M. Doke, in his outline of the phonetics of the language of the /Kung, *Bantu Studies*, vol. ii (1923–6), pp. 130–65, on p. 150 spells it *?ai*. We feel apologetic about insisting on *dai*, but we thought we heard the voiced sound *d*. We wondered if the *d* derived from *di* which means female and occurs in the term *di/gama* which is applied to persons who have the same name as one's mother (cf. p. 9).

128
194
114

553 7. Names are occasionally changed.
[551] 8. Nicknames are in common use. They are usually descriptive of physical characteristics, such as Gow Umbilicus or Gow Beard.

553 601 It must be kept in mind, as the description of the homonymous method of applying terms proceeds, that the /Kung distinguish between being named for, and having the same name as, a person. When one is named for someone, one is brought into the kinship constellation of that person. Merely fortuitously having the same name as someone does not do this to the same degree. We shall at first limit the description to situations where one is *named for* another.

A child is, as we have said, never named for a parent, nor is a child named for a sibling (though they may have the same name). In these categories of relationship, therefore, the homonymous method of applying terms is not operative. In other categories of relationship, however, when a person is named for another, he is, with respect to ego, terminologically taken out of his biological category and classified in the category of the person for whom he is named. Ego applies a term to him according to his homonymous classification.

There are three categories, with respect to ego, into which persons may be classified by their names. (1) The parent–child category: Although ego is never named for his parent, some of his relatives will be. (Some of his nephews and nieces, for example, would certainly be named for ego's Fa or Mo.) When this occurs, ego applies a term to that person which classifies the person with the parent of ego's for whom he or she was named. The terms are *tsu* applied to males, *||ga* applied to females. The terms *ba* and *dai* are applied, as we have said, only to the biological parents. The terms *tsu* and *||ga* are the terms applied to persons in generations adjacent to ego's (i.e. his parents' generation, cf. Diagram 1, p. 6), and are the terms used to classify persons terminologically in the parent category. The same terms would be used for persons named for ego's offspring who again would be terminologically classified as in adjacent generations with respect to ego. (2) The sibling category: If a person is named for ego's sibling, ego classifies him or her terminologically with that sibling and applies the sibling term, i.e. *!go* (elder Br), *!kwi* (elder Si) or *tsī* (younger Br or younger Si). (3) Ego's category: We consider that the third category is basically ego's category and that it includes persons who are classified by name or generation with ego. Persons may be classified in this category by being named for ego, or for ego's spouse, who is of the same terminological generation as ego. The person for whom ego is named and the spouse of that person are in this category. The way people are classified within it will be brought out as the description proceeds, but more information must first be given about the terms associated with it, namely: *!gu!na* (*tun!ga* w.s.) and *tũn*.

The term *!gu!na*, unlike any of the other terms, so far as we know, is a translateable word. *!Gu*[1] means name, *!na* means big or old. The diminutive which derives from the term is *!guma*, small or young name. As terms *!gu!na* and *!guma* always occur modified with the augmentative or diminutive suffix, never simply as *!gu*, the word for name.

[114 194] [1] This is undoubtedly the word which Miss Bleek heard as *!ku* (cf. 'Bushman Terms of Relationship', p. 62). It seemed to us particularly difficult to determine, when a word began with the alveolar palatal click, whether the consonant release was voiced or unvoiced. We have two opinions here, Miss Bleek's *!ku* and our *!gu*. Mr. Westphal hears no consonant, i.e. *!ũ*.

553 ego or his kin or affines. We shall refer to this aspect of the kinship system as the
601 name-relationship.

Among name-relatives, as among consanguineous relatives, it is the biologically older person who classifies the younger with respect to his (the older's) kinship constellation, using the diminutive form of the term for the younger person. The younger person reciprocates.

551 One of the factors in the name-relationship is an ancestral list of names to which
553 terms are linked. Each /Kung has his own individual list to learn, taught to him by his parents and his *!gu!na*. No one could tell us exactly how the list is compiled, but
601 the theory which lies behind the list is that there were among ego's forbears persons whose names required certain terms. (One surmises they were great-grandparents and their siblings and the siblings of grandparents, &c. or perhaps still earlier generations.) Name-relatives who have these names may have had some distant consanguineous connexions. Ego no longer knows, but the old people knew, and in following their teaching ego knows he is following his proper homonymous pattern. Every informant had such a list and told us what term he linked with every name we knew. Some had more than one term linked with a name. ≠Toma used the term *tũn* for women named Khwova who came from the Gum region and */kwi* for Khwovas from the north. His parents, he said, told him to do this.

553 There is a system of applying terms to name-relatives. Ego is in the place of first
601 priority in the sense that invariably the term *!gu!na* is applied to any name-relative having the same name as himself. Furthermore, ego applies terms to the Fa, Mo, So, Da, sibling and spouse of a *!gu!na* who is a name-relative having the same name as himself, as he does in the case of the person for whom he is named. However, this is carried no further. He does not apply terms to persons named for these name-relatives and he does not apply terms to the nuclear family and spouse of a person he terms *!gu!na* unless the *!gu!na* has the same name as himself.

The term *tsu* is invariably applied to any male name-relative who has the same name as ego's Fa, *||ga* or *di!guma* to any female name-relative with the same name as ego's Mo.

[114 There are gaps in our knowledge at this point; confusion in the data was not re-
551] solved. We think, but are not certain, that next in order comes the ancestral list, taking precedence over siblings, children and spouses as a source of terms to apply to name-relatives. We think the terms applied to name-relatives derive mainly from the ascending generations, except *!gu!na*, applied to persons with the same name as ego's. To illustrate, take a man named Bo. Unless Bo is ego's name, or the name of ego's Fa, ego would use for Bo the term which was linked to the name Bo on his ancestral list. We think that, even if Bo were the name of ego's Br or the Hu of a female ego, the sibling or spouse term would not take precedence over the term linked with the name Bo on the ancestral list. We are certain that the ancestral list does take precedence over ego's children as a source of terms for name-relatives.

We have been assuming that the name occurs on the ancestral list. If a person
[551] should come along whose name was not on his ancestral list, but was the same as one of ego's consanguineous kin or affines, ego would apply the term to that person which he applies to the consanguineous kin or affine. (In the case of an affine ego would use a kin term corresponding to the affinal term, not the affinal

N/OW

LORNA MARSHALL

N/ow[1] is a belief concerning rain and cold which is held by the /Kung Bushmen in the region around Nyae Nyae in South West Africa.

About ten inches of rain falls in an average year in this part of the Kalahari Desert and sinks into the deep sands. There is no run-off in streams and there are few water holes. The rain is sufficient to support a covering vegetation of grass, shrubs, and scrubby trees. The vegetation includes numerous edible roots, tubers, leaves, fruits, and nuts, for which the Afrikaans language provides the convenient word *veldkos*.

The /Kung, the only inhabitants of the interior of this particular region, are nomadic hunters and gatherers. If the rains are poor and the veldkos dry and sparse, the people suffer. Rain, they say, is life-giving; sun is death-giving.

Summer is the season of the 'big rains' in the western Kalahari. 'Little rains'—a few scant showers—may fall in September, October, and November. The 'big rains' begin in late December or January and continue into March. The summer storms are awesome. Every day the winds drive monstrous clouds around the sky, which domes a horizon as flat as the sea. They breed the storms. Lightning streaks from them. Thunder roars and rumbles. The earth sucks in their deluges, hissing.

The /Kung say that thin clouds which give no rain are male. They call them */now*.[2] The big rain clouds are female. White ones they call *//ga kwe disi*—*//ga* means cloud or rain, *disi* means females.[3] The enormous grey clouds with rain pouring from them the /Kung call */kwesi* (zebras), because they are so fleet and, though a person may think he is far from the rain, it comes swiftly and is on him. We have seen Bushmen, caught without shelter in the storms, shivering so that their teeth chattered, saying they could perish in such rain.

Rain itself is male and female, */ga /go* and */ga di*. The men one day drew in the sand the spoor of male and female rain. Male rain spoor was made with all five fingers held stiffly and plunged deeply into the sand, to make big holes. Male rain breaks the trees and beats down the fruits, the men told us. It is (like) a fight, and may kill a person. Thunder and lightning accompany it, and sometimes hail. Female rain has tiny drops and does not spoil anything; it beautifies the trees and the grass and makes the veldkos grow. Its spoor was made by smoothing out a place in the sand and covering it closely with tiny dots. Gao said a person (anyone) may speak to the rain, saying, 'You are doing very well', or, 'Fall silently. Don't make such a noise. Don't be

[1] We wish to thank both Dr. Mary Douglas and Professor I. Schapera for reading the manuscript about *n/ow* and for making several helpful suggestions.

[2] The /Kung language has four clicks: / is the symbol for the dental click, ≠ for the alveolar, / for the alveolar palatal, and // for the lateral.

[3] We did not know how to translate *kwe*, which occurs very oft[illegible]. It seemed sometimes to be a sort of article [illegible] not work on it especially. We regret not having done so because Miss Bleek, in her *Bushman Dictionary* (American Oriental Society, New Haven, Connecticut, 1956), records in the Auen or //K''au-//en language, which she says is very like the /Kung and which she places south of the /Kung, the phrase */ga -k''wisi*, meaning rain's hair or cloud. In /Kung */ga* and *//ga* both mean rain. We now wonder if *kwe* should be *kwi* and if it means hair in the phrase *//ga kwe disi*.

821 171 192 similar to the /Kung word *n/ow* in sound but refers to a different belief. In the /Kung belief, *n/ow* influences rain. The Hottentot concept of */nau* supposes a state of being which exists when people are in periods of crisis in their lives. Professor Schapera[1] says of the state of */nau*, summarizing Mrs. Hoernlé's analysis:

> All periods of crisis in the life of a Hottentot involve his separation from his usual surroundings, his preparation for a new group in society, and, finally, his reception into this group. A person in such a crisis is exposed to danger on every side; he must retire from contact with other people, and take special care of himself. But he is also a danger to other people, and more especially to the animals and other living things upon which the community depends for its livelihood. Hence he is secluded, and must abstain scrupulously from his usual tasks.
>
> Such a person is said to be */nau*. It is essential that he be initiated, as it were, with the least possible delay into that group of his people already possessing the new characteristic he has acquired, in order that he may have a normal place in the community once more.

Remarried persons or persons newly widowed are examples.

171 796 821 Mrs. Hoernlé records a rain ceremony of the Hottentots which has several elements in common with the /Kung belief about *n/ow*. The Hottentot ceremony is called the *guri≠ab* (yearly killing).[2] Professor Schapera's[3] description of the *guri≠ab*, which follows, is, as he says, based mainly on Mrs. Hoernlé's account.

> . . . It [the ceremony] is held, if possible, on the banks of a stream, and if there is no stream near by, then a trench is dug to simulate one. When the old men judge that the summer rains are due (about November or December), they tell the chief that it is time to hold the yearly feast, and he sends word to all the outlying families, and decides the time and spot for the ceremony.
>
> Each family contributes according to its means, all bringing milk, and those who can, some female animal, a cow or a ewe, which must be pregnant. The feast cannot be held at all without one pregnant animal. . . . fires are lit to cook the meat for the feast. In addition a fire is lit on the banks of the stream for the special part of the ceremony. The animals are killed and cut up very carefully, so as to preserve intact the uteri, which are kept till after the feast. Eating apparently goes on most of the time until all the food is finished.
>
> When the fire at the riverside is ready, and a channel has been made to the river or stream, the old men of the tribe who are good at prophesying take the uteri, hold them over the fire and pierce them with sticks so that the uterine fluid flows directly through the fire and down the river. At the same time milk in plenty and fat from the animals are thrown on the fire, so that liquid really flows, and great clouds of smoke rise into the sky. Meanwhile all the people round gather together in a great tribal dance, calling on *Tsui ‖Goab* to send the rain in plenty, to make the ground soft and the grass green, so that they may have plenty of food for the year.

The uterine fluid, the fire and clouds of smoke rising into the sky, and the association of the ceremony with rain are the elements in the Hottentot belief which are similar to the elements in the /Kung Bushman belief of *n/ow*. But, though there are these interesting common elements, the /Kung concept differs largely from the Hottentot *guri≠ab*.

[3] Schapera, op. cit., p. 379.

X137 There were more species of grass, and, particularly on the dunes, more of
136 trees and shrubs. The fauna was also richer for there were buffalo and elephant and many waterfowl in addition to the animals found in the Kalahari.

197 . The Bushman languages represented in this paper are classified
[128] according to Bleek's *Comparative Vocabularies of Bushman Languages* (1929). They are !h3:, the closely interrelated ||ganakwe, |gikwe and Naron, and Auen (see also Bleek, 1928: 60-64).

!h3: is a member of the southern group, in which the lip click is
[194] found, and a dialect of what Bleek calls |nu||en, S6 in her system of classification. Bleek's spelling is !k3:, but I heard the click aspirated. It is spoken in the neighbourhood of Lehututu, which is 150 miles south of Ghanzi.

||ganakwe is spoken to the east of Ghanzi, and has been studied by Maingard (1957).

The centre of the |gikwe language appears to be in the country to the south-east of Ghanzi. It is a member of Bleek's Central group, closely allied to Naron and easily understood by Naron speakers although many
[194] words are different. A curious feature of the phonetics is the occurrence of the ejective lateral explosive followed immediately by the velar glottal affricate (see Cole, 1955: 23 and Beach 1938: 222-223). The first sound is not mentioned in any papers that I have seen on the Bushman languages.

[114] Naron is Bleek's C2. There is an error which is liable to confuse one on page 3 of her publication, where the languages of the Naron and Masarwa of Tati have been transposed. Naron should be under C2 and the Masarwa language under C1. A grammatical sketch of Naron is given in Bleek's paper of 1928.

Auen, Bleek's N1, is the eastern form of the !khû linguistic group and is spoken round Gautscha Pan. It was studied by Maingard when he was a member of this same expedition and an account of it is given in his paper of 1957. In this paper I refer to it as Eastern !khû.

124 The work done in the Kalahari was done through interpreters, and much of that in the northern area likewise, except towards the end of the expedition when through closer contact with the Bushmen for a longer time than in the south, I was able to acquire a smattering of the Eastern !khû language, enough to ask straightforward questions and to understand straightforward replies. The phonetics of the Bushman languages are a study in themselves, and I do not claim that my spellings and indications
104 of the tones are exact. In the orthography I have followed Bleek (1929)
194 with the following exceptions:—

1. I have placed the n first when it is combined with a click. It has been the convention to place the n after the click in the written Khoisan languages, the argument being that the n and the click are pronounced simultaneously (Meinhof, 1909: 5). To my ear the n is the first sound in the combination.
2. Bleek does not mention the voiced h, which sometimes follows a nasalised click. I have accordingly followed Doke (1936: 448) and used the symbol ɦ.

For easy reference, the symbols I have used are listed at the end of this introductory chapter.

As the spellings of the Bushman names on my herbarium specimens are from field notes, they are often different from the spellings given in this paper, which was done after I had had the opportunity of consulting the authors I have mentioned. It will be noticed that many of the plants do not have the full set of Bushman names. The main reason is that we were not in contact with the Eastern !khû speakers until we had passed Ghanzi, and lost contact successively with the |gikwe, ||ganakwe and !h5: speakers as the expedition drew to a close. Other reasons are that my field notes were sometimes inadequate, that I forgot to ask, and that some plants appeared restricted to certain areas and were not known to all the groups of Bushmen. 128 [184]

As the expedition was during the winter when most of the plants were in poor condition, very little photography was done in the field. Most of the photographs are from plants which were sent back to Pretoria and cultivated there, or from plants which grow naturally in the Transvaal. In this paper the plants and photographs are arranged according to de Dalla Torre and Harms (1900-1907). Specimen numbers are in brackets. 126 [128]

There is little doubt that the plants discussed here represent only a fraction of those used, for we covered a very small part of the area over which the Bushmen range, and this when probably most of the annuals were dead, when some foods were out of season and when the above ground parts of many bulbous and tuberous plants had withered and disappeared so that the plants themselves could not be found. 114

Because of poor yield, poor quality, difficulty in harvesting or lack of flavour, not many of the Bushman food plants would be worth cultivating in their present form for the use of civilised people, but they offer a large field to the plant breeder. The most promising have been noted accordingly in the text. 000

There were few bones around the Bushman encampments, but this does not necessarily mean that there is a scarcity of meat in their diet, for the bones might have been removed by porcupines (Alexander, 1956; Dart, 1957) or eaten by hyaenas. A more reliable indication was the scantiness of the Bushmen's skin coverings. There are sharp frosts in the Kalahari and sometimes bitter winds, and one may argue that the Bushmen would provide themselves with sufficient skins if they had a regular supply of meat, although admittedly they eat skins after charring them on the coals and pounding them in a mortar. Vegetable refuse from former meals and fresh vegetable food, however, were found at all the Bushman encampments, and additional gatherings were the permanent chore of the women and children and of the men to a lesser degree. The insanitary condition of the surroundings also provided unmistakable evidence that the bulk of their food was of vegetable origin. 262 [291] [132] [364]

Their knowledge of field botany was astonishingly good. It has to be, otherwise they would have no chance of survival in their arid country. Fragments of stem, dead leaves, and other small clues of this nature, after being unerringly identified, were all the Bushmen needed to find many of the storage organs they were seeking. Differences which escaped me would enable them to distinguish between edible and harmful plants, and they had a thorough knowledge of the areas and habitats in which their food plants grew. They must have an influence on the distribution of plants, 824 137X

137 spreading some like the Grewias and the melons whose seeds pass through the alimentary canal apparently unharmed and reducing others like the Eulophias and Vignas which have edible underground storage organs. It is perhaps significant that, with two exceptions, the edible members of the family Asclepiadaceae were rarely found. In this paper there are 11, from Raphionacme to Fockea inclusive—nearly all important food plants with underground storage organs. The two commoner exceptions were *Sarcostemma viminale* which is sometimes poisonous and *Pentarrhinum insipidum* which has edible leaves and fruits but an inedible perennial root.

146 I am not qualified to speak on the health of the Bushmen, but it is apparent even to the layman that they are very unlikely to suffer from any deficiency disease while on their natural diet. When they are recruited for labour and fed on an unbalanced diet their health will be undermined and they will be less able to resist the rigours of their normal life when their contracts expire.

114 Their study by serious workers is to be encouraged for it should lead to their stability as a race and the enrichment of our knowledge, but contacts with irresponsible strangers is unfortunate and observations like the following by Brown (1954: 130) are valueless and regrettable:—

> "They are wonderful runners. When I chased one with the clanging of a bell he set off at a good bat into the distance, and kept it up until out of sight."

122 During the three months in which the field work was done, the expenses of my transport and keep were met from the funds of the expedition, and this I gratefully acknowledge. Dr. R. A. Dyer, Chief of the Division of Botany, gave me the opportunity of joining the expedition, and all facilities for working up the results of the field work. Most of the determinations were done by my colleagues in the Division of Botany, and of them Miss I. C. Verdoorn, author of *Edible Wild Fruits of the Transvaal*, read through the typescript and gave me valuable advice. Dr. L. E. Codd deserves special thanks for the way he saw to the growing of the considerable quantities of roots, bulbs and seeds sent from the Kalahari. I thank Mr. L. K. Marshall, who led the expedition, and the members of it, for their interest and kindness, also Kernel Ledimo, a fluent speaker of the Eastern !khũ language, who was always ready to translate or to pilot me through its little-known and fascinating grammar and phonetics. My notes on the Bushman languages were kindly checked by Prof. L. F. Maingard, and the ethnological literature was supplied mainly by Dr. N. J. van Warmelo of the Department of Native Affairs. I am indebted to Messrs. Midgeley, Martin and Scholtz of the Bechuanaland Administration for hospitality and for enabling me to see parts of the territory that I should not otherwise have seen. My thanks would not be complete without mention of the Bushmen whose knowledge is the foundation of this paper. The information was seldom reluctantly given—usually cheerfully and with humour, and always with intelligence.

X137 year. They produce an erect and robust plant with bright green leaves and numerous spreading underground rhizomes on which more bulbs are borne a few inches below the surface. Some stolons are produced above ground as well, from among the leaves. They afterwards turn downwards, entering the soil close to the parent plant and thereafter behaving in all respects like the rhizomes. The flowering stalk is three-angled and unjointed, with a cluster of compact, spiky inflorescences at the top, some on slender secondary stalks and some almost sessile. The parent plant is in a sense annual, for both it and the bulb producing it wither at the onset of winter, but the fresh bulbs which have been produced form new plants, and the species is capable of spreading very rapidly by this means. The bulbs are rounded, half an inch in diameter with a sharp point at the top, and covered with several papery brown layers which may be removed to expose a pale nut-like body.

Sedges usually favour damp places, but this species seemed equally at home in seepy areas and well-drained ones, and in the sandy country near Nama Pan it was common nearly everywhere, sometimes scattered among the grasses but more often in patches. Its range is from Cape Town to the Mediterranean, and it occurs in Australia also.

262 The bulbs are edible, and seemed to be a fairly important food of the northern Bushmen. The taste is sweetish and they have a crisp tex-
252 ture and a cloudy, very slightly astringent juice. Light roasting improves
222 the flavour. They are easily gathered by scratching away the top layer of soil, and their presence is often shown by the disturbed soil where they grow, for they are a favourite food with many birds and small animals, which scratch and burrow to find them. According to the *Flora Capensis* the plant "has been for nearly a century cultivated in Europe".

X137 *Hyphaene ventricosa* Kirk (5301).

Eastern !khū Bushman !hani and !heni

This palm is bushy when young, but loses its bushy habit as it matures, forming a long clean stem 40 feet in height with a crown of leaves at the top and often with a slight swelling near the middle. The leaf has a strong woody rhachis up to six feet long, slightly hollowed above and rounded below, with a row of sharp hooked spines at intervals of an inch or so along each margin. At its tip it bears the leafy part which is two feet across and folded like a fan. The fruits, a little smaller than a tennis-ball, are covered with a glossy brown papery skin, and are borne in clusters.

Old an half-decayed fruits were found in the neighbourhood of Nama Pan, presumably where they had been discarded by Bushmen, but the palm trees themselves were not seen in this area. Only one specimen was found, 20 miles to the north-east. It was immature and had neither flowers nor fruits. According to available records, it was growing near the southern limit of its range, which extends to northern Rhodesia and the Belgian Congo.

262 There is a quarter-inch edible mealy layer immediately underlying the
114 skin of the fruit. It is fibrous and dry but sweetish, with a pleasant flavour, and may be gnawed off the hard inner shell into which it merges.
[272] The kernel in the centre of the mature fruit is hard and bony and inedible,
[252] but Chapman (1868:II:73) states that the milk of the young fruit may be used like that of the coconut, and that the whole of the young fruit may be EATEN AFTER BOILING, "PULP, RIND, AND ALL."

be eaten after boiling, "pulp, rind and all". Dinter (1912:21-22) says also that the Bushmen use the heart of the palm as a green vegetable, and that a sweet sap may be tapped from the upper part of the stem and fermented to make an alcoholic drink. He gives the yield of fruits from one palm as between 20 and 50 kilograms (48 to 120 lb.). His reference to the heart of the palm is obscure, but Chapman (1868:I:55-56), who is more explicit, says that this is the core of the young trunk. 262 114 [273]

Aloe rubrolutea Schinz (5135). 137X

Eastern !khû Bushman n|oru

This species was in full bloom in early August, and made a striking show with its spikes of brick-red flowers. The plants formed rosettes of leaves 12 inches across, producing a slender erect five-foot flowering stalk. Among the hundreds of speciments seen there were none arborescent, although elsewhere arborescent forms are common (Reynolds 1950: 328). Those seen at Nama Pan were similar in habit to *Aloe zebrina*.

Aloe rubrolutea was seen only on the rocky outcrops near Nama Pan and Gam, growing in patches of an acre or so, but it has a wide distribution extending from South West Africa through the Bechuanaland Protectorate to the northern Transvaal and Portuguese East Africa.

The flowers are stripped off the flowering stalk and pounded to make a spinach-like vegetable. Although the Bushmen said that they did not eat the leaves, they were tasted raw and boiled and were found to be juicy and not unpleasant, and to have no harmful effects. They would be a good source of water in an emergency. 252 262

Aloe zebrina Bak. (4995). 137X

!hɔ: Bushman..... !ganja
!ganakwe Bushman n||oru
|gikwe Bushman... n||uru
Naron Bushman... n||oru

The plant forms a rosette of rigid dark green leaves which have pale transverse bands and numerous sharp teeth along the margins. It may have a stem 30 centimetres long (Reynolds, 1950: 282), but those seen on the expedition were stemless. The flowering stalks were three or four feet high. The sap in the epidermis of the leaves is greenish-yellow. It oozes out of the vessels fairly quickly if a leaf is cut across, and hardens and changes colour on exposure to the air, becoming brown and glassy. The bulk of the sap, which is in the inner part of the leaf, is colourless and translucent, and does not ooze out if the leaf is cut.

Only one small clump of this Aloe was seen, on deep sand about 80 miles directly south-east of Ghanzi. It is, however, recorded from Angola and South West Africa and across the continent to the east.

The Bushmen stated that the leaves were a good source of water. One of these plants was sent to Pretoria and grew well in cultivation. On being tested, the leaves proved extremely unpleasant, not because of any bad taste but because their sap is in the form of a thick, revolting slime. Boiling or roasting did nothing towards making them more palatable. Either the Bushmen were confusing this Aloe with another species, or it 262 312 824

262 271 824 [114] is eaten only when they are in the greatest need. Reynolds (1950: 285), quoting W. B. Hooker, states that its flowers may be eaten after boiling, but I did not think of asking the Bushmen about this, and they did not volunteer any information.

X137 *Dipcadi* sp. (5163, 5307).

!hɔ: Bushman.....	n!ɓom
Naron Bushman.....	n!ɔm
Eastern !khû Bushman	n!umʃé:

Although the above-ground parts had been killed by frost, enough remained for the plant to be identified as a species of Dipcadi. The bulbs were two inches below the surface of the soil, in appearance like a small onion. They were planted in Pretoria, but although they were still alive two years after being collected, they had failed to produce leaves or flowers up to the time this report was written.

Specimens were collected at Nama Pan, in parkland on sandy soil. As the plant was recognised and named by one of the southern !hɔ: Bushmen who was with us, it probably extends into the Kalahari well south of Ghanzi.

[262] The bulbs are edible after cooking.

Scilla sp. near *Scilla lancifolia* Bak. (5190) Photograph 5.

Eastern !khû Bushman tû

This plant has a rounded two-inch bulb covered with a thick layer of dark brown papery scales. In the summer it produces three or four spreading leaves, usually six inches long but up to 10, and one and a half inches wide at the widest part. They are thin but fleshy, strap-shaped (but in section widely V-shaped near the base), and light green, sometimes faintly mottled with darker green. The inflorescence is four inches long and the flowers small and not conspicuous, with purple stamens and a recurved perianth.

It was common in shallow sand overlying rock near Gautscha Pan and Nama Pan but was not easy to find because the leaves and inflorescences had been frosted, and blown away by the wind by the time the expedition had reached those parts. A number of bulbs collected there produced leaves and flowers in Pretoria the following summer, and it was from these plants that the notes were made.

[252 262] The bulb is edible after roasting but I have not tried it personally.

It would be dangerous to experiment with plants like this if what the Bushmen say is true, for it could be easily confused with another species which has an inedible bulb. The inedible species (No. 5181) is shown in photograph 6 and may be distinguished by its longer bulb and longer leaves (10 inches long and over, and two inches wide at the widest part). They have a translucent fringed margin, are pointed, narrowly V-shaped in section and more numerous, about 12 to a plant. In addition, the

Pollichia campestris Ait. (4963, 5040) Photograph 15. 137/x

A small grey-green bush with much-branched slender soft stems, fairly compact when growing in the open but usually found as a semi-scrambler up to four feet high. The leaves arise in tufts of about three, the tufts being opposite each other and at intervals of anything up to an inch along the stem. They are lanceolate and usually under half an inch long. The plant bears what at first sight appear to be fleshy translucent fruits like small white or yellowish mulberries, but which are actually parts of the flowers.

This is a widespread plant throughout Africa, and was seen at intervals all along the route taken by the expedition.

The fleshy parts of the flowers are edible and sweet, with a queer earthy flavour, and are loosely attached so that they may be easily collected by pulling the stems through the hands. The plant, however, did not appear common enough to be of importance as a food. [262]

Eastern !khû Bushman	zâ

This is a rather variable tree, sometimes with erect branches and sometimes with a spreading crown, usually bearing many thin twigs with much dead wood among them. The bark is sometimes loose, dark and coarsely fissured and sometimes white and flaky. The species was also often seen in the form of a many-stemmed shrub about four feet high. It is evergreen, and did not seem to be at all affected by the heavy frosts that were experienced in the central Kalahari. The leaves arise singly or in bunches of four or five from small knobs on the twigs, and are leathery and about one inch long and a third as wide. Although the flowers are small and inconspicuous as individuals, they are borne in masses towards the tips of the twigs and make quite a show. In the Cape and the Transvaal at least the tree appears to be sporadic in its flowering. The fruits are borne on half-inch jointed stalks, and are half an inch in diameter, pale-skinned and translucent, with several large stones surrounded by a thin, watery pulp.

The tree was scattered evenly throughout the country from Molepolole to Ghanzi and Gautscha Pan, and has been recorded from the Cape Province northwards to the tropics. It occurred singly, occasionally in open communities, but it was never seen to form thickets.

The fruits are eaten by the Bushmen, but they do not make pleasant eating, for the pulp has a rather slimy texture and a sickly-sweet taste. [262]

Sim (1907: 123) refers to a meal which is prepared from the roots by drying and beating them. The resulting meal is then sifted to remove the fibres and may be made into a porridge. There are reports of gastro-intestinal disturbances after the eating of Boscia roots, but the reports have not been confirmed, and Steyn (1934: 561) fed large quantities to a rabbit without ill effects. It is suspected that people are susceptible only when they are not accustomed to this food. The Bushmen were not asked about their use of the roots, and did not volunteer any information. [252] [114 124]

The older trees are often hollow, and form natural reservoirs for rain water which is tapped by the Bushmen. (See Adansonia.) 312 824

7:Story N-5 (1955) 1958 FX10 Bushmen FX10

X137 *Coccinia sessilifolia* (Sond.) Cogn. (5167) Photograph 62.

Eastern !khû Bushman ¯k'!:dwa

A vine with many slender stems and bluish-green sessile leaves, deeply and irregularly lobed but usually less so than those of *Coccinia rehmannii*. The are covered with tiny raised scales on the upper surface, which sometimes show through on the lower surface as dots, and although hairs are present they are nearly all confined to the margins and too small to be seen by the naked eye. The tendrils are produced at the base of the leaves. Male and female flowers are borne on different plants. They are superficially alike, and similar to those of *Coccinia rehmannii*. The fruits are ovoid, three inches long and one in diameter, and are bright red when ripe. The leaves drop during the winter, and the vines also wither and disintegrate, but fresh ones arise in the spring from a perennial tuber weighing up to 25 pounds or so and similar in all respects to the tuber of *Coccinia rehmannii*.

Although the plant has a wide distribution on a variety of soils in the Cape Province, the Orange Free State, the Transvaal, the Bechuanaland Protectorate and South West Africa, it was not seen on the expedition until Nama Pan was reached, where it was growing under the shelter of trees in sand. Two tubers, which happened to be male and female respectively, were sent to Pretoria, and flowers and fruits were produced in the summer of 1955-56.

262 252 Both tuber and fruit are edible. The tuber, which is prepared by roasting or boiling, is fibrous and rather tasteless. The fruits may be eaten raw when ripe, and although sweet are without much flavour. They are best used for food when gathered green and cooked as a vegetable. Their texture is then fairly firm and their flavour like that of Asparagus. [136] An added advantage of using them green is that one avoids the larva of a certain fly which, in Pretoria at any rate, often heavily infests the more mature fruit.

● 114 X137 It is of interest to note that although there is a record in the National Herbarium that birds eat the fruit and that the tubers are dug out and eaten by buck, there is no record of the fact that the plant is eaten by human beings. On the contrary, the information on one specimen is "Fruit is very poisonous to children" and on another "Toxic".

the black sky blazes with stars. In winter the icy wind, pour- 132
ing steadily across the continent from the Antarctic, blows all night long.

There are only three months of rain in the whole year, and 132
these begin in December, ending the hottest season when the 137
air is as tight and dry as a drum skin. Under the rain—which is sometimes torrential, drenching the earth, making rivers down the sides of trees, sometimes an easy land rain that blows into the long grass like a mist—the heat and drought melt away and the grass turns green at the roots. Soon the trees flower, and in the low places the dry dust becomes sucking mud. Towering clouds, miles away, widen the horizon, and all the bushes which stretch in an unchanging expanse over dune after dune now blossom and bear white or red or violet flowers. But the season is short, and the plants bud, flower, and fruit very quickly; in March the drought creeps in, just as the veld fruits ripen and scatter their seeds.

When the rains stop, the open water is the first to dry, 132
making slippery mud and then caked white earth. By June only little soaks of waterholes remain, hidden deep in the earth, covered with long grass. These, which are miles apart, dry up by August, and then travel in the veld is nearly impossible. Because of this, large areas of the Kalahari remain unexplored.

We have crossed this desert three times, my family and I, 114
on three expeditions, which usually numbered between ten and fourteen people and included my father, my mother, my brother, and myself, as well as several other Europeans who were linguists, zoologists, botanists, or archaeologists, sent by universities of the Union of South Africa, England, or the United States, as well as four or five Bantu men—several interpreters, a cook, and a mechanic—who were the staff. We usually traveled in four big trucks and a jeep, and had to carry

9: Thomas T-5 (1951-1955)1959
FX10 Bushmen FX10

114 all our food and water, gasoline, and equipment in supplies to last us for several months. We crossed great drought areas, once crossing four hundred miles of the central desert of Bechuanaland where there was no water at all, and once traveling every day for two weeks into an unmapped part of the desert of South-West Africa, close to the Bechuanaland border, where we found a waterhole and refilled our empty [12] drums. All this was for the purpose of filming and studying the life and customs of the people of the Kalahari, who are called the Bushmen.

142 Bushmen are a naked, hungry people, slight of build and yellow-skinned; the only feature they have in common with their large-boned, darker-skinned neighbors, the Negro or Bantu tribes living at the edges of the Bushmen's territory, is their peppercorn curly hair. Otherwise, Bushmen are very like the Asian peoples, often having Mongolian eyefolds and rather broad, flat faces with almost no noses at all. Because of the dust, perspiration, and the blazing sun, their skins darken to a copper brown, but under their arms where sweat has washed the dust away the yellow skin shows. Bushman babies, in fact, are born pale pink, often with a dark, pigmented area at the base of their spines which Kung Bushmen [826] call "the jar"—because, they say, the mother carries her baby and her water jar together in the pouch of her garment—but which we know as the Mongolian Spot.

Physically, the Bushmen are a handsome people, though short of stature—a man being a few inches over and a woman a few inches under five feet—and a little swaybacked of carriage, which makes their bellies stick out. They are handsome 481 because of the extreme grace in their way of moving, which is 142 strong and deft and lithe; and to watch a Bushman walking or simply picking up something from the ground is like

9: Thomas T-5 (1951-1955)1959
FX10 Bushmen FX10

unmarried son or two, and their daughters' children. Bush- 105
men are polygynous, and a man is allowed by custom to have 621
as many wives as he can afford, depending on how well he [575]
hunts—usually a man can afford only one wife, sometimes two (often a pair of sisters), and once we heard of a man with four wives. For this reason there are often more women than men in a band.

The immediate family, a man, his wife, or wives, and chil- 105
dren, is the only solid social unit; otherwise the small bands 592
are always breaking up and recombining with other small 621
bands as the structures of single families change, through marriages, divorces, deaths, or as the family decides to pay a prolonged visit to a different group of relatives.

Any Bushman will either be related by blood or marriage 105
or will be acquainted with all the other Bushmen in his area 602
but this is as far as Bushmen go in their affinities. They do 609
not recognize as their own people strange Bushmen who speak the same language; in fact, they suspect and fear them as they do any stranger.

We have visited four of the Bushman language groups, two 114
of which we stayed with for long periods of time. In 1951, 131
after a survey expedition to learn where Bushmen could be found, we went into the Nyae Nyae area of South-West Africa, close to the border of Bechuanaland, to look for Kung Bushmen. We found a band living near a waterhole, as it was June, the drought of the year, and we stayed with them for four months. At first only a few Bushmen were there, but as [609
the news spread that we were friendly, more and more peo- 276]
ple came to visit us and receive presents of tobacco and salt, for Bushmen love to smoke but rarely have tobacco, which they get in trade. Also, most of the Bushmen had never seen a European before, none had ever seen a European woman, and they came by dozens to sit together in a cluster

114-131 at a distance to observe my mother and me. By the end of our stay we had become friendly with them, and in 1952 we visited them again. We found them waiting confidently for us, living beside the track our trucks had made, as we had told them that we would come back if we were able, and this time we stayed with them for a year. In August 1955 we returned to them again, but before we did so we spent four months in Bechuanaland. We lived one month with a group of Naron and Kō Bushmen at a place called Okwa (the two groups were mixed together because their territories happen to meet at that place), and almost two months with Gikwe Bushmen in the four-hundred-mile stretch of empty desert between Ghanzi, near the border of South-West Africa, and Molepolole, near the border of the Transvaal. Ghanzi is a small town with a post office and a store, the center of a group of rather extensive European farms. Molepolole is a great Bantu village of the Bakwena (Crocodile) Bechuana people, where a Chuana chieftain lives. The other month we spent traveling to the Gikwe, because they are very remote.

174 Nobody knows where the Bushmen originated, from what racial stocks they came, or when they came to Africa. But here and there throughout southern Africa, in mountain caves and on sheltered rocks, paintings and engravings are found which are known to have been made centuries ago, and are believed to have been made by Bushmen. It is hard to say for certain that Bushmen made the paintings because, to my [531] knowledge, Bushmen do not paint on rocks or in caves now. However, Kung Bushmen do scratch designs on the bark of trees and on their ostrich eggshells. During each expedition I asked Bushmen to paint for me with paints and paper which I provided. Though none of the Bushmen we met had ever

9: Thomas T-5 (1951-1955)1959
FX10 Bushmen FX10

CHAPTER TWO

The Road

AFTER we left Chukudu, a tiny village of Bantu people, the last marked place on the map of Bechuanaland between Molepolole in the east and Ghanzi far in the west, we had no path to follow. We took a course out over the veld set by a Bushman, Gishe, who rode in the jeep at the head of our convoy of four trucks and, remembering the land from his childhood—for he was a Gikwe Bushman—pointed the way.

That was in winter, the last of June 1955, and there were fifteen of us on the expedition, a larger group than we had traveled with before. Besides my father, my mother, my bother John, and myself, there were three South Africans with us, who were Dr. Robert Story, of the Division of Botany in the Department of Agriculture at Pretoria; Theunis Berger, once a health officer of the government of the Bechuanaland Protectorate; and Cass Kruger, a mechanic. There were two other Americans—Daniel Blitz, an expert in sound-recording and photography, and William Donnellan, a doctor. There was also a staff of six African and colored men, who were Philip Hameva, the cook; Ledimo, an interpreter who spoke English, Afrikaans, Herero, Sechuana (his native

9: Thomas T-5 (1951-1955)1959
FX10 Bushmen FX10
Gikwe

114 language), and Kung; Simon, a mechanic's helper; William Camm, also an interpreter who spoke Afrikaans, some English, and Gikwe; and Gishe and Dabe, two Gikwe Bushmen who lived on Theunis's farm.

We were looking for Gikwe Bushmen, as we had heard that there were some who lived in the area. We hoped that if we found some, Gishe or Dabe might discover a relative and enable us to make friends.

133 We traveled for many days, all day long, for, not knowing
137 where the Bushmen were, we hoped to come across some of them somewhere, or find a trace or track that might show us in what direction they had gone. We did not find anyone, though, and we saw nothing but the series of long, broad plains that dipped and tilted ever so little; we would find ourselves down in a wide, shallow bowl of grass, then at the rim of the bowl, where we would see the next plain rolling for miles away. Occasionally we came to an acacia forest, but mostly the country was open grassland with tiny thorn bushes down in the grass to catch us. Because it was June, the beginning of the dry season, there were many veld fires, and although we never came upon any, every day we saw their smoke, gray and misty on the horizon, all around us in a ring.
136 Sometimes we saw a small herd of game running far away from us, raising a little cloud of dust. We saw gemsbok, handsome, large, beige antelope, striped black on their sides, white-bellied, with long, straight horns. We saw gray, tousled wildebeest with curved horns like the horns of cattle. Once we surprised a herd of three eland, a bull and his two wives, which had been eating behind a clump of bushes. They threw up their heads when they saw us, eyes catching the sun and shining pale green like fires. They wheeled, hoofs scraping, and ran, their red bodies swaying, their heads held high

A NOTE ABOUT THE AUTHOR

ELIZABETH MARSHALL THOMAS *was born in Boston, Massachusetts, in 1931. She went to Shady Hill School, Abbott Academy, and then Smith College, from which she transferred to Radcliffe College, where she was graduated in 1954. She accompanied three expeditions that went to South Africa to make anthropological studies and films in 1951, in 1952–3, and in 1955. She won the* Mademoiselle *College Fiction Contest in 1952 with a short story, "The Hill People," which was later reprinted in Martha Foley's* Best American Short Stories of 1953. *She lives in New York City with her husband and daughter.* The Harmless People *is her first book.*

114

[p. 266(A)]

10: Bleek E-5 (no date) 1924
FX10 Bushmen FX10
Naron

Brother and sister are the only relations who are forbidden to marry, and by this, real brother and sister are meant, the children of one father and mother, not cousins. I never heard a title for any cousin, however related, though several were present Cousins sometimes marry, but more often a bride from a distance is procured. 582

A pair of sisters have a very close relationship. They are generally chums, and help each other with their babies. A child calls its mother's sister its "little mother". In speaking of the occasional bigamy found among the **Naron** in contrast to other Bushman tribes, an old man said to me: 593 [601] [604] 595

"A man may take a second wife, if he wishes. If they agree well, they live in one hut; if not, each makes herself a hut. A man had better take his wife's younger sister as his second wife; then they do not quarrel, but live in one hut."

ǁka in **ǁkashe** "maternal aunt" may be derived from **ǁkai** "together". **Ho** used as a verb means "to marry", also "to give birth to children". **Ti kweba** and **ti kwesa** mean simply "my man", "my woman"; they are more often used than **hoba** and **hosha**. 196 601

A widow may marry her late husband's brother, but need not do so. She is quite at liberty to marry any other man. If she remarries, her husband is expected to look after her children; otherwise the duty falls upon their father's brother. The widow may stay near her husband's people, or return to her own people, as she pleases. 587 [604]

Grandparents, particularly on the mother's side, are very fond of adopting a grandchild. They will half adopt one, even during both parents' lifetime. The grandmother is generally the person who teaches a child to speak. 597 603 [868]

In concluding these notes on the tables of relationship, I should like to say that I know they are very incomplete. At the time of my stay among the **ǁkau ǁen** and **Naron** I had not realized the importance of this side of native life; nor apparently had my aunt, Dr. Lloyd, whose work I rely on for the **ǂxam** and **ǃkuŋ** tables. Still, I think sufficient has been collected to show the general trend of Bushman family ties. 114

One must always remember, that people depending on nature for their entire food supply, can only exist in very small, widely scattered groups. Families cannot be large. Drought and famine 105 161

NOTE ON BUSHMAN ORTHOGRAPHY

By D. F. Bleek

IN writing the article on "Bushman Terms of Relationship" appearing in this issue of *Bantu Studies*, I have tried to follow the phonetic script of the International Phonetic Association, as far as I understand it, except for denoting clicks. For these I should be willing to use the symbols chosen by Mr. Doke for Zulu clicks, were they adequate for expressing all the click combinations found in Bushman; but they are not. 104 114 194

Had Mr. Doke seen fit to adopt one symbol for each implosive sound, regardless of the accompanying breathed sound, I could have used these symbols for three of the Bushman clicks. But unfortunately Mr. Doke has not followed that course, but has chosen three symbols for each implosive sound denoting a combination of the implosive sound with the sound made by the expulsion of the breath.

Every click has a double closure, one made by the front or tip of the tongue against the teeth, alveolar, or palate, or of the lips together, the other by the back of the tongue against the velum, as Mr. Doke has shown in his admirable experiments. In making the click alone, only the front closure is audibly released, the back closure might stay in position, for all we know, no breath being emitted from the lungs. We cannot call that click either unvoiced, voiced, or nasal. But in speaking, this implosive sound is accompanied or followed by breathed sounds. The back closure being in the position for "k" or "g", if the air is pressed against that closure while the click is made, it will produce a slight "k" or "g" sound in rushing out. These sound combinations are called by Mr. Doke and others unvoiced and voiced clicks. If the uvula is lowered while making the click, a nasal sound is produced.

For these three combinations Mr. Doke provides symbols. All three are found in Bushman, the first in very many examples; but there are words in which not the slightest "k" or "g" sound is audible with the click, the back release is silent. In others the back release is silent, but an aspirate follows before the vowel. Again, there may be a treble closure: front of tongue, back of

10: Bleek E-5 (no date) 1924
FX10 Bushmen FX10

104 tongue, and glottis. The front of the tongue is released first,
114 making a click, then the back is exploded, making a sort of glottal
194 plosive. The fricative "x" may also be combined with the click. For these clicks or combinations of sound there is no provision in Mr. Doke's system, so to avoid confusion I have followed the old custom of all writers on Bushman and Hottentot, and used a sign for the click alone, expressing the other sounds by their ordinary symbols.

104 This may best be shown by examples. We find the dental or
194 alveolar click in the following combinations:—

Bushman spelling.	English.	Mr. Doke's spelling.	Old Bantu spelling.
ǀa	to fight		
ǀka	to leave	ʒa	ca
ǀkha	stick	ʒha	c'a
ǀha	husband		
ǀxã	to shoot		
ǀk'a	river bed		
ǀga	hippopotamus	ɣa	gca
ǀna	head	ɳa	nca

The retroflex plosive click is found in the following combinations:—

Bushman spelling.	English.	Mr. Doke's spelling.	Old Bantu spelling.
ǃa	along		
ǃkã	to await	ʗa	qa
ǃkhau	bee	ʗhau	q'au
ǃham	first		
ǃxa	sister-in-law's husband		
ǃk'ao	to skin		
ǃgã	frog	ɢa	gqa
ǃna	winter	ɲa	nqa

These combinations can be found with the retroflex fricative click, which corresponds more or less to the lateral click of Bantu. Bushmen do not make this click with the tongue against the teeth or side of the mouth, but place it in about the same position as for the last click, only they release it gently, as in making the dental click. I give as examples:—

10: Bleek E-5 (no date) 1924
FX10 Bushmen FX10

Bushman spelling.	English.	Mr. Doke's spelling.	Old Bantu spelling.
ǁa	to go		
ǁka	wet	ʒa	xa
ǁkhā	lion	ʒha	
ǁhagen	to equal		
ǁxā	again		
ǁk'ą ǀkwi	son's father-in-law		
ǁga	night	ʒwa	gxa
ǁna	there	ǁa	nxa

\ below the line indicates a low intonation.

The same combinations can be found with the alveolar plosive click, which is made as the retroflex plosive click, only with the tongue pressure very far forward, almost on the teeth. For example :—

Bushman spelling.	English.
ǂabbakn	to burn
ǂkā	bare
ǂkhàra	wingfeather
ǂhau	to jump
ǂxamma	to fetch
ǂk'anna	to call
ǂgabbetn	to throw
ǂna	to forget

The fifth click, found only in Southern Bushman, is made by pressing the lips together and then sucking the air in. It is found in the following combinations :—

⊙pwa little, ⊙bu to rain gently, ⊙ho tree, ⊙mwainya to kiss.

In his "Notes on a problem in the mechanism of Zulu clicks", Mr. Doke speaks as if no "k" sound were heard in what he calls the "unvoiced" clicks. I think most people hear a very slight "k". Colonials, in using Zulu or Kafir names, very often omit the click and say the rest of the word as they hear it. They always get a "k" sound, *Cetywayo* becomes **Ketywayo**, *X'osa* becomes **Khosa**, and so forth. I do not know of any Bantu names with clicks that have turned into words beginning with a vowel on the lips of Colonials.

On the other hand Hottentot place names, when adopted by Colonials and stripped of their clicks, sometimes become words

10: Bleek E-5 (no date) 1924
FX10 Bushmen FX10

000 beginning with "k", such as *Kakamas*, *Karakhois*, from ǂkakamas, ǂkarakhois; and sometimes turn into words beginning with a vowel, as *Aus*, *Abiam*, *Oas*, from ǂaus, ǂabiam, ǂoas.

Moreover, by speaking of "unvoiced" clicks, Mr. Doke shows 104 that he is thinking of the expulsion of breath from the lungs, not 114 merely of the implosive phone, the click proper. In spite of my 194 disagreeing with him on this point, I would adopt his symbols, were they adequate for Bushman transcription. As it is, I stick to the old signs long identified with the Hottentot and Bushman clicks, and sufficing for all purposes, rather than inventing a whole row of new symbols.

000 To Dr. Beech I tender hearty thanks for his kind help in explaining the phonetic script of the I.P.A., which would otherwise have remained a closed book to me. I only hope that this attempt at Bushman transcription may be clear to other students.

114

JOHN MARSHALL is one of a family that has been studying the Bushmen for nearly a decade, in expeditions to South West Africa by the Peabody Museum, Harvard University.

222 !Kung women, who are slender-armed and do this monotonous work to the end of their lives. All roots—a major food—are gathered in identical fashion. The implement for this is a digging stick—made usually by a woman's husband from any of a number of hardwoods: the bark is peeled from a branch, a point is whittled sharp. Women, squatting, dig narrow holes in the earth with these sticks, and tug until the root they have reached comes free. Berries are picked—high ones jostled down with sticks and sought for carefully among the grass stems. Nuts are collected on the ground.

[412]

224 SMALL ANIMALS, such as tortoises and even grasshoppers, are sometimes captured by the women and brought home in the evening—such small creatures are also considered *veldkos*. The women, too, will kill snakes, even puff adders. When they see a puff adder, they gather around it in a little crowd, their high laughter tinkling while they drop large, heavy things on its flat head.

222 461 Averaged over a year, women gather on four or five days of each week—the number of days depending

[p. 41]

●114

MR. MARSHALL has participated in all six expeditions to the Kalahari by Harvard's Peabody Museum. Two of the expeditions were in association with the Smithsonian Institution.

224 with the heat and exertion, the portly animals suffer a kind of stroke and have to take to the shade to recover. There, puffing and dizzy, the exhausted elands can be butchered by the deep-breathing hunters.

[223] The trap is a spring-pole snare, of which exists a small version for birds and a larger version for small bucks. Such trapping is usually practiced only by young boys, and even they seem to do it rarely, so that what could amount to an important food source is neglected by the !Kung. The men would rather be gone after the big game, absorbed in the heat and chance of hunting,

SHARING, TALKING, AND GIVING: RELIEF OF SOCIAL TENSIONS AMONG /KUNG BUSHMEN

LORNA MARSHALL

THIS paper describes customs, practised by the /Kung Bushmen in the Nyae Nyae region of South Africa, which help them to avoid situations that are likely to arouse ill will and hostility among individuals within the bands and between bands. Two customs which seem to be especially helpful and which I describe in detail are meat-sharing and gift-giving. I mention also the /Kung habits of talking, aspects of their good manners, their borrowing and lending, and their not stealing.[1] 121

The common human needs for co-operation and companionship are particularly apparent among the Nyae Nyae /Kung. Independent living, outside the band structure,[2] does not exist for individuals. Nuclear families do not live alone. The arduous hunting-gathering life would be impossible without the co-operation and companionship of a larger group. Moreover, in this society the ownership of the resources of food and water is organized through the headmen of bands, and individuals have rights to these resources by being members of a band connected to the headman by some near or remote kin or affinal bond. The /Kung are also extremely dependent emotionally on the sense of belonging and on companionship. Their need to avoid loneliness, I think, is actually visible in the way families cluster together in their werfs and in the way people sit, often touching someone else, shoulder against shoulder, ankle across ankle. Comfort and security for them lie in belonging to their group, free from hostility or rejection. 601 423 622 602 571

Their security and comfort must be achieved side by side with self-interest and much jealous watchfulness. Altruism, kindness, sympathy, or genuine generosity were not qualities which I observed often in their behaviour. However, these qualities were not entirely lacking, especially between parents and offspring, between siblings and between spouses. One mother carried her sick adult daughter on her back for three days in searing summer heat for us to give her medicine. /Naoka carried her lame son, Lame ≠Gao, for years. Gau clucked and fussed over his second wife, Khuan//a, when she was sick. When /U had a baby, her sister, Di/ai, gathered veldkos for her for five days. On the other hand, people do not generally help each other. They laugh when the lame man, Kham, falls down and do not help him up. /U's jealous eyes were like those of a viper when we gave more attention to her husband, ≠Toma, than to her because he was much more ill. And, in the extreme, there is the report from the 1958 expedition of an instance of callous indifference in one band and the probable abandonment of a dying old childless woman, an old aunt, when her sister, with whom she lived, had died. 578 593

Occasions when tempers have got out of control are remembered with awe. The 578 606

[1] This description of the /Kung in the Nyae Nyae region is based on observations made during our several expeditions between 1951 and 1959. Changes in the conditions under which the /Kung live are to be expected, and how these changes will affect the practice of the customs here described we do not know.

[2] Lorna Marshall, '/Kung Bushman Band Organization', *Africa*, vol. xxx, no. 4, Oct. 1960. [114]

12: Marshall E-5 (1951-1959) 1961 FX10 Bushmen FX10
Kung

to the /Kung. It gives one the responsibility of choosing when to eat one's meat and struggling with hunger as best one can when it is finished, without occasion or excuse for blaming others for eating more than their share.

It has often been reported that, when Bushmen kill an animal, they gorge themselves until they can hardly walk. We have seen the Nyae Nyae /Kung eat hearty meals of meat when they have been long without, but nothing more than we considered a normal amount. They hang meat in the bushes to dry and can keep it for some time. It is not uncommon for them to eat quite sparingly and save bits for a coming journey or against a future day of hunger.

The /Kung are quite conscious of the value of meat-sharing and they talk about it, especially about the benefit of the mutual obligation it entails. The idea of sharing is deeply implanted and very successfully imposes its restraints. To keep meat without sharing is one of the things that just is not done.

Gift-giving

The custom of gift-giving comes, in my opinion, second only to meat-sharing in aiding the /Kung to avoid jealousy and ill will and to develop friendly relations. /Kung society puts considerable emphasis on gift-giving. Everything a person has may have been given to him and may be passed on to others in time. The /Kung make their artifacts, on the whole, of durable material and take good care of them. They last for generations and move in a slow eddy among the people. The dealings are only between individuals, but they are numerous and provide occasion, perhaps more than any one other activity does, for visits which bring whole bands into polite encounter.

We gave cowrie shells as parting gifts in 1951 to the women in ≠Toma's band, the band which first sponsored us and with which we stayed and did our consistent work, wherever they were, on each expedition. We had carefully observed that there were no cowrie shells among /Kung ornaments before we gave them. Ours were bought from a New York shell dealer, perhaps to the confusion of future archaeologists. We gave to each woman enough for a short necklace, one large brown shell and twenty smaller grey ones. In 1952 there was hardly a cowrie shell to be found in Band 1. They appeared, not as whole necklaces, but in ones and twos in people's ornaments to the edges of the region.

The /Kung have not developed special objects to use as gifts. Nor have they invested ordinary objects with special gift significance. What they give each other are the common artifacts and materials of everyday life (see Appendix). Some objects are more highly valued than others as gifts, as one would expect. I gathered that relative scarcity of material was a factor and that objects were appreciated for their beauty, workmanship, and appropriate size (a wide headband is better than a narrow one). People took an interest in remembering to whom an object had been given in the recent past, but the /Kung, who are present-oriented, do not place special value upon antiquity as such or systematically hold the distant past in mind.

The /Kung decorate their artifacts very little (they have developed music and dancing, not the plastic or pictorial arts), but they delight in ornaments with which to adorn themselves. The intrinsic beauty, the meaningfulness, and the relief to the monotony of yellow-brown skin and grey-brown leather karosses are all valued.

/KUNG BUSHMAN RELIGIOUS BELIEFS[1]

LORNA MARSHALL

MY purpose in this paper is to describe some of the religious beliefs held currently by the /Kung Bushmen of the interior bands of the Nyae Nyae region of South West Africa. I shall limit the paper to a description of their concepts of the gods, the problem of evil, supplication, the spirits of the dead, and the ceremonial curing dance, but leave for another paper a more detailed account of medicine men, how they become medicine men, and more about their practices and beliefs. We gathered the information which I present principally on our expeditions of 1952–3 and 1955.

Schapera traces considerable borrowing in the past by the Bushmen from Hottentots and Bergdama.[2] I did not have opportunity to trace, to any significant extent, possible present-day borrowing or exchange of ideas, and can only report that contact, and therefore opportunity for exchange, takes place between the interior bands of /Kung in the Nyae Nyae region and the Tswana and Herero on the border of the Bechuanaland Protectorate. The /Kung have contact also, but much less frequently, with Makaukau (Auen) Bushmen to the south and through them to some extent with Naron in the Ghanzi region of the Bechuanaland Protectorate. The /Kung of Nyae Nyae occasionally see /Kung to the north of their region, who in turn see the Okavango and Ovambo tribes. Although the Nyae Nyae /Kung had not enough contact with white people before we came to absorb any Christian ideas directly from them, and no Christian missionary has been in the interior of the region, an influence of Christianity cannot be precluded because the Tswana do have contact with Christianity. Our own highly valued interpreter, Kernel Ledimo, who grew up near the border and spoke Bushman from his childhood, had been educated in an Anglican mission school. Although there has been contact with people who have Christian ideas, I do not recognize with certainty any Christian elements among /Kung beliefs.

One is left to wonder if the change in the concept of the nature of the gods, particularly in that of the great god, which appears when one compares the old tales with current concepts, was brought about entirely by the philosophical and logical powers of the /Kung themselves and by their adjustment to emotional needs, or whether influences from without played some part. I hope that the research of others may throw light on this point.

I should like to mention a few of the well-known Bushman beliefs, recorded in the past, which the present Nyae Nyae /Kung do *not* have and then proceed to a more systematic description of beliefs which they hold at present.

The Nyae Nyae /Kung have various beliefs and lore about the sun and moon, Canopus, the Pleiades, and other stars, and they have the well-known myth of the moon and the hare; but they do not attribute active divinity to the heavenly bodies, which are 'just stars', they say in effect, and we did not find that they either fear

[1] We are grateful for a grant towards the publication of this long article.

[2] I. Schapera, *The Khoisan Peoples of South Africa*, London: Routledge, 1930. Reference is particularly to chapter vii.

776 171 The name *Hishe*, Schapera tells us, is used by the Naron and Auen.[1] He thinks it may be a corruption of *Heitsi Eibib*, a mythical hero of the Hottentots.[2] As this name is not reported for other /Kung groups by Miss Bleek, Vedder, or Lebzelter, it is possible that it has been borrowed by the Nyae Nyae /Kung from the Auen. The Auen (also called Makaukau) live immediately south of the Nyae Nyae region.[3]

The name *Hawe* is reported for Miss Lloyd's /Kung informants from Lake Ngami by Miss Bleek, for the /Kung at Tsumeb by Vedder, and for the eastern Kalahari group by Dornan, but not for the Auen or Naron, who said to Miss Bleek, as Schapera tells us,[4] that 'he [*Hawe*] was the "captain" of the men in the north, the Makoba and others. They also said he was the brother of *Hishe*, while one man called him the "captain" of the white people'.

The name *Kxo* is something of a puzzle. I spelt it this way because I thought I heard both the *k* and the velar fricative sound *x*, as distinct from the name *Ko*.[5] I believe now that what I heard as *Kxo* is the name which Schapera tells us is spelt both *Xu* and *||Khu* by Lebzelter.[6] Lebzelter's account of *Xu* given him by the group he calls the eastern /Kung accords so closely with the Nyae Nyae /Kung's account of *Hishe—Hawe—Kxo* that I feel certain that *Xu* and *Kxo* are conceptually the same being.

The Nyae Nyae /Kung did not have the name (or title) */khuba*, the Hottentot word for 'master', which Schapera tells us the Auen and Naron were beginning to borrow from the Nama when Miss Bleek worked with the Auen at Sandfontein.[7] Nor did they have *Thora* which Dornan heard among Bushmen of the eastern Kalahari.[8] And none of the informants we worked with knew the name *Erob* recorded by Lebzelter among the /Kung in the Oschimpoloveld. Schapera tells us that this name came from the Hebrew *Elohim*, a name used by missionaries among the Nama for 'God'.[9]

776 I shall have more to say about *||Gauwa* and *≠Gaolna* presently. The remaining three names, */Gara*, *Gani ga*, and *≠Gaishi ≠gai*, do not appear in the accounts of Bushman religion which Schapera analysed. I struggled to ascertain that they were names, not terms, titles, or descriptive phrases. So far, my evidence leads me to consider them names, but I could not trace their origin. My informants had no idea

[1] Schapera, op. cit., p. 182.

[2] Ibid., pp. 191, 374.

[3] For the location and extent of the Nyae Nyae region see Lorna Marshall, '/Kung Bushman Bands', *Africa*, vol. xxx, no. 4, Oct. 1960, pp. 325–7.

[104 114]

[4] Schapera, op. cit., p. 183.

[5] Some /Kung informants, /Ti/kay among them, claimed they did not know the name *Ko*. Others told us that *Ko* is a god of other people, a different god, not *≠Gaolna* or *||Gauwa*. They said, for example, that the white man's god is *Ko*. One informant said, in effect, that, even though *Ko* was a god of other people, he could kill anybody—white men, black men, and Bushmen. One is interested to note that *Ko* was the name of the female mantis god of the Bushmen of Basutoland, reported by Arbousset, as Schapera tells us (ibid., p. 181).

[6] 'Lebzelter, in his account of Kung religion, says that all the groups investigated by him have the belief in a "supreme good being" ("ein höchstes gutes Wesen"). Among the Eastern Kung this being is termed *Xu* (elsewhere he spells the name *||Khu*) or *Xuwa*, "the Lord" or "the great captain", whom he identifies with Vedder's *Hawa* or *Ha'o*.' (Ibid., p. 183.)

Bushman languages present so many difficulties to those who are not experts in them—difficulties in recognizing the clicks and in sorting out variations in pronunciation between individuals even of the same group, as well as variations that are probably imposed by the position of the words in the sentence and by other grammatical configurations, &c.—that such discrepancies as *Kxo*, *Xu*, and *||Khu* are relatively slight. Fully aware of my own inadequacy in the language, I usually assume when I differ from another observer that the other is right and I am wrong. However, I cannot simply adopt another's rendering of the word without knowing if the discrepancy is due to dialectal differences or to my ignorance or what, and so must stick to my own approximations.

[9] Ibid., p. 190.

13: Marshall E-5 (1952-1955) 1962 FX10 Bushmen FX10
Kung

et la famine. Tous les deux expriment leur contentement ou leur mécontentement avec les gens, suivant leurs caprices.

Le grand dieu est omnipotent et a le pouvoir de commander chaque action des hommes, des animaux et des éléments. Le petit dieu est censé lui obéir et exécuter ses ordres.

En dernière analyse, le grand dieu est fondamentalement responsable, mais le petit dieu est capable d'une action indépendante et parfois il favorise une personne avec laquelle le grand dieu est mécontent, et, ainsi, fâche le grand dieu qui peut punir cette personne même de mort. Mais les /Kung disent que le grand dieu n'est jamais trop mécontent, car autrement il ne resterait personne vivant sur la terre. Ils adressent des prières sans formalités aux deux dieux en tant qu'individus, notamment au grand dieu, et sollicitent leur bienveillance.

Les /Kung croient que lorsque les gens meurent ils deviennent des esprits, *//gumasi*, qui sont emportés au ciel où ils vivent avec le grand dieu. Il leur accorde l'immortalité et ils deviennent ses serviteurs, lesquels transmettent ses faveurs ou l'infortune aux hommes.

La seule manifestation religieuse à laquelle le peuple se livre de concert est la danse cérémoniale de guérison. Le grand dieu a donné une forte médecine curative qui réside dans la musique de la danse et dans les corps des guérisseurs. Au cours de la danse, cette médecine est évoquée non seulement afin de guérir quelqu'un qui est effectivement malade, mais également dans le but de chasser le mal éventuel et de protéger les gens. Les /Kung expliquent le fait que parfois la médecine ne guérit pas en disant que le grand dieu permet à la médecine d'agir ou non, suivant sa volonté.

PREFACE

The Bushmen of Southern Africa are today represented by scattered groups of hunters on the plains of the Kalahari and on the farms of South West Africa and Angola. They are a unique and mysterious people and have attracted the attention of numerous writers since the early settlers at the Cape first made contact with the Sonquas. In this Bibliography an attempt has been made to list most aspects of the culture of the Bushmen. A bibliography on rock art was compiled in 1947, thus only a few items appear on this subject. Those included are of interest because they suggest some facet of culture or culture history. Some items are predominently of a physical anthropological nature but contain sufficient ethnological information to justify their inclusion.

The items are arranged in alphabetical order under broad subject headings and an Author-Title index has been provided. The section entitled History, was included because it was felt that the earliest references to Bushmen at the Cape and later in the interior, are of interest, in creating a picture of the life and customs of the extinct groups of Bushmen. The history of the tragic clashes between the Bushmen and other races which led to their extinction in most of Southern Africa, is traced in such historical works as J. Sutherland, Memoir respecting the Kaffirs Hottentots and Bosjemans of South Africa and Donald Moodie, The Record

The main body of the bibliography is devoted to the ethnology of the Bushmen and here are included items by authors, some of whom are not ethnologists but whose work is of sufficient value to allow its inclusion in this section. The items included in the small section entitled Bushman Folklore, include popularised versions of the work of Dorothea Bleek and Lucy C. Lloyd. The section on Linguistics is purely restricted to works available in Johannesburg and no attempt has been made to obtain works by the Portuguese students of the Bushmen or other foreign linguistic studies. This can therefore claim to be no more than a token coverage of a field, in which a vast amount of work has been and still is, being done. The section entitled General, contains work not sufficiently scientific to be included under Ethnology, yet of interest, often because of their excellent illustrations. This section begins with works published after 1900 and works of a similar nature published before this date, appear in History.

Sources. Mendelssohn, South African Bibliography provided some of the older items. Many of the older periodical references were traced through the bibliography in - I. Schapera, Khoisan Peoples of South Africa and the Johannesburg Public Library's Index to South African Periodicals was also used. A list of periodical abbreviations indicates the sources consulted. Periodical titles were written out in full when they appeared only once.

Brief annotations are given in some cases. Page references and an indication of contents, have been provided for some of the older items which do not contain an index.

My sincere thanks are due to Prof. L.F. Maingard, Prof. M.G. Marwick, and Mr. G. B. Silberbauer for their valuable advice, to Prof. Manuel Guerreiro for kindly sending material on the Portuguese contribution to Bushman Studies, of which I could include only a very small number, and to Prof. P.V. Tobias for so kinily allowing me access to his bibliography on cards in the Anatomy Department.

/2/ Marshall shows how specific customs reflect the dominant quest for water, and she portrays the feeling of Bushman culture as well as providing an ethnologist's construct. In this configurational model focusing on ethos, she indicates how derived themes or postulates, such /7/ as the stress on cooperation, relate to the most basic theme. Comparison of the !Kung Bushmen with the Mbuti Pygmies, the other foraging group represented in this book, reveals that even though these groups occupy very different habitats some features of their cultures are similar. These include not only elements of technology, for example, the use of poisoned arrows, but themes such as the stress on cooperation and the minimizing of intragroup conflicts, features that are a functional requisite for the close, face-to-face relationships in a foraging /2/ band. Thus a study of the Bushmen offers insight into what may be minimal and hence universal features of the foraging band as a culture type.

Bushman culture is also of interest to those concerned with African culture history, for archaeological remains of societies with a similar material culture have been discovered scattered over a much wider region of the eastern part of the continent than the Bushmen now occupy. Many anthropologists feel that the bearers of these early cultures were Bushmen, or Bushmanlike in racial type. An understanding of Bushman culture gives us insight into the cultural and behavioral setting to which the mute artifacts may have belonged.

about the author

/14 [10] Lorna Marshall lives in Cambridge, Massachusetts, and, with members of her family, has conducted several expeditions to the Bushmen of the Nyae Nyae region of South West Africa (1951, 1952–1953, 1955, 1959, 1961), of Bechuanaland Protectorate (1955, 1961), and of southeast Angola (1959). She received her M.A. from Radcliffe College in 1928. Her writings include "The Kin Terminology System of the !Kung Bushmen" (1957), "N!ow" (1957), "Marriage among the !Kung Bushmen" (1959), "!Kung Bushman Bands" (1960), "Sharing, Talking and Giving: Relief of Social Tensions among !Kung Bushmen" (1961), and "!Kung Bushman Religious Beliefs" (1962).

guages, some now virtually extinct, were characterized by a fifth click made 194
with the lips, called the kiss click (⊙). In addition to clicks, the Bushman 197
languages have tones: high, middle, low, rising, and falling. Oswin Köhler [114]
has given special attention to tone as well as to other features in his study
of Bushman languages, especially Barakwenga (Köhler 1962).

Each of the large divisions of the Bushman languages—the northern, 197
central, and southern divisions (see Bleek 1956)—differs markedly from the
others. Within each group are several languages, sometimes resembling each
other enough to be considered merely dialects of the same language, but
more often differing so widely as to be distinct, mutually quite unintelligible
languages. The !Kung described in this chapter (Köhler's and Westphal's
!Xû) belong to the northern group.

HABITAT • The Kalahari Desert, some 1200 miles long, with a mean high 133
altitude of about 3000 feet, forms part of the great plateau of southern
Africa. It is a basin in form, covered with wind-blown sands, sometimes red, [134]
sometimes white, to a depth of 300 to 400 feet. The underlying rock crops
out rarely in ridges and a few low hills.

Stamp (1953:78) classifies the Kalahari as a semidesert. Its conditions 132
are not the most extreme. Our expeditions recorded daytime air temperatures
in the shade up to 115° F. and sand temperatures in the sun up to 140° F. In
winter the temperature at night falls below freezing but for most of the year
the nights are temperate. Although they seem acclimated to the heat, the [147]
Bushmen appear to find the colder temperatures very uncomfortable and
shiver violently if they are away from their fires when the cold south winds
blow.[5]

The rainfall, which comes in summer thunderstorms—6 to 10 inches, in- 137
creasing in the better-watered parts toward the north, according to Welling- [132]
ton (1955:61)—though slight, is sufficient to sustain a varied drought-
resistant vegetation, and the country is covered with grass, brush, and scant
small trees. In the northern and northwestern parts, the trees are more [824]
numerous and taller and include shivi groves and nut-bearing mangetti—
important sources of food to the Bushmen. And in all the areas of the desert
that Bushmen inhabit are found edible plants, in scant, far-apart patches per-
haps, but existing. The vegetation, furthermore, provides material for fires, 824
shelter, weapons, implements, tanning, poison for arrows, and juices (for ex-
ample tsama melons, on which these people can live when there is no water).
In short, this desert provides the things that make life possible; otherwise
the Bushmen would be dead or somewhere else.

The desert is a forceful shaper of the outlines of Bushman culture, and 182
both the possibilities it permits and the limitations it imposes have been mean- [114]
ingfully summarized by Robert Story in a personal communication:

15: Marshall E-5 (1951-1961) 1965
FX10 Bushmen FX10
!Kung

drama, of releasing the emotions of the people and purging them, in the Aristotelian sense. Fear and hostility find an outlet and the people have acted together to protect themselves. In this there are support and solace and hope.

CHANGE

Today (1962) the pattern of life for the Nyae Nyae !Kung has begun to change radically. Many Bushmen of other language groups have had prolonged contact with the Bantu peoples among whom they live, and some have worked on Europeans' farms. Systematic studies of their social changes are lacking. The Nyae Nyae !Kung, as described here, had contact with Herero and Tswana neighbors in trade, but this contact did not appear to change the social structure of the independent !Kung. They are only now beginning to feel the impact of European contact. They were remote; they are no longer so. When, in 1951, we first worked our way to their area from the outposts of the farm lands, we were eight arduous days en route, in trackless, waterless country of bush and heavy sand, our four trucks heavy with water and petrol, equipment and supplies. Today a well-cleared track gives access in a day. Farmers began to come into the area to get the Bushmen to work for them and have their eyes upon the land.

The government of South West Africa, realizing the problem of the Bushmen, has appointed one of their most competent administrators of native affairs to be Bushman Affairs Commissioner, and is supplying him with funds and equipment. He and his wife are in the Nyae Nyae area and are working with several families of !Kung. He is leading one group of them into agriculture and this year they harvested a crop of corn. Others of the men are employed in road building and are being paid a cash wage, currently a shilling a day. It is too early to say what will happen to their social forms in so radical a change, which ones they will lose entirely, which they will retain and adapt to new conditions. All we know is that the !Kung who are taking part in the experiment have expressed themselves as willing and anxious to try to develop a new way of life.

NOTES

(1) Some of the ethnographic material used here has been previously published in my articles in *Africa* which are cited in the bibliography appended to this chapter. The ethnographic material is used with the permission of the International African Institute and the editor of *Africa*.

(2) Skeletal remains of Bushmen are found associated with late stone age implements in South Africa, but not with early or middle stone age (Schapera

174 [172] 1951:26). In East Africa are sites indicating that people of common origin with Bushmen inhabited those regions, and this suggests that Bushmen in past ages migrated from the northeast (Schapera 1951:27) into South Africa, where they distributed themselves from the Zambesi River to the Cape of Good Hope. Hottentots also came into southern Africa—from East Africa in all probability—bringing with them herds of cattle. Bantu-speaking Negro tribes migrated into southern Africa, it is believed during the fourteenth and fifteenth centuries. White settlers began in 1652 to establish themselves at 177 the Cape of Good Hope. Negroes, Hottentots, and whites encroached upon Bushmen, who were expelled from the better-watered lands or assimilated or 131 exterminated. With the exception of a few individuals, the surviving Bushmen are found now only in the Kalahari Desert.

131 (3) The numbers of Bushmen found in various political divisions in 1955 as 162 listed by Tobias (1956) are as follows:

Bechuanaland Protectorate	31,000
South West Africa	20,311
Angola	4,000
Northern Rhodesia	200
Union of South Africa	20

144 (4) Hooton classified Bushmen and Hottentots as a composite race, predominantly Negroid (1946:628) "whose racial ambiguity will probably continue to haunt us" (p. 633). [Cf. Schapera (1951:27), who says that it is generally regarded that Pygmies and Bushmen probably both diverged from a small variety of Negro; and Tobias (1961:19) who points out that no fossil remains have yet been found to provide definite evidence of this.] The resemblance of some of the physical characteristics of Bushmen to those of Mongolians is generally thought to be fortuitous (cf. Tobias 1957:4 ff.). Coon (1962:193) places the Bushmen among "tag-ends of ancient humanity, culturally as well as physically archaic," hard for classifiers to "fit into cate- [114] gories, let alone explain." The reader is referred to Schapera (1951) and Howells (1959) for judicious presentations of what is and is not known about these peoples.

114 147 (5) Studies on the adaptation of the Bushmen to heat and cold have been published by Wyndham and Morrison (1956).

224 126 (6) The nature of the Bushman hunt is graphically and empathetically portrayed in a most effective and widely acclaimed film, "The Hunters," made by Mrs. Marshall's son, John Marshall, while following !Kung hunters. Information about purchase or rental of the 70-minute film may be obtained from The Film Study Center, Peabody Museum of Archaeology and Ethnology, Harvard University, Cambridge 38, Mass.—Ed.

553 602 121 (7) I think that in the name relationship of the !Kung we can see the potential beginnings of a kin group. It would seem that it could be a *deme* if it existed. A deme is a name Murdock proposed for a bilateral endogamous local group, in the absence of unilinear descent, "comparable to the sib both in size and in the traditional rather than demonstrable bonds of kinship which unite

PREFACE

[p. i]

114 The Bushmen of southern Africa have long held a fascination for anthropologists because of their unusual language, culture and physical type. Physical anthropologists have been intrigued by the apparently unique morphological adaptations of the Bushmen (such as steatopygia and the tablier) and the problem of the racial status of the Bushmen (Broom 1941, Coon 1955, 1962, Dart 1937, DeVilliers 1961, Tobias 1961, 1964). Linguists have focussed attention on the unique click languages of the Bushmen (W.H.I. Bleek and Lloyd 1911, D.F. Bleek 1929, 1956, Vedder 1910-11, Maingard 1957, Westphal 1963).

It is curious, in light of this interest, that, until recent years, professional investigations of Bushman sociology and ecology have been conspicuously lacking in the literature. In 1930, Schapera summarized the information then available on Bushmen. His sources consisted mainly of the accounts of early travellers such as Barrow (1801-04), Burchell (1822-24), Baines (1864), and Chapman (1868), as well as the reports of administrators in the German South West African government such as Werner (1906), Seiner (1913), and Passarge (1905, 1907).

With the exception of Bleek's monograph on the Nharo (1928b), which discussed social organization, all of Schapera's

114 sources consisted of fragments of information or were based on the memory ethnography of highly acculturated Bushmen. J.H. Wilhelm's account of !Kung social structure is perhaps the best of the early research, but this study, written in 1917, was not published until 1953 and therefore was not available to Schapera. In spite of the works of Bleek (1928b) and Wilhelm (1953), our information on the social organization and economy of Bushmen at the turn of the century is extremely sparse. Thus the students of Bushman culture have had no baseline study available to them such as the classic researches of Spencer and Gillen (1899, 1904, etc.) on the Australian aborigines.

Schapera's task in his classic, "The Khoisan Peoples of South Africa" (1930), was to salvage the ethnographic facts of a dying way of life. The tone of his book is set by the statement: "There seems little doubt that the Bushmen are steadily dying out as a race. What relentless persecution at the hands of other peoples has not achieved is being slowly accomplished by disease and racial intermixture. Racially pure Bushmen are already in a minority and their ultimate absorption by their neighbors is probably inevitable." (1930:40).

This point of view prevailed for the twenty years following the publication of "The Khoisan Peoples" and was

114 manifested by a virtual absence of sociological research among the Bushmen during the 1930's and 40's.

It was not until the 1950's that it became apparent that Schapera's obituary on the Bushmen was premature. We owe this realization to the recent research and writing of Mr. and Mrs. Laurence K. Marshall and Professor Phillip V. Tobias. The Marshalls began their investigations of Bushman life in 1951.
[161] In the interior of the northwestern Kalahari they found over 1,000 Bushmen organized into hunting and gathering bands. This was, and is, a full-scale viable way of life of a type that was believed no longer to exist. Professor Tobias, after visiting the Kalahari with the Panhard-Capricorn Expedition of 1950, was led to believe that the numbers of surviving Bushmen had
[161] been vastly underestimated. His subsequent research (1956, 1957) showed that there were over 50,000 living Bushmen and that thousands of the Bushmen were living as hunter-gatherers.
[121]. Due to the stimulus of the Marshalls and Tobias, anthropologists realized that excellent research opportunities among the Bushmen had been overlooked, simply because of the mistaken notion that the hunting and gathering way of life had ceased to
121 exist. Thus in recent years the style of Bushman research has been transformed from a salvage operation to the study of viable ongoing social and economic systems; and with the acquisition of new data has come a basic reorientation of our

121 view of the Bushmen. The present study is a contribution to this reorientation and, as such, has implications, not only for Bushman studies, but for the study of hunters and gatherers in general.

The study of subsistence ecology focusses attention on those aspects of the man/environment relation which pertain to the getting of food. Since there are populations of Bushmen available which still maintain a full-time, year-round, hunting and gathering way of life, an investigation of subsistence ecology can be founded on a firm empirical basis. The investigator does not have to rely on the memory of informants concerning conditions no longer in existence.

121 Another recent study - of the subsistence activities of
• 114 Australian aborigines in Arnhem Land (McCarthy and McArthur 1960)
171 - offers an instructive contrast to the present study. Both studies are concerned with the subsistence ecology of hunter-gatherers. The difference lies in the fact that the Australian groups studied spent the greater part of each year living on mission stations where they ate European foods. Consequently, the Australian scientists could observe traditional food getting for two week periods that were bracketed by periods of residence on the mission stations. The Bushman study, on the other hand, is a continuous record of hunting and gathering
121 activities extending over a fifteen month period. The Dobe area
222 Bushmen were hunting and gathering for the simple reason that

ACKNOWLEDGEMENTS

122 It is a great pleasure to be able to thank at least some of the people and institutions who have made possible this study of the Kalahari Bushmen. The research was supported by a grant from the National Science Foundation to Dr. Irven Devore for "Studies in the Evolution of Human Behavior". This grant was administered by Harvard University. [114] The government of the Bechuanaland Protectorate was kind enough to issue a research permit to Dr. Devore and me for the period 1963-65. The Directors of the Livingstone Museum[1], Livingstone Zambia allowed us to use the museum as a base of operations during the study period, and graciously placed the clerical and research facilities of the museum at our disposal.

000 I am grateful for the initial encouragement and continuing guidance of my undergraduate and graduate teachers, particularly Professors Ronald Cohen[2], Robert C. Dailey, and J. Norman Emerson at the University of Toronto; and Professors Sherwood L. Washburn and J. Desmond Clark at the University of California, Berkeley.

---

1. formerly the Rhodes-Livingstone Museum.
2. at present at Northwestern University, Evanston, Ill.

121 (George Silberbauer) was already conducting research among the Bushmen of the Central Kalahari Game Reserve.

After DeVore's return to Harvard in September, the author surveyed the Ngamiland situation and found that the Bushman population in the northwestern sector satisfied our research requirements.

161 312 621 224 222 648 In October, 1963, there were about 430 Bushmen living at nine waterholes in the !Kangwa administrative district. Over 70% of these people were organized into bands and depended on hunting and gathering for their subsistence. Although some 340 Bantu lived in the district they had not established a lord-client relationship over the Bushmen. This feudal type of social system exists elsewhere in the Kalahari but not in 114 the !Kangwa district. The author was the first white person to live in the district. The Marshall expeditions had touched the western edge of the district but had centered their research at /Gautscha, a camp about 40 miles west of our area.

The main field station was set up at Dobe, a small waterhole in Bechuanaland, two miles east of the Bechuanaland - South West Africa border. The author conducted research here for twelve months, except for intervals of work elsewhere in the Kalahari and study periods in Livingstone, Johannesburg, Windhoek and Capetown.

In October, 1964, Irven and Nancy DeVore joined the author

I. INTRODUCTION

121 This dissertation is a report on the results of a field
• 114 investigation of Kalahari Bushmen in 1963-64. The research
122 was supported by a grant from the National Science Foundation
121 entitled: Studies in the Evolution of Human Behavior. The section of the research proposal devoted to Bushmen outlined five major areas of investigation:

1. Census
2. Demography
3. Subsistence
4. Social organization
5. Settlement patterns

The data obtained in the areas of census and subsistence are presented here. Further data on demography, social organization and settlement patterns are summarized here and will be expanded in subsequent publications.

The Bushman research project was conceived to answer a need on the part of archeologists and other students of human evolution for accurate, quantitative information on the subsistence and society of a contemporary hunting and gathering people. It was hoped that such a study would generate new insights on cultural evolution and aid in the task of interpreting archeological materials. The primary task was to define the properties of a hunting and gathering way of life.

121 This statement was then to be employed as a basis for comparison with other living hunting and gathering societies and the generalizations so derived were to be used as a baseline for the reconstruction of the properties of societies and economies of earlier populations of man.

Of the three stages in this research scheme, description, comparison and reconstruction, only the first stage is presented in this dissertation viz the description of the subsistence of one hunting and gathering people.

The Kalahari Bushman study began in August 1963, when Irven DeVore and the author made a reconnaissance of the northern Kalahari Desert to look for a suitable study site. The research goals required a population as isolated and traditionally oriented as possible. Three locations were considered (see Map 1).

1. The Bushman Native Reserve, South West Africa
2. The Central Kalahari Game Reserve, Bechuanaland
3. Northwestern Ngamiland

[114] South West Africa proved to be out of the question. For political reasons foreign scientists are not being permitted to work among the indigenous peoples. The British colonial government of Bechuanaland, on the other hand, has encouraged social scientists from abroad to come and work among the tribes. Our decision to work in northwestern Ngamiland was dictated by the fact that a government-appointed anthropologist

1965		
early January	Dobe-Maun	small rains

114 and we worked jointly at Dobe until the study terminated on January 8, 1965. The study dates and places are summarized in Table 1.

A note on orthography

197 The linguistic status of the !Kung Bushmen will be dis-
194 cussed in Chapter II. As there is still no general agreement among linguists on the phonemes of the !Kung language, a brief list of phonemes is offered here to facilitate the pronounciation of Bushman words used in the text.[1]

Vowels

1. i - as in English "fit, feet"
2. e - as in English "fate, fed"
3. ə - as in English "the, but"
4. u - as in English "book, boor"
5. o - as in English "bore, ball"
6. a - as in English "bat, bar"

Dipthongs

7. au - as in "cow, now, thou"
8. ai - as in "by, sky, bite"
9. ei - close to "bay, bait"
10. iu - no English equivalent; falls between "see" and "Sue"

---

[1] A phonemic analysis of !Kung is in preparation and will be presented elsewhere. The present listing is oversimplified.

II. THE PRESENT STATUS OF THE BUSHMEN

Defining Bushmen

101 Bushmen may be defined racially, linguistically or culturally. None of these criteria used alone will give a 142 satisfactory definition. If the presence of "Bush" physical 144 type is used as the criterion of Bushman status, then some members of Hottentot tribes would be incorrectly included, and members of the hybridized Bushmen peoples of Ngamiland 197 would be excluded. Similarly the presence of a click non- 121 Bantu language would include not only Hottentots again, but also the Hottentot speaking negroid Bergdama of South West 224 Africa, and the Hadza-Sandawe peoples of Tanganyika. A 222 strictly economic criterion, such as the presence of a hunting 461 648 and gathering way of life would arbitrarily exclude the many 241 thousands of Bushmen who are working on European Farms or 233 practicing agriculture and pastoralism.

• 114 A further complication in defining Bushmen is offered by 197 the recent work of Westphal (1962a,1962b,1963). He has demonstrated that the so-called Central Group of Bushman languages of Bleek (1929) are in fact closely related to Hottentot.

101 In this paper a simple ethnic definition of Bushmen is [114] adopted, following the lead of Joyce (1939) and Tobias (1956). Throughout Bechuanaland, the Tswana word "sarwa" is applied to

101 non-Bantu, click-speaking peoples with a tradition of hunting and gathering in their recent past. Thus we may define Bushmen as members of tribes who are acknowledged to be "sarwa" by themselves and others. The term "sarwa" thus includes peoples of varying physical type and economy, and of four distinct linguistic stocks within the click family of languages. The one characteristic common to them all is the tradition of hunting and gathering. The economic and linguistic divisions will be elaborated below.

Numbers and distribution

161 The Bushmen are numerically stronger than has been
• 114 generally supposed. Estimates such as Schapera's 7,000-7,500 (1930), Keith's 6,000 (1948), and Coon's "few hundred" (1955) are far too low. Despite Tobias' careful estimate of 55,000 living Bushmen (1957), the older misconceptions still persist. As recently as 1963, Bohannan estimated the numbers of living Bushmen in the hundreds (Bohannan 1963:213).

161 The author's estimate, based on data available in 1964,
127 shows a total figure rather smaller than that of Tobias' 55,000. It is estimated that there are about 44,100 Bushmen alive today. This figure is based on published sources and unofficial government estimates for Bechuanaland. For South West Africa, the figures are adapted from the Odendaal Commission Report (Republic of South Africa, 1964). For Angola,

Languages

197
• 114 Due to the recent work of Westphal (1962a,1962b,1963), the classification and geography of the click languages has been put on a firmer footing. The author's observations confirm Westphal's scheme in its essentials, but differ on certain details.

197 Among the peoples called Sarwa there are two major linguistic subdivisions:

1. A group of genetically related languages which collectively and individually are related to the Nama and Korana dialects of Hottentot. These languages are called by Westphal Tshu-khwe and were formerly known as the Central group of Bushmen languages.

2. Three languages which are distinct from the Hottentot-related group and distinct from one another. These Westphal calls "Bush A, B, and C." Bush A used to be known as Northern Bushman, Bush B and C as Southern Bushman.

The distribution of these languages is plotted on Map 3, p. 16.

Tshu-khwe - Five related languages are distinguished here. It appears that adjacent dialects are mutually intelligible, but speakers of languages that are geographically separated cannot understand each other.

The five languages are:

XŨ - known as Kwengo in Barotseland, Hukwe in the Eastern

[TEXT CONTINUED ON PAGE 17]

197

Caprivi, and Bukakwe in the Western Caprivi; also found in southeastern Angola.

Shua - the major click language of the Panda-ma-tenga area; also includes Danisin and other dialects of the Mababe area.

//gabake - Hiechware and Ganade are included here; spoken at Panda-ma-tenga, Nata and possibly in the Wankie area; very closely related to Shua.

Deti - the language of the Tete or Tletle people who live along the Botlete River; not mutually intelligible with //gabake although they are genetically related.

Nharo - the main click language spoken on the Ghanzi Farms; there are several important related dialects: N/hai, spoken in the Lake Ngami area,[1] //gana of Central Bechuanaland, and /Gwi of the Central Kalahari Game Reserve.

197 • 114 For a more complete catalogue of dialects, the reader is referred to Westphal (1963:248ff). His use of the term Hottentot to apply to the above peoples who are ethnically Bushmen is unfortunate, since he has not demonstrated that the Tshu-khwe peoples are, in fact, derived from the Hottentot. It is more likely that both are derived from a common

---

[1] Westphal considers this as a separate language. I found it to be only a dialect of Nharo.

197 [114] proto-Hottentot, proto-Bushman ancestor.

Bush - Unlike the five Tshu-khwe languages, the three Bush languages cannot, on the basis of accepted linguistic procedures, be shown to be genetically related. The author, in an attempt to replicate Westphal's vocabulary comparisons, made a lexicostatistic trial on two languages: Bush A (!Kung), and Nharo (a Tshu-khwe language). The percentage of cognates was 11.5% but no rules of regularized sound shifts could be demonstrated between the two languages. Therefore the possibility is strong that the incidence of cognates is fortuitous or due to borrowing. The same low order of cognation was found when Bush A was lexicostatistically compared with Bush B.

The three Bush languages are:

A. !Kung; the subject of this dissertation. Also known in the literature as Kung, !xũ, Auen, Kaukau, and //au//ei; !Kung speakers extend from the Ghanzi farms in the south through western Bechuanaland and northeastern South West Africa, north into Angola.

B. ɸhũa; also known as Magong, !xõ (not to be confused with !xũ), !xoŋ, ɘwaɘwani.[1] These people live south of Ghanzi farms and extend into the Kalahari Gemsbok Game Reserve of South Africa.

---

[1] ɘ is the symbol for the 5th Bushman click, known as the kiss click. This click is confined to Bush B, C and D languages and therefore not considered in the linguistic sketch of Chapter I.

197 C. -ŋ/huki; also known as ≠khomani (Doke 1936) and //n-!ke (Bleek 1929). A very small group now confined to the Gemsbok Park.

The numerical strength of the various Tshu-khwe and Bush languages are estimated as follows:

Xũ (Kwengo)	2,000
Shua (Danisin etc.)	3,000
//gabake (Hiechware etc.)	10,000
Deti (Tletle)	2,000
Nharo (/gwi, //gana etc.)	9,000
Bush A (!Kung)	13,000
Bush B (≠hũa)	1,600
Bush C (ŋ/huki)	50
TOTAL	40,650

The remaining 3,450 Bushmen of the estimated total of 44,100 include over 3,000 Hai//om (Heikum) in South West Africa. These people speak a dialect of Nama Hottentot and have a tradition of hunting and gathering although only a small proportion do so today. Also included in the remainder are a small group of people around Lake Chrissie in the [101] Eastern Transvaal. They are locally known as Batwa and number [114] less than one hundred. Westphal includes them as his Bush D language and calls them "//xegwi." (See also Lanham and Hallowes 1956; Potgieter and Ziervogel 1955).

The economic position

114 224 222 161 Tobias erred when he estimated that in 1956, 35,000 of the 55,000 Bushmen "lead a hunting and food-gathering life, barely removed from that of the late Upper Palaeolithic or of the South African Later Stone Age." (1957:33). The first comment concerns the numbers of Bushmen still hunting; the second the "primitiveness" of the modern Bushmen hunters.

162 131 464 648 224 Of the 15,000 Bushmen in South West Africa at least 9,500 are working on European farms. An additional 3,000 are either working for Bantu agriculturalists or practicing agriculture and stock-keeping themselves. (Republic of South Africa 1964:29,41). This leaves 2,500 as hunter-gatherers in South West Africa.

In Bechuanaland an estimated 16,300 Bushmen work on European farms or Bantu cattle posts. A further 2,000 are practicing a mixed agricultural and hunting way of life. The remaining 6,100 lead a hunting and gathering way of life. The main concentrations of the latter are in the Central Kalahari Game Reserve (3,000) and in western Ngamiland (1,600).

The Batwa of the Lake Chrissie area have been working on European farms for nearly a century (Potgieter and Ziervogel 1955:3). The Bushmen in the Gemsbok Park are a major tourist attraction, but may do some hunting.

In Rhodesia, the Bushmen in the Wankie area are all

162 working on farms. Many of the Pandamatenga Bushmen work in
131 Victoria Falls and Livingstone. Some have gone as far afield
464 as Lusaka and Salisbury looking for work. The Kwengo Bushmen
648 of Barotseland no longer maintain a hunting way of life.
224 (Clark, personal communication). Their numbers are estimated at 200.

161 This tally of Bushmen hunter-gatherers gives a total of
162 9,300 against an overall total of 44,100 Bushmen. Twenty
224 percent of the Bushmen hunting full time seems a much more
222 reasonable proportion than Tobias' 64 percent. It is unlikely
[114] that a change of such magnitude could have occurred between the date of his census (1956) and the present one (1964).

162 The figure of 9,300 is nevertheless quite substantial
224 and indicates the remarkable persistance of the hunting-
222 gathering way of life in spite of the fact that even the most
178 isolated of the hunting tribes maintain close contact with
184 their European and Bantu neighbors. A large proportion of
[221] the /Gwi Bushmen of the Central Kalahari Game Reserve spend
[648] part of the dry season squatting on European farms adjacent
[312] to their area. In the north the hunting !Kung often share
[464] their waterholes with Bantu cattle herders. Most of the
[233] young !Kung men spend a year or more working as cattle herds on a contract basis.

000 As far as is known, all Bushmen hunting today have had

The !Kung Bushmen

101
131
162 The !Kung are the most numerous of the surviving Bushman tribes. Of the estimated total of 13,000, about 3,000 live in Angola, 2,000 in Bechuanaland, and 8,000 in South West Africa. The !Kung occupy a remarkably large area. Their country extends from north to south for a distance of 500 miles, and from east to west for a distance of 300 miles (see Map 5).

101
197
553 Two criteria clearly distinguish the !Kung from all other Bushman peoples: their language and their unique system of
19 personal naming. The !Kung language has phonological features in common with adjacent Tshu-khwe and Hottentot languages, such as the four click system and the strong glottal releases. However, the vocabulary and grammar of !Kung sets it apart from the other click languages. A lexicostatistic comparison of !Kung and Nharo showed a low incidence of cognates (11.5%).
[114] The grammar of !Kung has yet to be adequately described, but
[193] none of the preliminary work by Doke (1925), Bleek (1929), Maingard (1957), and Westphal (1962, 1963:244) has been able to demonstrate a genetic relationship of !Kung grammar to the grammars of the other click languages.

There are no semi-!Kung languages (although the vocabulary of the southern dialect has been influenced by contact with Nharo) and therefore a native speaker of !Kung is immediately identified as a member of the !Kung tribe. This holds

131
131
312
133
[162]

this area is waterless and uninhabited. In the center is a ring of pans and a series of waterholes which support at present a population of 1,200 !Kung Bushmen. They occupy an area of about 3,500 square miles (70 miles from east to west x 50 miles from north to south). This central complex of water sources is surrounded by a belt of waterless, uninhabited country that varies in width from sixty miles, on the east and north, to over one hundred miles on the west and south. Access to the interior is limited. One line of wells links Tsumkwe in the interior with Grootfontein on the west.

[491] Two rarely used motor tracks join the interior with the Okavango swamp to the east. A police patrol road cut in 1954-55 runs from south to north along the B.P./S.W.A. border. The maximum vehicle speed obtainable on these tracks is 20 mph [177] and trucks pass through about once a month. The difficulty of the terrain, the lack of farming potential, and the scarcity of water have deterred European and Bantu penetration of the area.

[114] The distinction between periphery and interior has been applied to the country of the central !Kung by John Marshall (1957) and Lorna Marshall (1960:327ff). The present usage differs from that of the Marshalls. They applied the term "interior" to the Nyae Nyae ring of pans and regarded the waterholes at /"ai/"ai, /Gam, and !angwa as peripheral. Since

III. THE DOBE AREA: ITS PEOPLES AND HISTORY

[13] Dobe, a small waterhole on the South West Africa/
[114] Bechuanaland border, ninety miles west of Nokaneng, B.P., was the location of the author's main field camp. The term, "Dobe area", as used in this report refers to the country
[312] within a thirty mile radius of the Dobe well. This includes the eleven permanent waterholes which support the entire population of Bushmen and Bantu in the Bechuanaland sector
[224] of the !Kung interior. The Dobe area also includes a large
[222] tract of ground in South West Africa where Bechuanaland Bushmen traditionally go to hunt and gather. It does not include the Nyae Nyae pans, /gam and Tsumkwe in South West Africa, or the more distant waterholes at n!aun!au, at !ǂudum, or at Tsodilo Hills in Bechuanaland (see Map 8).

Dobe is not the cultural or administrative center of the settlements of the interior !Kung. On the contrary, Dobe is the most isolated of the waterholes on the Bechuanaland side. The term "Dobe area" is applied here simply as a matter of convenience.

To reach the Dobe area by truck, one drives west from the Batawana town of Nokaneng which is situated on the western edge of the Okavango swamps. After traversing uninhabited country for 67 miles the traveller arrives at

!Kung

IV. THE ENVIRONMENT

131 The area under consideration is a tract of land in Bechuanaland and South West Africa. The boundaries are the Okavango River on the north and east, the Ghanzi Farms on the south, and the edge of the South West African Escarpment on the west. The area thus defined (excluding transitional zones on the edges) is c. 160 miles x 160 miles = 25,600 sq. miles.

133 The area is characterized by a series of fixed dunes running parallel to each other 5-50 miles in length oriented approximately W 10° N / E 10° S. In the spaces between the dunes, 1-5 miles in width, are basins or molapos. "Molapo" is a Sechuana word meaning dry river bed. It is used throughout the thesis when referring to the longitudinal depressions between the dunes as well as the more deeply incised river valleys that do not conform to the parallel
• [114] patterning of the dunes. "Molapo" is the Sechuana equivalent of "omaramba", a Herero word used by J. Marshall (1957), Story (1958), and others.

The combination of basin and dune forms a remarkably uniform pattern from north to south. At several points the landscape is incised by deeper drainage systems that expose the bedrock. The molapo dune pattern is also interrupted by

224
146 totalling 36 lbs. This meat (490 lbs.) went to feed a camp of 42 people (exclusive of visitors).

A rough calculation of the weight of meat per person per day through this 28-day period gives a figure of 6-2/3 oz. of meat. The daily intake of vegetable foods per person during the same period can be estimated at 24 oz. (of mongongo nuts and various roots). Therefore a reasonable estimate of the ratio of meat to vegetables in the diet of this camp is 25%-75%.

This ratio is based on observations at one camp during [114] one season only. It can be said, however, that George Silberbauer, Laurence and Lorna Marshall, and the author are in general agreement that meat comprises between 20% and 40% by weight of the Bushman diet (Silberbauer, 1965:28; Marshalls, personal communication).

5. Late Winter

221 There is a well-defined break point in the winter subsistence cycle between the early period (May, June and July) of relative abundance and the late winter and spring period 221 of increasing food scarcity (August-September). Through the 222 early winter the Bushmen concentrate on the mongongo nut groves 462 that are within a day's walk of permanent water. Groups of women go out once every three or four days, fill their karosses with nuts and return to the camp in the evening. The men

IX. FOOD, WORK AND LAND USE AMONG THE !KUNG BUSHMEN

114
433
609

An observer planning to live with Bushmen is led to expect - from the ethnographic literature - that the Bushmen lead an arduous and exacting way of life, in which the problem of getting food is an overwhelming daily concern. Furthermore I had been told, by local Europeans, that the Bushmen were extremely shy and difficult to find, and that they were always on the move in their endless quest for game. Therefore I was unprepared for the situation in the Dobe area when I first arrived there at the end of the dry season of 1963; for camped at every waterhole were dozens of Bushmen who offered the outsider a hearty welcome and who were seemingly unconcerned by the problem of finding food.

During the course of the study, it became apparent that the Bushman subsistence was more substantial and secure than had been previously supposed. In the foregoing chapters the properties of their hunting and gathering way of life have been described. It will be appropriate, in this final chapter, to review the lines of evidence that bear on the probler of how such a carefree and secure existence is possible in a society of hunter-gatherers living in a harsh, semi-desert environment.

Chapter IV

SOCIAL ORGANIZATION

Tribe and Hunting Band

All the Bushmen in their native condition lead a nomadic hunting 222
and collecting life, roaming about in search of the game and wild 224
vegetable foods upon which they depend for their existence. The [182]
conditions of their subsistence necessarily prevent them from banding
together permanently in any considerable numbers. Wherever they 621
still retain to any marked degree their original mode of life and
organization they are found scattered over the land in small separate
communities.[1] Each such community will be spoken of here as a
hunting band. The members of a band share a common life, they see
one another constantly, they co-operate in many ways, and they are
all as a rule friendly and on fairly intimate terms. Each band also [619]
has occasional relations with other neighbouring bands, through
intermarriage and trade, and visitors may pass from one to another.
On the other hand, there are often quarrels between neighbouring [628]
bands, which may result in a prolonged state of feud and even lead
directly to warfare.

The various bands among the Heikum are generally referred to 621
among each other by a name which indicates either the locality in 101
which they live, or describes some physical or other characteristic
of the band itself or of its locality. The *se-khoin*, for example, are the
people of the *seb* or plain; the */gom-khoin* the people who eat the

[1] The social organization of the Bushmen is one of the least-known aspects of their culture, and sadly needs careful and detailed investigation. The most reliable sources of information refer almost exclusively to the North-Western tribes: Passarge, *Die Buschmänner der Kalahari*, 1907; Kaufmann, "Die Auin," *Mitt. deuts. Schutzgeb.*, xxiii (1910); (Miss) D. F. Bleek, "Buschmänner von Angola," *Archiv Anthrop., N.F.* 21 (1927); *idem, The Naron*, 1928; *idem*, "Bushmen of Central Angola," *Bantu Studies*, iii (1928); L. Fourie, "Customs of the Hei-//om Bushmen," *J. SW. Afr. Sci. Soc.*, i (1925–6); *idem*, "The Bushmen of South-West Africa," in *The Native Tribes of South-West Africa*, 1928. The relevant literature on the other tribes is for the most part fragmentary, although some valuable data on the Namib Bushmen are given by Seydel, "Aus der Namib," *D. KolBl.*, xxxi (1910), and by Trenk, "Die Buschkute der Namib," *Mitt. deuts. Schutzgeb.*, xxiii (1910). Where no special reference is made to any particular tribe the analysis given above must therefore be regarded as applying especially to the North-Western tribes, who are also the only Bushmen still leading a fairly independent life. [114]

2: Schapera E-4, 5 (no date)1930
FX13 Hottentot
Bushmen FX10

621 101 *lgom* or omungete nut; and the *xom-khoin* the people who *xom* or scrape together, the name indicating their method of collecting salt on the Etosha Pan, along whose southern border they live.[1] How the bands are named in the other tribes is not clearly stated. In the [114] literature they are spoken of as a rule in terms of the locality they inhabit, but no indication is given whether this is also the name by which they call themselves and are known to their neighbours.

619 101 These hunting bands are grouped into what are here called "tribes". A tribe consists of a number of neighbouring bands, the members of which all speak what they themselves regard as one language. Each tribe has its own distinctive name. In the Southern and Central linguistic groups this usually ends in the word */ke* or *kwe* respectively, i.e. "people"; but in most cases the meaning of the name itself has not been recorded or can no longer be determined. The few tribal names which can be interpreted seem to refer to some general characteristic of the people themselves or of the country which they inhabit. The *//ŋ /ke*, for example, are the "home people"; the */tannekwe* the "river people"; the *Hiechware* the "people of the open country", and the */o /kũ* the "forest people", while the */kũ* (*Kung*) are simply "people", or, as they would interpret the name "Bushmen". The *Hei-//om*, again, derive their name from the [177] Hottentot words *heis*, tree or bush, and *//om*, to sleep, and are therefore the "tree-sleeping people", i.e. those who sleep under trees; while the term *Naron*, by which the *//aikwe* now sometimes speak of themselves, appears to have been applied to them originally by the Auen and to mean "people who are insignificant".

619 The tribe is fundamentally a linguistic group. It has no social [197] solidarity, and is of very little, if any, importance in regulating social life. There appears to be no tribal organization among the Bushmen, nothing in the nature of a central authority whose decisions are binding on all the members of the tribe, nor is collective action ever taken in the interests of the tribe as a whole. The tribe in fact is merely a loose aggregate of independent hunting bands which have a common language and name.

621 The band, and not the tribe, is the real political body among the Bushmen. Each band is autonomous, leading its own life independently of the others. Its affairs are as a rule regulated by the [623] skilled hunters and the older, more experienced men in general. In [622] the North-Western tribes, however, each band has also a chief, whose

Bushmen FX10

114 131 621 There is unfortunately no reliable information available as to the extent of territory occupied by the band. The only writer to touch on this question is Seiner, who estimates that in the Grootfontein district in the north-east of South-West Africa the average hunting territory covers about 700 sq. km.[1] This figure, however, cannot be regarded even as approximate, for it is based on what is almost certainly an excessive estimate of the total Bushman population in that district.

Size of the Band

162 621 The number of people who make up a band varies from tribe to tribe, and even within the tribe itself, although it is never considerable. Some of the older writers on the Cape Bushmen speak of bands containing from one hundred to one hundred and fifty persons,[2] but groups much smaller in size are also mentioned.[3] Certainly in more recent times the number of families living together seldom exceeded three or four.[4] The remnants of the Namib Bushmen now also live in very small groups of only a few persons,[5] and so do the Hiechware in the Eastern Kalahari, where a band rarely has more than about twenty members.[6] Elsewhere Dornan states that he has seldom seen more than six or seven families together at a time, all told about thirty persons, and this was in a camp at permanent water.[7] The !O Kung in Angola are also found living together in very small bands. The largest group met by Miss Bleek consisted of sixteen men and fifteen women; everywhere else little parties were seen of from two to six men, with their wives and families.[8]

621 648 [177] In considering these figures it must be remembered that the Cape Bushmen were already being persecuted and dispersed, and their organization disintegrated, by their more powerful neighbours at the time when they came under observation, while the Namib Bushmen are now almost extinct and live in very unfavourable country. Whether they were formerly banded together in larger numbers there is no means of telling. The Hiechware and the !O Kung, again,

are the serfs of the interdwelling Bantu, and the conditions under which they live do not, therefore, permit of their association in large groups. 621 648

In the tribes to the north-west who still retain to some extent their own mode of life and organization the communities are on the whole somewhat larger, although the numbers fluctuate a good deal. 162 621 In the Kaukauveld Passarge frequently saw bands of up to thirty persons, and in the Mahuraveld of between twenty and twenty-five persons.[1] Among the Naron, again, Miss Bleek speaks of a camp containing from sixty to eighty persons,[2] while among the Auen, according to Kaufmann, up to thirty families, i.e. about one hundred persons, may be found camping together.[3] Both writers agree, however, in stating that the numbers may at times be considerably less. Müller visited eight camps of Bushmen in the Kaukauveld, and the figures given by him show that in six of them the population ranged between thirty and seventy, while the remaining two had one hundred and fifty and two hundred inhabitants respectively.[4] Seiner, again, states that the bands of the Kung average fifty persons, although he mentions two encampments in the vicinity of Karakuwisa which were considerably larger[5]; while among the Tannekwe he found five encampments of Bugakwe, whose population he estimates altogether as two hundred and twenty, eight of Garikwe containing all told about four hundred and thirty persons, and one of Gokwe with ninety.[6]

Not too much weight can be laid on the actual figures given, as for the most part they are based on what are obviously rough estimates, not accurate observations. There seems little doubt, however, that among the North-Western tribes the bands are on the whole more considerable than in any of the other tribes, and the average given by von François[7] of between fifty to sixty persons to a band may be taken as fairly representative, although as we have seen the numbers fluctuate a good deal. [114]

Part of the difficulty in obtaining accurate information about the size of the band lies in the fact that the families composing it are not always found living together in one encampment. Within the 166 361 621

obvious from the fact that although several chiefs were present, there was no common supreme chief.[1] Such gatherings are only temporary in nature, and produced by some special circumstance. They cannot therefore be regarded as indicative of the normal groupings of the Bushmen. 361 619 621 [622]

Social Structure of the Band

Within the band the only division is into families. The family among the Bushmen consists of a man and his wife or wives, together with their dependent children. It is a unit of outstanding importance in their social and economic life. The members of a family usually live together in one hut; the children until they are mature remain under the direct control of their parents, are nourished and are educated by them; husband and wife jointly contribute to the maintenance of their household, and the domestic tasks and industries are apportioned between them according to fixed custom. The family, moreover, has much freedom of movement, and, as already mentioned, single families will often roam about separately for a while within the territory of their band. 592 [595]

The relationship between the different families constituting a band is seldom defined clearly by the various observers. In particular the information available about the kinship organization of the Bushmen is very inadequate. Miss Bleek has recently published lists of relationship terms for each of the three main linguistic groups defined by her.[2] From these it appears that among all the Bushmen there are, in addition to various descriptive terms of relationship, also certain terms applied not to individuals but to whole groups of different relatives, while still others are used reciprocally between people standing in a particular relationship to each other. Relationship terms of the last two types, when found in other societies, are usually indicative of a definite organization of the community on the basis of kinship; and it is probable therefore that some such organization exists among the Bushmen as well. Unfortunately the lists given by Miss Bleek appear to be drawn from vocabulary sources rather than from an actual study of kinship itself, and cannot therefore be used with any degree of confidence. In any case they throw 114 601 602 621 114 601 114 602

[1] Op. cit., 138, 155. It should be mentioned here that the figures given by Kaufmann are, as a rule, far in excess of those given by other writers of about the same time and on the same district (e.g. Müller, German official estimate), and cannot therefore be accepted without question. [114]

Bushmen FX10

114 but little light on the social organization of the people, since the
602 information given about the rights and duties regulating the conduct towards one another of people related either by consanguinity or through marriage is somewhat meagre. But they suggest at least that there is much in the social life of the Bushmen which could be revealed by a careful study of the usages connected with kinship.

There is some evidence, however, to show that among the Cape
621 and Namib Bushmen, who as we have seen live in very small groups, the members of such a group are as a rule all related either by consanguinity or through marriage. Of the Cape Bushmen, for example, Miss Bleek says elsewhere: "They live in small family groups, and have no chiefs. . . . Three or four huts stand together. In one is the father, in others his married children. At most eight or ten huts of connections were dotted about within a radius of a few miles from the water, but this is an institution of later days . . . (at marriage)
[591] sometimes the young couple build their hut near the bridegroom's father, sometimes near the bride's. They seem to keep the family groups fairly even."[1] The accounts given by Trenk and especially
[114] by Seydel of the social structure of the band among the Namib Bushmen are not nearly so definite, but on the whole seem to indicate a similar principle of grouping.[2]

This is also found among the !O Kung of Angola, where again the local groups are very small. The details given by Miss Bleek bring out very clearly the structure of these groups[3]: "The families living together are nearly always related; in two cases the men were brothers-in-law, in the first the sister of one man was the wife of the other, in the second the wives were half-sisters. A cousin of the wives and an aunt resided with them. At another place I found a father with his second wife and small children, a grown-up son with wife and children, and a grown-up daughter whose husband was temporarily absent. The next lot were uncle and nephews, then a mother with married daughter, with a nephew and step-son of the mother's. The last lot encountered, the horde on the Mushumbo, consisted of an old man with two sons, several grandsons both in the male and female line, a son-in-law and nephews and great-nephews, mostly brother's descendants. He introduced himself as the 'father'
[888] of them all. Chiefs are non-existent, but deference is paid to the

184 while of the Aikwe (Naron) Passarge says that a man wishing to marry
582 must select his bride from another band, since marriage within the
621 band is not permitted.[1] A few cases were found by Miss Bleek among the Naron at Sandfontein in which both husband and wife were from one village. The fact, however, that such marriages were regarded by the people as being against the general rule indicates that here, too, the tendency is to insist on marriage outside the band.[2]

After marriage the wife generally goes to live with her husband's
591 people, although the young couple may remain for some time with
183 the wife's parents before finally settling at the husband's home.[3] As a rule, therefore, marriage is patrilocal. Among the Naron, however, this rule is not always strictly observed, although it is recognized. "Women are said to leave their own home on marriage, and to be taken to the husband's home. But in a few months, when the wife has settled down, it is customary for the young couple to return to her parent's home and stay there until the first child is about a year old, so that the girl may have her mother's help and advice. Sometimes the son-in-law settles altogether with his wife's people, but not always. In fact the Naron all say that a man must settle at his father's place, though they do not always do so."[4] Passarge
114 indeed, goes so far as to assert of this tribe that the man definitely
591 joins the family of his wife, and becomes a member of their band[5]—a fact which he interprets elsewhere as denoting that the Bushmen are a matrilineal people.[6] It is far more probable, however, that he was misled by the custom of temporary matrilocal marriage than that the condition he describes is the normal rule. There is no other evidence to support his statement that the Bushmen have matrilineal institutions.

In fact the prevailing rule in these tribes that marriage should be exogamous and patrilocal suggests rather the possibility that
621 the families constituting the band may be related to one another in the male line. The only definite statement to this effect is about the Heikum, of whom we are told by Fourie that a band consists of the

FX13 Hottentot
Bushmen FX10

male relatives of the chief with their wives and families.[1] The relationship to one another of the families in the bands of the other North-Western tribes is not indicated by our authorities. It is reasonable, however, to expect that most of them at least will be similarly connected, since as a rule married sons with their wives and children will remain together in the same band as their father, while married daughters will leave it to join the bands of their husbands. Moreover, in case of divorce the children remain with their father, and although unweaned children must go with their mother, they can be claimed later by him if he likes.[2]

Dornan says that "the Bushmen of the Kalahari are divided into many small clans",[3] but the term "clan", as used by him, applies sometimes to what has here been called a tribe, and sometimes to a hunting band. He speaks also of exogamous "totemic families" and "totemic clans" among the Hiechware and adjoining tribes, but admits that here the occurrence of this "totemism" is the result of Bantu influence.[4] There is no evidence yet that definitely goes to show the existence of totemism among any of the other Bushman peoples.

Nor, as far as can be seen at present, is there any real clan organization among the Bushmen.[5] The bands of the Cape and Namib Bushmen and of the !O Kung are certainly not clans, while the little we know of the social structure of the band among the North-Western Bushmen does not in itself justify our regarding them as such. There is also nothing at all to indicate the existence of a clan organization cutting across the system of grouping into hunting bands.

It must again be emphasized, however, that our knowledge of the social organization of the Bushmen is fragmentary, and that there are many questions relating to the structure of the band about which no adequate information is available. We are nowhere told clearly, for instance, how membership of the band is determined among the North-Western Bushmen.[6] In general it would seem that children

[1] Op. cit., 86. [2] D. F. Bleek, *The Naron*, 34; Kaufmann, op. cit., 157.
[3] *Pygmies and Bushmen of the Kalahari*, 67. [4] Op. cit., 161; cf. 68, 128.
[5] The *clan* is commonly defined as "an exogamous, unilateral group of persons all the members of which are held to be related to one another and bound together by a common tie. This tie may be a belief in common descent from some ancestor, real or mythical, it may be the common possession of a totem, or the common habitation of a village or district" (*Notes and Queries on Anthropology*, 5th ed., p. 55). A patrilineal clan is one of which membership is determined by descent traced through the male line, i.e. a person belongs to the clan of his father and his clansmen are related to him primarily through his father. A matrilineal clan is one in which descent is similarly traced through the mother.
[6] Lebzelter, in his preliminary account of the Kung (op. cit.), says curtly (p. 114) that a boy belongs to the family of his father, a girl to that of her mother ("Die Knaben gehoren zur Sippe des Vaters, die Mädchen zu der der Mutter"). This statement is at variance with all so far known about the Bushmen, and needs to be confirmed before it can be accepted as accurate.

2: Schapera E-4, 5 (no date)1930
FX13 Hottentot
Bushmen FX10

361 [606] exists among the *Hei-//om* in common with other Bushman tribes." Within the circle of huts towards the south is the hut of the adolescent [882] young girls, and towards the north that of the adolescent young men; mature marriageable young women occupy huts next to those of their parents in the circle. Old widows and widowers, as also [589] visitors from any neighbouring group, live outside the circle of married people. The dancing place is to the west within the circle.

"The large tree (*!heis*) in or near the centre of the *//gaus* is reserved 361 as a meeting place for men for ceremonial and other purposes. Women 562 are entirely forbidden to approach it or to join the men when gathered underneath it. To this, however, there is one exception, namely, [622] the wife (*gei-khois*) of the *gei-khoib* may go to it to obtain fire for kindling the principal fire (*!ou-|ais*) or for other menial purposes when required by her husband. With the exception of the chief nobody is permitted to live in close proximity to this *!heis*. Under [372] it is made the first fire (*!hei-|ais*) on the establishment of a new [224] *//gaus* and underneath it is deposited, for distribution, all meat killed in the chase."[1]

● 114 Fourie speaks of this camp arrangement as being present among all the Bushmen in the northern parts of South-West Africa,[2] but the 361 only confirmation for this statement is given by Vedder, who just hints at a similar arrangement of the camp among the Kung. "Where several families live together," he says, "the huts are ranged in a circle, the head of the group ("Dorfälteste") living in the east."[3]

592 Each family within the group has its own hut. Where the families are polygynous, the wives may live together in the same hut if they [595] get on well; otherwise each will build herself a separate hut. Children sleep with their parents until strong enough to go about by themselves. The bigger boys and young bachelors sometimes share [882] a hut together, but generally they sleep out in the open under a tree, and only in very wet weather will their mothers in co-operation build them a hut. Unmarried girls too old to sleep with their parents also share a separate hut. An old widower may live alone, or with [589] a boy; a widow and her little children, where they do not live alone, are generally quartered with the girls.[4]

342 The huts themselves (Plate VI) are somewhat crude, consisting as a rule merely of a semicircular shelter of branches planted into

FX13 Hottentot
Bushmen FX10

372 by him by means of the *hei-doros*. The new */ou-/ais* now serves to
622 supply the other members of the group. At times it may happen that all the members of the community may not be living in the *//gaus* (camp), but in some outside werft. This is usually the case only in
361 times of drought when the game has moved far afield and great
221 difficulty is being experienced in obtaining veldkos. Further, people
672 driven out by another group and seeking protection are sometimes
622 allowed to live some distance away from the *//gaus*. Such communities are not allowed to make their own fire or to obtain it from any other source, but the */ou-/ais* of the *gei-khoib* in whose territory they are living.

"Persistent ill-health among the members of the community or diffi-
622 culty in obtaining veldkos or want of luck in the chase may cause the
372 *gei-khoib*, either of his own accord or after consultation with his people, to proclaim that it is necessary to make a new fire. In such an event all fires, including the */ou-/ais*, are extinguished by being covered over with ashes. The *gei-khoib* at the same time notifies all outside camps of his decision and the latter likewise extinguish their fires. He then kindles a new */ou-/ais* in front of his hut with the *hei-doros* and applies *!norab* and *dabas* in the manner described above. The new fire is not made on the same spot as the old fire, but a few feet away from the place on which it has been."

"The custom of kindling and maintaining a perpetual fire,"
114 Fourie goes on to say, "is met with among all the organized primitive
372 groups" of Bushmen in South-West Africa. The only previous
622 information hinting at observances of this kind is found in a curt statement by Kaufmann that among the Auen the "captain" of a village sees to it that the fire does not go out. But he adds that there is no "sacred" fire, and attributes the guarding of the fire against extinction to the practical inconveniences of the method employed in making it.[1] Quite recently, however, Lebzelter has reported the occurrence of similar observances among the Kung, although his remarks on the subject are very scanty. He states merely that the Kung, like the Bergdama, have the sacred fire round which only the men may sit. "When the camp is moved," he concludes, "the head of the group takes with him a brand from this fire"[2]—presumably to use it for

[1] Kaufmann, op. cit., 139; "Der 'Kapitän' (Aichab) der Werft achtet darauf, dass das Feuer nicht ausgeht. Ein 'heiliges' Feuer ist nicht vorhanden. Die Bewahrung des Feuers vor dem Verlöschen geschieht lediglich aus praktischen Gründe, da das Feuerquirlen immerhin ziemlich anstrengend ist."

[2] "Bei den !Kuh-Buschleuten," 14: "Wie die Honigkaffern haben auch die !Kuh das Sochafeuer. Es ist dies das heilige Feuer, bei dem nur die Männer sein dürfen. Wenn die Werft übersiedelt, dann nimmt das Werftoberhaupt einen Feuerbrand mit Sochafeuer mit."

Bushmen FX10

lighting a new fire at the next encampment, although this is a practice which, as we have just seen, Fourie explicitly denies for the Heikum. 372 622 [114]

There is no indication at all in the available literature that similar usages relating to fire are found among the rest of the Bushmen, nor [184] is there any further evidence of their occurrence among the tribes mentioned above. On the other hand the sacred fire also plays a very conspicuous part in the social and ritual life of the OvaHerero, 171 OvaMbo, and Bergdama, all of them close neighbours of the Bushmen 372 tribes among whom it is found, and with the last two of whom the Heikum at least have intermixed considerably. It is probable therefore that the special observances relating to fire among the Heikum and the Kung may represent borrowed elements of culture; but much [177] fuller information is needed about them before this can be definitely asserted. Whatever their origin, however, these usages now obviously play an important part in the social life of the people. In particular, the fact that at the present time the chief of the band has certain ex- [622] clusive functions in connection with fire is of outstanding significance in the whole sphere of public life, and one which cannot be dismissed merely because it may be due to the effects of contact with other peoples. To this point we shall have to return when discussing the political institutions of the Bushmen.

Special Usages relating to Food

There is not much information available about food taboos, but 262 it appears that, in some of the tribes at least, certain foods are forbidden 825 to persons at different stages of life. In the texts obtained by Dr. Bleek and Miss Lloyd from the Cape Bushmen there are preserved the details of some of the food taboos prevalent among this people. Thus little children were not allowed to eat the heart of the jackal (on account of this animal's great timidity), certain portions of the ostrich, or the tip of the springbok's tail; a menstruating girl might not eat game [841] killed by the young men, lest she bring them ill luck—she had to eat only game taken by her father; a certain kind of tortoise was forbidden to young unmarried men and women, for fear of arousing [821] the wrath of the rain; women were not allowed to eat the flesh of the lynx; the tail of the porcupine was forbidden to certain (unspecified) persons; while all refrained from eating a certain small 262 portion of the flesh of the hare.[1] The published information relating [114]

[1] L. C. Lloyd, *Further Bushman Material Collected*, 23; Bleek and Lloyd, *Bushman Folklore*, cf. references in Index, s.v. "Food—not to be eaten."

2: Schapera E-4, 5 (no date)1930
FX13 Hottentot
Bushmen FX10

262 to these taboos is unfortunately so fragmentary that little can be
[114] gathered of the ideas underlying them. Several of them are
[821] undoubtedly connected with wider ritual observances, e.g. the taboo
[821] imposed on menstruating girls, and again that associated with a
certain belief about the rain; but of the others no full explanation is
[773] available, although the taboo on the portion of the hare may possibly
[761] be linked up with the Bushman myth of the origin of death, in which
[825] the hare plays the part of the fateful messenger who distorts the
promise of immortality sent to mankind by the moon.

Among the Naron, again, "It does not seem," says Miss Bleek,[1] "as if many taboos in the food line still existed. Paauw meat and ostrich eggs are chiefly given to old men as the greatest delicacies. Some say young children, or girls till they have had their first baby, are not to eat steenbok, lest they remain small, but others tell me that all meat is eaten by everyone. Honey touched by a baboon must not be eaten, or you will die." Among the Auen, young girls and boys apparently may not eat game at all, otherwise they will remain thin; while water
[841] and food collected by a menstruating woman may be partaken of only by herself and old people—it "makes others weak".[2]

About the Heikum we have far more information on this point,
224 thanks to the excellent description given by Fourie of certain
[114] of their hunting observances.[3] The details he gives throw such a wealth of new light upon this aspect of Bushman life that they may be quoted in full. "After an animal has been shot it is followed by the hunter until it expires or until nightfall when he returns to the *//gaus* (camp). The following morning the whole community takes part in the search for the carcass, as the previous day's tracks had in all probability been effaced during the night by other animals.
224 The searchers spread out on a wide front and keep a very sharp lookout
252 for the presence of vultures. After the carcass has been found it is
[462] skinned by the men. The belly is then opened and the entrails removed and cleaned. Bags are made from the stomach and into these the blood is collected. The animal is next cut up and, after this has been done, the liver is roasted and eaten by the men. The skin, if suitable for the
[281] purpose, is cut into sandals, bowstrings, etc., on the spot. The meat is then removed to the *//gaus* by the men who may occasionally be
[462] assisted by the women. On arrival at the *//gaus* all the meat is laid

FX13 Hottentot
Bushmen FX10

224 animal has been shot. The meat which may be eaten by the *axarogu*
262 (youths) is known as */om-//gani*, and includes the flesh of the abdominal wall, kidneys, etc., and the genital organs such as udder, testicles,
224 etc. It is prepared by the *axarogu* themselves over their own fire at
252 the *axarogudi ǂgaos* (young men's hut). The person who shot the
262 animal receives the ribs and shoulder blade of one side. He may prepare his portion either under the */heis* or over his own fire. The ribs must be cooked and the shoulder blade roasted because they taste better when done in this manner. The rest of the meat is *soxa* to him, and if he eats any other part, e.g. the *ǂkoms*, he will not meet with success in hunting because the poison will weaken and refuse to act. The parts of the animal which go to the *gei-khoib* are known as the *so-eis* and include portions of about two finger-breadths in size from each quarter, from each side of the back and one rib from each side. These are strung on a thong or cord and hung up for his sole use. *So-eis*
[574] may, however, be shared by him with a visiting *gei-khoib*. The *gei-khois* receives her share from the *ǂnoe-di*. The *gei-khoib* may also partake of the meat for the remainder of the men called the *so-//gani*,
[264] under which is included the *ǂkoms*. The latter may be eaten only under the */heis*. After it has been prepared each man brings his wooden bowl or other receptacle and helps himself. Any man whose wife is
[841] menstruating will, however, not partake of the *ǂkoms* as it contains blood. The rest of the meat is divided among the men by the *gei-khoib*, and is prepared and eaten at their huts.

"A similar procedure is adopted in connection with meat killed by
224 the members of an outlying *//gaus*, the *gei-khoib* likewise having to
262 taste it before it may be partaken of. He may either proceed to the
622 *//gaus* concerned, or if the distance to be travelled is considerable, all the meat will be brought to his *//gaus*. In all such cases the *so-eis* is brought to him by the messenger sent to notify him of the kill. When he visits a *//gaus* for this purpose he kindles the */hei-/ais* with
[372] fire from one of the huts, and, after having tasted the meat, returns to his own."

114 Apart from the light it throws upon certain functions of the chief,
224 this account illustrates admirably both the existence of special ritual observances in regard to game killed in the chase, and the fact that
[622] food obtained in this way is shared among all the people present at the encampment. This latter feature has also been noted by other writers on the different Bushman tribes,[1] and it can safely be asserted

[1] Passarge, op. cit., 55; Kaufmann, op. cit., 155–6 D. F. Bleek, *The Mantis*, pp. viii–ix; *idem*, *The Naron*, 16.

2: Schapera E-4, 5 (no date)1930
FX13 Hottentot
Bushmen FX10

that among the Bushmen all game is shared out among the members of the band. To what extent the same elaborate rules of division exist in the other tribes is difficult to determine. The only other indication of similar practices is found in the texts obtained by Bleek and Miss Lloyd from the Cape Bushmen. Only a selection of these have so far been published, and the information contained in them is rather fragmentary. But it appears that women, for example, were not permitted to eat the meat of the shoulder blades, lest the men subsequently prove unsuccessful in hunting; that the man who shot the animal might not take part in cutting it up; and the bones which were left over had to be carefully put aside in certain special ways.[1] Obviously such usages hint at an elaborate procedure in regard to the cutting up, distribution, and treatment of the meat; and one can only regret that all the details relating to them have not yet been made available.

Narcotics

As narcotics the Bushmen use chiefly tobacco and dagga (*Cannabis sativa*), the latter a herb with marked intoxicating effects. All grown-up people, and even small children, smoke tobacco when they can get it. They do not cultivate it themselves, although a few men among the Auen and the Naron are said to have made slight efforts to grow tobacco and dagga after the manner of their Bantu and Bergdama neighbours.[2] Almost all the tobacco used by the Bushmen is imported through trade or obtained by service with other peoples, and they are always extremely keen to acquire it.

In the north-west their pipes (Plate XI) are generally tubes of serpentine, some 3 inches long and rather wider at one end than at the other, which are cut and hollowed out with the iron spear point or with a knife, or even with a small stone drill. The hollow shin bones of small buck are also sometimes used, but nowadays the most prevalent form of pipe is an empty cartridge-case! Pipes consisting of an antelope horn were largely used by the Cape Bushmen. Near the point of the horn was made a hole, into which was inserted a reed tube, and on top of this was fitted an elongated clay bowl to hold the tobacco. When these pipes were used, some water was put into the horn, the mouth applied to the large orifice of the horn, and the

FX13 Hottentot
Bushmen FX10

276 smoke sucked through the water by deep breaths into the lungs. A somewhat similar form of pipe is found among the Heikum and the Kung, but apparently water is not used here in smoking. Further [171] east, among the Hiechware, a method of ground-smoking is found similar to that obtaining among the neighbouring Bantu peoples. A small hole is made in the ground, into which the man puts the tobacco; he then inserts his pipe-stick through a small tunnel and smokes.[1]

Dagga is mixed with tobacco or smoked by itself whenever obtainable. The habit is said seriously to affect those addicted to it, both physically and morally. When taken in slight quantities the [164] herb has no visible ill-effects, but excessive indulgence is most deleterious to the health, and if persisted in sometimes causes mental aberration and frenzy.

273 Few of the Bushmen know how to make any kind of liquor themselves. The only exception, perhaps, are the Namib Bushmen, who, [171] after the manner of their Hottentot neighbours, brew a kind of mead out of honey. They are very partial to this drink, which plays an essential part in all their festivities.[2] The other Bushmen in general also do not seem to trade for any liquor, although they all appreciate alcohol and native beer when it is given to them. The Hiechware, [439] however, are said to be excessively fond of native beer, which they obtain by barter from the BeChwana; and, according to Dornan, they contrive to get drunk whenever they can.[3] Drunkenness as a rule is very exceptional among the rest of the Bushmen.

Sexual Life and Marriage

Conditions and Forms of Marriage

114 There is very little information about the relations of the sexes before marriage. Either the subject is not mentioned at all by our 836 authorities, or it is curtly dismissed in a short sentence. Kaufmann, for instance, reports of the Auen merely that prenuptial intercourse hardly ever seems to occur[4]; Lebzelter writes of the Kung that chastity is insisted upon before marriage[5]; while, on the other hand, all Miss Bleek has to say in this connection about the Naron is that

Bushmen FX10

the women told her "a girl may do as she pleases, but a married woman may not".[1] And again Dornan writes of the Hiechware: "Sexual intercourse by the lovers before marriage, though looked upon as wrong, is very often indulged in."[2] Vague generalizations such as these really tell us next to nothing about the nature of sexual life before marriage; they simply ignore the many important sociological problems connected with the whole question of courtship and selection, social attitude towards prenuptial unchastity, legitimacy, and marriage. 114 836

Similarly Trenk says that the girls among the Namib Bushmen are generally virgins when they enter into marriage, because most of them marry soon after puberty.[3] But that premarital unchastity does actually occur is shown by his statement in another context that the children born to an unmarried woman are taken over and looked after by the man she subsequently marries, although as soon as they grow up they must be returned to their real father.[4] This implies that physiological paternity is acknowledged by these Bushmen, and that marriage is not necessary to legalize the status of children. The latter implication at least is at variance with what is known of other Bushmen, and needs to be confirmed. Among the Heikum, for example, abortion is sometimes practised by unmarried women who are pregnant, or, when "illegitimate" (i.e. prenuptial) births occur, the children are usually buried alive.[5] Here, therefore, marriage would seem to be an essential preliminary to the right to procreate and rear children, and therefore to the foundation of the family. [582] 848 [842] [847] [581]

A family is constituted by a union between one man and one or more women, this union being legalized by marriage. The Cape Bushmen are now said to be monogamous,[6] but polygynous marriages also have been recorded by earlier writers.[7] The Namib Bushmen, according to Trenk, are monogamous; Seydel, on the other hand, curtly remarks that both polygyny and polyandry occur![8] There is no other mention of polyandry among any of the Bushmen, and the statement can hardly be accepted as accurate without full confirmation. The more northerly tribes all permit polygyny, although the frequency of such marriages varies. Among the Naron at Sandfontein monogamy 595 [114]

Bushmen FX10

595 is the rule, but a second wife is not considered wrong; it is thought better for a man in such a case to marry the younger sister of his first wife, then the two will not quarrel.[1] Further east in this tribe three or four wives are not infrequent, and actually a man often marries the sisters and "cousins" of his first wife.[2] The Auen at Rietfontein all have only one wife, "because of the scarcity of food," while those at Gam on the average have two, and sometimes even five wives. The wife first married holds a higher social position than the rest, which may, however, says Kaufmann, be due merely to her greater age.[3] Among the Kung a second wife may be taken, if the first consents; but owing to the difficulty of providing for more than one wife, adds Lebzelter, polygynous marriages are extremely rare.[4] Of the Heikum, again, Fourie tells us that each man as a rule has two wives, who may or may not be related. The second wife is married some time after the first, who is looked upon as the principal wife and exercises a certain amount of authority over her. Each wife has a hut of her own. The husband lives with the principal wife, and visits the second only for purposes of cohabitation.[5] Polygynous marriages are also found among the !O Kung of Angola and among the Hiechware, but are here said to be comparatively rare.[6]

The occurrence of such marriages implies a numerical [114] preponderance of women, or else that some of the men must remain [162] bachelors; but unfortunately in no instance are figures given to show the proportion of men and women, or even of monogamous and polygynous marriages, within the band. The motives for polygyny are also not clearly defined. We are told, however, that [622] chiefs among the Naron mostly had two wives,[7] so that here it may be [554] partly associated with rank; while among the Auen, and probably also among the Heikum, the second wife is often not taken until the first is old and past child-bearing. A similar statement is made by Barrow about the Cape Bushmen.[8] In such cases naturally only the older men have more than one wife.

The Cape and the Namib Bushmen, as previously mentioned, are 582 said to forbid marriage only between own brother and sister, parent and child; and so do the !O Kung of Angola. Beyond this no special prohibition or injunction appears to exist. Among the Heikum, on the other hand, the range of forbidden relatives is extended to include all cousins and nieces; while in all the North-Western tribes, including

584 The account given by Fourie of the Heikum marriage ceremonies
[114] is fuller than most of the others, and may be quoted for the sake of the details it contains.[1] "A young man eligible for marriage is known as a */gari-khoib*. When he desires to marry he first speaks about the matter to his best friend (*/hosab*), who then approaches the parents of the prospective bride. The latter will reply: 'We are poor, we cannot afford to give our daughter away.' Thereupon the */hosab* returns to the suitor and tells him to go and speak to the mother himself. The suitor then proceeds to the *//gaus* of the girl's mother, taking his bow and arrows with him. On arrival at her hut he sits down some distance away and says 'I want your daughter'. The mother replies, 'We are too poor to give our daughter away,' to which the suitor responds, 'I have come myself to speak to you. If you die, I will bury you, if your husband dies I will bury him,' thereby implying that he has become one of the family and prepared to share their sorrows and sufferings. The mother then replies, 'You are right, you may take her. I will do as you say and see whether you will carry out your
585 promises,' and taking his bow and arrows, proceeds to her daughter's hut (*/gari-khois oms*) and places them in the hut. Then, without speaking to her daughter, she returns to her own hut. The daughter knows to whom the bow and arrows belong. The suitor goes to the girl's hut towards dusk but does not speak to her. Being still shy and afraid of men, she may run away, but does not go to her mother's hut as she is afraid of being punished. He remains in the */gari-khois oms*, sleeping in it at night and hunting during the day. If, after two or three days, she does not come back he returns to his *//gaus* and, after obtaining some beadwork from his mother and sister, presents it to his mother-in-law through his sister. He returns to his bride's hut in the meantime. The mother-in-law must accept the present (*//ama-xun*) as the marriage was completed when she took his bow and arrows and placed them in her daughter's hut. Towards midnight the mother takes her daughter to the */gari-khois oms*, and, if necessary, removes her there by force. The bride and bridegroom do not speak to each other, nor, under normal circumstances, are the presents sent to her mother until they have slept together. After the marriage has been consummated the husband goes out hunting to obtain an animal for the */gu-ʃa-ʃnab*, or the dance after an animal was killed for the purpose of making a wife's leather skirt. The young
591 couple continue to live in the */gari-khois oms* for some months before

837 with the woman who becomes his wife; at the same time it is the duty of a married man to avoid sexual relations with women, whether 684 married or unmarried, other than his wife or wives. Marital infidelity appears to be severely condemned by all the Bushmen. Among the Naron, for example, a man who catches his wife misconducting herself tries to kill her lover and beats her, but he generally does not drive her away if she has children.[1] Marital fidelity among the Auen is said to be fairly well maintained. When adultery does occur, the adulterer is, if possible, killed, while the wife is more or less severely beaten, according to the temper of the husband; she is apparently never killed. Kauffman adds that there nevertheless appears to [548] exist a form of prostitution in which a married woman offers herself to different men for gifts, although if this comes to the notice of the husband he will drive her away. Our author finds it difficult to reconcile this with the blood vengeance exercised in case of adultery, but adds the explanation given him by the people, that "if a woman is intimate with many men, the husband can hardly wage 'war' with them all".[2] Of the Kung Lebzelter says merely that the adulterer is killed, and the guilty wife thrashed.[3] Among the Namib Bushmen, again, an adulterer can either be killed or forced to pay compensation. We are not told, however, the circumstances under which one alternative is exercised rather than the other, nor in what the compensation consists. The wife is sent away, and the adulterer, if unmarried, is then expected to marry her. If she is pregnant the child [848] must be reared by him, and sent back when grown up to the original husband.[4]

114 684 In all these cases, it will be noticed, we have to deal with generalized statements. In no instance is any concrete illustration given of what actually took place in such cases of adultery as may have come under the observation of our authorities. It is not possible, therefore, to decide how much truth really underlies the statements that the adulterer is generally killed. It is evident, however, that the sexual prerogatives conferred by marriage are jealously guarded. Unfortunately almost all the information bearing on this point refers

Bushmen FX10

only to the treatment of women and their paramours; nothing is said of the wife's remedies when her husband is unfaithful. 114 684

Besides this sexual relation between husband and wife, there is also the economic relation. The two share the same hut, and take their meals in common. It is the duty of the wife to build the hut, to provide the vegetable food, the firewood and water, and to cook the meals; while it is the duty of the husband to provide game for himself and his wife, to make her clothes and certain of her utensils. The economic burden of the woman has led some writers to depreciate her status, but on the whole it would seem that the women are the companions of their husbands, not their servants, and will often take their own way, in spite of the man's wishes. The position of the wife within the household is, in fact, hardly inferior to that of her husband, who, it is said, is often enough henpecked by her![1] 581 [264] [462] 562 593

In addition to establishing this special relationship between husband and wife, marriage leads also to the formation of further special relationships, especially with the parents-in-law. After marriage, as we have seen, the young couple may remain for some time with the wife's parents before finally taking up their residence in the husband's group. Among the Kung and the neighbouring tribes to the east the husband has during this period of temporary matrilocal residence to hunt for his parents-in-law and to supply them in this way with animal food. If he neglects to do this, says Vedder, his wife may be taken away from him.[2] We thus get a special economic relationship between a man and his wife's parents, based directly upon the fact of his marriage. Probably something similar exists among the other Bushman tribes having temporary matrilocal residence, but no concrete information is available about them in this connection. 591 606 [583]

Among almost all the Bushmen, moreover, marriage further creates a special form of etiquette between a man and his parents-in-law, and in some cases between a woman and her husband's parents. Thus among the Kung the husband has to avoid his mother-in-law, the wife apparently also her father-in-law. The wife's parents do not enter the hut of the young couple, nor again may the husband enter their hut. The game which he kills for his father-in-law he lays down in front of the latter's hut.[3] Similarly among the Naron a man is not 606

606 supposed to speak to his wife's mother, nor a woman to her husband's father. Of the former Miss Bleek had personal evidence, since her [114] Bushman kitchen boy would not enter a room in which his mother-in-law happened to be. Actually it seems that sitting near or consorting together is avoided, rather than the actual addressing of the person concerned.[1] So, too, among the Auen a man avoids the company of his mother-in-law and does not sit together with her. If he approaches a fire in order to sit there, she gets up and goes away; if he wants to speak to her, he must do so from a distance.[2] Among the Heikum, again, as we have seen, a young couple who are visiting the wife's parents will erect their hut on the opposite side of the camp, so that the husband may not be too near his parents-in-law. He neither looks at nor speaks to his wife's mother, nor will he mention her name or enter her hut even in case of sickness or during her absence. When she is away and he wishes to speak to anybody in her hut, he will keep at a distance and depart as soon as he sees her approaching. They never [60] refer to each other by name, but always as "my son-in-law" or "my mother-in-law". The son-in-law also does not associate with his father-in-law, but avoids him in the same way. Should they meet accidentally, they may exchange greetings, but no general conversation will take place, nor will they look each other in the face.[3] A similar avoidance of the parents-in-law among the Cape Bushmen is indicated in one of the texts obtained by Bleek and Lloyd, but no details are given.[4]

Dissolution of Marriage

586 The duration of married life varies. Among the Naron, says Miss Bleek, "One sees couples who have grown old together, on the other hand one hears of cases of desertion on either side. If there are no children, no one worries about it. If there are youngsters, the relations try to bring the parents to reason." Where separation does take place, the children belong to the father; an unweaned child must go with the mother, but the father can claim it later if he likes. [587] People who have separated are not ostracized, but both parties generally marry again.[5] No indication is given of the grounds for separation. Among the Auen divorce is rare, and only takes place

Bushmen FX10

when the wife is too old; she may then simply be sent back to her 586
people. Generally, however, she stays with her husband, who then
takes a second wife, younger and more active. The children of a [595]
divorced woman remain with their father, and are brought up by his new wife.[1] Among the Heikum separation of husband and wife may take place under various circumstances, as when the woman is childless, but this, says Fourie, is entirely a matter for adjustment between them. The wife on separation returns to her own group; the present made to her mother at marriage is not returned to the husband. The children are looked upon as belonging to the father, but if husband and wife should separate the girls, according to Fourie, are taken by the father and the sons by the mother.[2] This statement runs counter to those given above about what happens in the other [114] ●
North-Western tribes under similar circumstances, and is almost certainly inaccurate.

Among the Namib Bushmen divorce may result only from barrenness or adultery, and is at the discretion of the husband. If he decides to separate from his wife, he brings her back to her parents. The mature children remain with him, while the youngsters who have to go with their mother also come to him when grown up. After divorce both parties are at liberty to marry again as soon as they wish.[3]

Marriage is, of course, also dissolved by the death of either husband 587
or wife. As a rule the survivor may remarry. Among the Bushmen
of Basutoland, however, a widow is said to have found it difficult [589]
to get a second husband, owing perhaps, writes Arbousset,[4] to the [754]
popular belief that most of the deaths which occurred were due to [761]
witchcraft rather than disease. On the other hand, great attention was paid to her in the camp, where no piece of game was ever eaten without her having a share.

Further north this fear of marriage with a widow is not found. [184]
Among the Naron she may, if she likes, marry her late husband's
brother, but need not necessarily do so; she is quite at liberty to marry another man. If she remarries, and if young enough most
widows do so, her new husband is expected to look after the children; [736]
otherwise the duty falls upon their father's brother. An unmarried widow may stay near her late husband's people, or return to her own
group, as she pleases.[5] Widows among the Auen may also marry 587

184 During her seclusion a row of small parallel cuts, which are all
304 blackened with ashes, is made on her face, or arms, or legs by her
881 father or a male magician. Miss Bleek is convinced that these cuts are partly for ornament, but adds that there also appears to be a
[776] religious element present, as one woman informant said that *//gäüa*, a supernatural personage, leads this dance, and that the cuts are made in his honour.[1] Both the scarifications and the presence of a supernatural being are foreign to the puberty ceremonies for girls in other Bushman tribes; but, as will be seen shortly, both occur (in somewhat different form) in the puberty ceremonies for boys among the North-Western tribes.

184 In all the ceremonies so far described, girls are required to pass
881 through the rites individually as soon as they have their first period. Among the Hiechware of the Eastern Kalahari, however, it appears from the very fragmentary data supplied by Dornan that girls are initiated in groups. The central feature of the ceremony, as described
[304] by him, is an operation performed on each of the girls, which consists in the "perforation of the clitoris" (*sic*) with a stone knife, the operators being the older women.[2] If this information be correct,
[177] we have here a ceremony in every way distinct from those of the other Bushmen, and one which can only be regarded as having been borrowed from the neighbouring BeChwana, whose puberty ceremonies for girls are of a somewhat similar nature.

Boys' Puberty Ceremonies

881 Boys are subjected to the ceremony of initiation after reaching the age of puberty, and as soon as they are considered to have become proficient in hunting, especially in the pursuit of big game. Among the North-Western tribes this ceremony is carried out in a secluded spot in the bush, near which no woman may come.[3] Here all the eligible big boys from several neighbouring encampments are taken
[756] by the old men, with a couple of magicians in charge; and here they remain for about a month, living together in a big hut or enclosure. During the first few days they are roughly handled and half-starved;

[1] D. F. Bleek, "Buschmänner von Angola," 51; *idem*, "Bushmen of Central Angola," 122.
[2] Dornan, *Pygmies and Bushmen*, 159.
[3] Passarge, op. cit., 100–1; Kaufmann, op. cit., 157; D. F. Bleek, *The Naron*, 23–5; *idem*,
[114] "Buschmänner von Angola," 122; *idem*, "Bushmen of Central Angola," 51; Fourie, op. cit., 91–2. Passarge states that the ceremony takes place during the dry season, i.e. at the coldest time of the year; Fourie, on the other hand, that it is always held during the rainy season, when food is plentiful. The other writers do not mention the time of year.

2: Schapera E-4, 5 (no date)1930
FX13 Hottentot
Bushmen FX10

304 The only other Bushman people among whom the occurrence of
881 initiation rites for boys is definitely recorded are the Hiechware of the Eastern Kalahari. Here the main element seems to be circumcision. "The boys," according to Dornan,[1] "are operated on at the age of twelve years, all those of the same age being taken together once a year, as with them puberty comes on at an early age . . . (Then follows a description of the operation: the foreskin of the boy is seized by the operator, who pulls it forward over the gland as far as it will stretch, and then cuts it off close with one slash of a stone knife.) . . . They
881 are treated with considerable care for two or three weeks afterwards, and are fed upon meat . . . They are instructed in the traditional lore of the people, the religious observances and into the mysteries of generation. They are carefully informed that intercourse of
[834] uncircumcized people is that of the beasts of the field, that in short it is fornication, as well as a good deal that will not bear to be put into print."

114 Although, as already mentioned, Dornan regards circumcision
304 as an original Bushman custom, there can be little doubt that the
177 Hiechware have taken it over from the BeChwana among whom they live. They are the only Bushman people among whom this practice is
184 asserted to occur, while its absence from other Bushman tribes is explicitly affirmed by all writers. Consequently the puberty rites in the form described by Dornan must be regarded as introduced elements of culture. It is conceivable that the boys' puberty rites among the North-Western tribes should also be attributed to Bantu influence, since nothing similar to them appears to exist in the south. But in several of their details, especially in the introduction of the tribal deities and in the form of mutilation these rites differ considerably from the corresponding rites of the neighbouring South-Western and South-Central Bantu, while on the other hand they are intimately connected with both the economic activities and the religious beliefs of the Bushmen. It is difficult therefore to imagine their having been borrowed, unless it is conceded that they have undergone considerable modification in the process of adaptation. But whether borrowed or not—and the possibility of borrowing, although difficult to establish, is not entirely eliminated—these rites clearly separate the North-Western tribes from their Southern relatives in at least one important feature of culture.

[1] Op. cit., 158–60.

Bushmen FX10

278 transported. When wanted for use, the insect inside is rubbed to powder on a half tortoise-shell, then mixed with the juice obtained either from the spiked cucumber (*Citrullus caffer*) or from the 'hakdoorn' (*Zizyphus mucronata*). They heat the cucumber root in the ashes, knock it on the ground, then wring out the liquid it contains. The bark of the 'hakdoorn' is chewed, and the juice spat into the dish of poison. This juice is clear, bitter, and sticky and adheres to the arrow point, on to which it is dabbed with a flattened stick after being mixed with the poison. The poisonous matter becomes very hard and dry and is apt to fly off into the eyes if the arrow is carelessly handled. Bushmen always warn one of this and say the eyes become much inflamed if even a tiny grain of dried poison gets into them." Any mixture left over is wound round a stick and carried with the arrows in the long bag; presumably it must be heated again if it is to be put on to further arrow-heads.[1]

114 There does not appear to be any sort of ceremonial attaching to the process of preparing the poison, nor is the work of doing so the 278 function of any particular person. There are, indeed, one or two hints at something of this kind, but nothing which can be regarded as fully reliable.[2] All our principal authorities state that in general any man who needs poison prepares it for himself when he wants it.[3]

224 None of the Bushman poisons is instantaneous in its effect, although as a rule the smaller the animal the quicker the action. Generally 278 the wounded animal runs on as if unhurt, and the hunter follows on its spoor until he finds the dead body; sometimes this is within half an hour, sometimes many hours elapse before the poison proves effective, and often enough it is not till the next day that he can obtain his meat. That the poison is fatal once it gets to the blood, cannot be doubted. Once the arrow pierces the skin of the animal the Bushman has no fear that it may escape him; it may travel perhaps forty or more miles after being wounded, but its progress becomes slower and weaker, until finally it falls down dead.

411 In addition to bows and arrows, the Northern tribes also make use in hunting of throwing-sticks ("knob kirris") and spears. The former is a round-headed stick of hard wood, usually *Acacia*, about [412] two feet in length, and pointed at the lower end to serve also as a digging-stick. It is used for knocking down birds and small mammals,

[1] D. F. Bleek, *Naron*, 14.
[2] These statements are summarised by Schapera, op. cit., 206.

FX13 Hottentot
Bushmen FX10

and in minor quarrels it is the weapon of offence or defence. The 411
spears have long wooden shafts and an iron head about six inches long. The latter is obtained by barter from the neighbouring Bantu, [439]
but the spear itself is made by the Bushmen. For the shaft they pierce the end of a stick, then heat the tang of the iron head in the fire and insert it, binding the joint tightly with sinew.[1] Relatively few of the men possess these spears, and as they do not appear ever to have been [177]
used by the Southern Bushmen they can safely be regarded as weapons borrowed from the Bantu.

Methods of Hunting

The Bushmen, as already indicated, have a variety of devices for 224
catching game, the particular method employed being determined by the nature of the intended prey and the season of the year.[2] In some cases the animals are run down on foot. In this manner, for instance, small buck such as the duiker and steenbok, and even big game such as the gemsbok, are hunted during the "big rainy season" (late summer), when the ground, sodden with moisture, impedes the progress of the animals and causes them to fall an easy prey to the hunter, who on overtaking his quarry kills it with the kirri or the spear. This method cannot be employed for small game during the dry season owing to the difficulty in following the spoor, but in the hot part of the dry season young buck are easily caught in this way, as the hot sand causes the hoofs to come off. Many varieties of big game, such as the wildebeest and zebra, are also run down in the hot dry season. After a herd of game has been located, one or more men give chase at a steady trot. The animal is pursued relentlessly, never once being allowed to rest, until it is exhausted and brought to bay, when the hunter comes up and kills it with the spear.

Burrowing animals, such as the spring hare (jerboa) and anteater, are caught in their holes by means of a long barbed stick. This is poked down the hole into the animal's flesh, either to drag it out or to transfix it while another man digs down to it. Snakes are sometimes caught in the same manner. The man who pulls out the snake runs fast, dragging it after him, while others throw kirris and spears at it; this cannot be done in grass or the snake may escape. Steenbok,

Bushmen FX10

of boys at the puberty ceremonies are also said to have the function of making them "see better" in hunting.[1] Seydel briefly mentions the existence of similar practices among the Namib Bushmen. Cuts are made on the forehead or upper arm of a man in order that he may have better fortune in hunting. These cuts are made by a near relative of his, such as father, brother, or wife, and are given only to adults.[2] 224 304

There is no record of such scarifications among the Cape Bushmen, although here also a well-developed ritual existed in connection with hunting life. Unfortunately, only fragments of this have been recorded. They show that there were certain special precautions to be observed before going out on the hunt, and especially during that critical period when the game has been wounded but not yet taken. Thus, when an animal has been wounded, the flesh of the swift springbok may not be eaten by the hunter, as this would give strength to the movements of the wounded buck; he should rather eat the flesh of a slow-moving animal, especially of such as would strengthen the action of the poison. The moon must not be looked upon when following the spoor, lest the animal run too far—a belief also held by the Naron. The hunter's shadow, again, must not be allowed to fall upon game which lies dying; certain (unspecified) rules have to be observed when an eland has been shot; the bones of the dead animal must be treated in a certain way; Bushman girls perform special ceremonies, in order that their father's dogs may hunt well, while certain cuts must be made upon the bow when a baboon or hyena has been killed. Unfortunate shots are believed to be due to such causes as the children at home playing on a man's bed, and are also ascribed to the remissness of wives, while there even appears to be a belief that unsuccessful hunting may forebode evil to the hunter. Also it is held that after the death of a companion the hunters will be unlucky in springbok hunting, and certain (unspecified) remedial measures are resorted to.[3] [184] 224 [114]

Beliefs of a somewhat similar nature are found among the Heikum. As we have already seen, the meat of an animal killed with the bow and arrow is subject to minutely-prescribed rules of division and preparation. Moreover, a man who shoots an eland or giraffe must, on

Bushmen FX10

finds expression in the numerous observances and beliefs developed in relation to the sources of water, and especially to the rain. Here, however, we may note how the Bushmen cope in practice with this ever-present problem. 182 312 823

Caches of ostrich egg-shells containing water are often buried in the ground or hidden in a tree for future use, and to steal them is one of the greatest offences in Bushmen life. When even these have given out, a substitute is found in various succulent plants, especially the *Inaras* and the *tsama*, which contain enough moisture to relieve thirst and which are still available for the first part of the dry season. In some parts of the Kalahari water may still be found below the surface at this time, and to obtain it the people make use of an ingenious filter. A hole is dug in the sand where the green colour of the grass indicates the presence of the subterranean water, and with a reed tube to the lower end of which is attached a bundle of grass they painfully suck out drop by drop the water that has collected below, then carefully transfer it to the egg-shell bottles. But when even this resource fails them, they are compelled to make hurried marches back to the permanent waterholes, to which they cling until the coming of the rainy season again enables them to move out into the sand veld and resume their normal hunting life.[1] 312 [685] [824] [271] [221]

Industries and Trade

Industries

Besides their food, which they must find from day to day, the Bushmen have need of little but their weapons and utensils. Their household possessions are few, for they seldom own more than they can conveniently carry about with them, and all their industries are essentially domestic.[2] 511

From wood they make their huts, the staves of their bows and spears, quivers for their arrows, digging-, throwing-, and firesticks, the long barbed stick used for catching spring hares and other burrowing animals, the poison sticks on which the arrow poison is gathered in lumps after it has been prepared, the spits (sometimes 322 [342] [411] [412]

[1] Livingstone, *Missionary Travels*, 51; Chapman, *Travels in S. Africa*, ii, 297; Passarge, *Buschmänner*, 51, 70–1, and fig.; Schultze, *Aus Namaland und Kalahari*, 671–3; Seiner, "Bereisung der Omaheke," 293–4.

[2] The most comprehensive account of Bushman industries is to be found in Gretschel, "Die Buschmannsammlung Hannemann," *Jb. städt. Mus. Vkde. Leipzig*, v (1911–12), 89–113, pl. xxiii–xxix, which relates chiefly to the Auen; cf. also van Rippen, "Notes on Some Bushman Implements"; Stow, *Native Races of S. Africa*, 62–80; Passarge, op. cit., 81–94; Gentz, "Beiträge zur Kenntnis der südwestafrikanischen Völkerschaften," 297–301; Kaufmann, op. cit., 152–3; Schultze, op. cit., 658 sqq.; Werner, "Ueber die Heikum- und Kungbuschileute," 257; D. F. Bleek, *Naron*, 8–18 *passim*; Fourie, "Bushmen of S.W.A.," 103. [114]

Bushmen FX10

made by themselves, and metal pots, spear heads, knives, trade beads, 438
etc., which they obtain through the Heikum from the OvaKwangari 439
and MaMbukushu further north. The Naron to the east trade their skins, and formerly also ivory and ostrich feathers, with the BaTawana to the north-east for tobacco and millet. Ostrich egg-shell beads are bartered to the Bantu by all the Bushman tribes. The Koon at Naosanabis in the south, a branch of the /nu//en, are known to make them especially well, and their beads are always in great demand, passing through the Naron and the Auen to the Bantu tribes further north and east, who pay highly for them. For a chain of these beads passing round the waist the MaMbukushu, for example, give a large basket of millet, the BaTawana a large roll of tobacco, the OvaMbo an iron spear head, and so on. The Naron also trade their skins to Europeans and BeChwana for tobacco, dagga, or trade goods, and the latter, again, they pass on to the Auen.

The extensive scale on which this trade is carried out would seem to imply the existence of regulated trading communications between the different tribes. Unfortunately, there is extremely little information bearing on this point. Markets are apparently not held, the transfer [443]
of goods, as far as can be determined, being effected almost entirely through special trading visits from one group to another. Kaufmann 437
describes the way in which such trading visits are conducted among the Auen. A small number of men and women go to the camp of the band with whom they wish to trade, laying down their weapons beforehand. Permission to enter is then given, and the barter proceeds. He adds that even if two bands are at enmity, as often happens, [114] ●
women will, nevertheless, go from one to the other in order to trade. This statement, however, needs to be confirmed. Passarge also suggests that the Bantu tribes of this region probably send periodical trading caravans to the different Bushman tribes, and quotes as an illustration the fact that in former times at least the OvaMbo would, with the permission of the Bushmen, go on special trading visits to obtain copper in the Otavi district of South-West Africa.

Property and Inheritance

The economic life of the band, although in effect it approaches a 421
sort of communism, is really based on the notion of private property.[1] The only thing owned in common is the land, and even here, as we 423

FX13 Hottentot
Bushmen FX10

among the Namib Bushmen the victim may take back not only the 627
stolen property, but also all the thief's possessions. That blood 685
vengeance is actually exercised in case of theft appears from the following incident recorded by Miss Bleek. An Auen man had a good 628
deal of tobacco, most of which he hid in a tree. Returning later he 685
found the tobacco gone, and human footprints round the tree. He followed the spoor to one of a cluster of huts, where he saw a Bushman sitting at the fire cutting the stolen tobacco. Although he had only a spear with him, he darted up and stabbed the thief to death. The man's wife, intervening, was also stabbed. Then the assailant tried to escape, but was shot in the side by a poisoned arrow from the group round the next fire. He succeeded in reaching his home, but died of the poison a few days later. Similarly, in the waterless regions of the Namib Desert, men on the hunt often store up supplies of water in ostrich egg-shells and also of meat. Another person coming upon this supply may take from it, but must follow the spoor of the owner, tell him about it, and recompense him. If this is not done the owner, when he discovers the loss, will follow the spoor of the thief until he finds him and will then kill him if he can.

Here, according to Trenk, homicide in case of theft and adultery 114
is apparently not regarded as murder, but as punishment, and the 628
relatives of the deceased may not take blood vengeance. But, as 682
shown in the instance quoted from Miss Bleek, among other Bushmen [184]
homicide, whether deliberate or accidental, leads inevitably to blood vengeance, the relatives of the dead man combining to kill the murderer. This appears also from another instance recorded by 627
Knudsen.[1] A Bushman, not far from Bethanie in South-West Africa, 682
shot another in the leg with an arrow during a honey beer drinking-bout. The wounded man revenged himself on the spot by shooting his assailant in the heart and killing him. The dead man's brother pursued the killer, who fled, but could not overtake him, and so returned to the camp, where he met the man's wife carrying a child. He tore it from her, threw it up in the air and caught it on the point of his spear. The mother saved herself by fleeing, but two other women

still living, she may be handed over to them and they all have to leave the camp. Should the father be dead and the mother alive, the thief is still taken and given back to the latter, after the stolen property has been recovered. But, if she is an old offender, the mother is said to give her, through a son, to another person, to be burned to death. These facts, obtained from a single young informant, need, however, to be confirmed. The deliberate burning to death of people, for whatever reason, is not reported of any of the other Bushmen.

FX13 Hottentot
Bushmen FX10

judge, the head of the band, but in cases of murder, bodily injury 622
resulting in death, and treason the latter is assisted by another man. 692
The judges can invite or summon witnesses, and after coming to a [695]
decision announce it in the presence of all the members of the band.
Murder is punished by death, the sentence being executed by the 681
relatives of the dead man, who kill his slayer with the kirri or by stoning him; treason is also punished by death, and so, in former times, was adultery, although nowadays the adulterer is merely beaten very severely. Theft, the concealment of stolen property, assaults leading to bodily injury, and offences against morality are punished by thrashing. Attempted crimes as well as aiding and abetting receive the same punishment as the accomplished deed, but self-defence is in no way penalized.

How far this description can be accepted as entirely accurate is 114
difficult to say, since Trenk in discussing the legal usages of these 692
Bushmen makes no mention of such a form of procedure. There is 681
no reason, however, to dismiss it as improbable, since the Nama [171]
Hottentots, under whose influence the Namib Bushmen have come to a very large extent, have a more elaborate legal system along the same lines, and the Bushman procedure may well have been imitated from this. There is nothing, as far as our present information goes, [184]
to suggest the existence of such an organized procedure in any of the other Bushman tribes.

Relations with Other Bands

619
Each band, as has been shown, has its own particular hunting 621
territory, and in general the members of the band keep within their own bounds. But people of neighbouring bands do occasionally have relations with one another. Intermarriage, for example, is a rule among the North-Western tribes, where also a newly-married [591]
man generally remains for some time with his wife's people before returning with her to his own band. Visits are apparently also [574]
frequent between families connected by marriage, and in any case, as we have seen, a woman always goes back to her parents' home for her first confinement. Trading visits, again, are often undertaken from [438]
one band to another, while under special circumstances we may also find the members of several different bands assembled together for a while. It has already been mentioned, for instance, how an outbreak of rinderpest resulting in the death of many cattle drew together

2: Schapera E-4, 5 (no date)1930
FX13 Hottentot
Bushmen FX10

619 621 Bushmen from all parts of the Ghansiveld, even from different tribes, owing to the abundance of animal food thus provided. And again [221] [423] Passarge states that in the Central Kalahari there are also common hunting grounds in which during the rainy season members not only of different bands but also of several different tribes may be found hunting together peacefully, although at other times of the year each band carefully avoids going beyond its own area.

114 619 621 All this suggests that there must be some sort of machinery, however imperfect or ill-organized, to regulate social contacts between different bands. Unfortunately the information bearing upon this most important point is so inadequate that it is extremely difficult to determine to what extent the bands are socially interrelated. There are indeed one or two hints of common meetings at special times for ceremonial purposes. Thus Kaufmann, in describing the boys' [881] puberty ceremonies among the Auen, states that the initiates are drawn together from several neighbouring villages,[1] while Lebzelter, in his preliminary account of the Kung, makes the tantalizingly brief statement [574] that in the months of March and April different bands come together for great feasts.[2] Occasionally, again, a weaker band may seek and 726 obtain assistance from a stronger neighbour. Thus the men of several 619 Auen bands united with some Naron to attack another Auen band, 621 although once the fight was over the alliance was dissolved.[3] Such alliances are never of a binding or permanent nature, nor does it appear that the different bands of the same tribe are commonly organized together for political purposes. But the occurrence of such interrelations as have just been noted definitely indicates that there must be some form of regulated intercourse between neighbouring bands. Without further research in the field, however, no additional light can be thrown upon the nature and mechanisms of this intercourse.

578 619 621 628 On the other hand, the relations between neighbouring bands are not always friendly. Homicide, trespass, theft, adultery and wife-stealing give rise to quarrels and conflicts which generally assume the form of a blood feud and may even lead to war.[4] Trespass especially [685] is a frequent cause of dispute, as all the Bushmen readily attack those who 648 encroach on their land. This applies not only to other Bushmen,

campaign is brought to an end among the Auen by agreement, The 628
unarmed negotiators passing freely between the two groups, and an 727
indemnity is paid to the victors in the form of women, material 728
objects, and food. There is no information relating to peace-making
in other tribes, and even Kaufmann's statement about the Auen lacks [114]
corroboration.

FX13 Hottentot
Bushmen FX10

766 others are usually abandoned before they die, and the whole camp wanders in the bush.[1]

888 There is also the well-authenticated fact that old people are sometimes deliberately abandoned. When drought and scarcity force the Bushmen to a long hurried march, some old man or woman may be too feeble to keep up with them. They then make a screen of bushes all round the old person, provide a good supply of firewood and a little food and water if possible, and push on, leaving him behind. Should game and water be found within a couple of days' march, some young fellow is sent hurrying back with supplies. Otherwise they do not come near the place again, knowing that the end must have come and hyenas dealt with the remains. This abandonment of the aged has often been characterized as an inhuman trait in the Bushmen; but when the life of the whole band depends upon rapid movement it is difficult to see how they could act otherwise. Anyone who falls out and dies on such a march will have to [766] go unburied too, and probably the same fate overtakes those killed [727] in war.[2]

● 114 Where burial does take place it follows almost immediately after the death. The descriptions available of the actual funeral ceremonies 764 of the Bushmen are far from being exhaustive, and naturally vary somewhat in detail, but a certain degree of uniformity may be noted. The information relating to the Southern tribes is fragmentary. Skeletons of these Bushmen are found buried both in caves and in graves out in the open, but of the customs associated with burial we have very little record. The fullest description is that given by Arbousset of the Basutoland Bushmen. He states that a dead 764 person first has his head anointed with red powder (*buchu*), mixed with melted fat. The corpse is then rudely perfumed (*grossièrement parfumée*), and laid on its side in an oblong grave, to which all the relatives and friends hasten to make their lamentations. They come even from the neighbouring villages to see and examine the body, which is then taken out of the grave; and everybody redoubles his cries and lamentations. At last they throw into the grave the hut of the dead person, and burn it above him. The grave is then filled in with earth to the level of the ground, but no heap of stones is [768] piled above it. The funeral over, the band leaves the place for a

Bushmen FX10

year or two, during which the dead person is never spoken of but 768
with veneration and tears.[1]

Several details in this account—the anointing, perfuming, and 114 ●
examination of the body, as well as the burning of the hut—are not 764
met with in the descriptions of other independent observers, who as a rule remark merely that the corpse is buried with all its possessions and the place then deserted.[2] On the other hand, it is certain that many of the Southern Bushmen heaped stones on the graves of their dead. This custom may have originated merely from the desire to protect the body from the ravages of hyenas and other wild animals. It has, however, sometimes been given a religious significance owing to the fact, recorded by several of the older observers, that passing [769] natives would always add a branch or a stone to the heap. It is 114 unfortunately not always possible to gather whether the natives 764 referred to were Bushmen or Hottentots. The latter certainly have 769 various practices and beliefs connected with these grave heaps, of 171 which the usage just mentioned is one of the most common, but there is no fully reliable evidence of anything similar being observed by the Southern Bushmen.

In excavated graves the corpse is sometimes found lying on its 764 left side, with one or two large flat stones placed directly upon it. The interest attaching to these "burial stones" lies in the fact that in a few cases, in association with cave burials along the south coast, [532] they have been found with figures of human beings painted upon them in the typical Bushman style. It would be unprofitable to speculate upon the significance of such stones, as there is no record of any Bushmen having explained them to our authorities; but that they were related to some definite belief can hardly be doubted.[3]

The Namib Bushmen, according to Seydel, as a rule bury a dead person on the morning following his death, and in any case not before the death has been confirmed by the nearest neighbours. [763] The relatives of the dead man and the neighbours accompany the corpse to the grave, uttering or singing a funeral dirge. The grave

[2] Campbell, *Missionary Travels in S. Africa*, 440; Barrow, *Travels in S. Africa*, i, 289; Fritsch, *Drei Jahre in Südafrika*, 242. The account given by Hahn (op. cit., 121) is obviously derived from Arbousset; that in Stow (op. cit., 126–9) from Arbousset, Campbell and Sparrman. The English translation of Arbousset (p. 365) renders "grossièrement parfumée" as "coarsely embalmed", which, as it is repeated in Stow, may have given rise to some misconception. There is nothing in the nature of real embalming among the Bushmen.

Bushmen FX10

764 often done, as they dislike touching or interfering in any way with a corpse, owing to the fear of bad luck." After the funeral 765 they usually indulge in a funeral feast, then desert the locality, and [768] never mention the dead person's name afterwards. "That they are much affected by death is certain, for they often weep at such times, especially if the deceased be a person of some importance, and bitterly lament his departure from amongst them." Signs of mourning are infrequent. Sometimes they paint their faces with white and black stripes as a sign that they have had a death in their encampment; and Dornan adds that he has heard of their painting the whole body with red and white stripes, but has never himself seen any thus decorated.[1]

Beliefs Concerning the Dead

All the accounts given above are admittedly inadequate. They 114 agree, however, in stating that the dead person is buried in a con- 764 tracted position with all his possessions, and in implying the absence 768 of any elaborate and prolonged funeral ceremony and rites of mourning. No attempt appears to have been made to ascertain what explanation the Bushmen themselves have to offer for burying the dead person with all his possessions, except only in the case of the Kung, of whom we are told by Lebzelter that their reason for placing these objects in the grave is not that the dead person may be able to use them in the future world, but because people do not want to make any further use of objects belonging to a person whom they loved while he was alive.[2]

All the descriptions of the funeral ceremonies of the Bushmen [769] point also to a vague fear of the dead person, expressed most forcibly in the fact that after the funeral the place is abandoned and perhaps never revisited. What belief underlies this fear, and what the Bushmen 775 hold to be the fate of the dead, are not always easy to determine. Stow mentions the belief, reported to him of some Southern Bushmen, that at some undefined spot on the banks of the Orange River there is a place called *'too'ga*, to which after death they will all go; and [304] that to ensure a safe journey there they all cut off the joint of the little finger of one hand. "This they consider is a guarantee that they will be able to arrive there without difficulty, and that upon their arrival they will be feasted with locusts and honey, while those who have neglected this rite will have to travel there upon their

2: Schapera E-4, 5 (no date)1930
FX13 Hottentot
Bushmen FX10

heads, beset the entire distance with all kinds of imaginary obstacles 775
and difficulties; and even after all their labour on arriving at the desired destination they will have nothing but flies to live upon." This belief that after a time the dead arise and go to a land where there is an abundance of good food is likewise recorded by Campbell [114] and by Miss Currle, neither of whom, however, is a specially trustworthy authority. The Bushman informants of Dr. Bleek also spoke of "the place to which the Bushmen go after death", but unfortunately the details given by them have not yet been published. We are unable, therefore, to tell if their ideas of a future life were in any way similar to those reported by Stow and the other writers.[1]

On the other hand, these Bushman informants also had a variety 821
of interesting beliefs linking up death with the phenomena of Nature. 761
The stars, they said, know the time when a Bushman dies, and the 775
fall of one announces, to those who are not aware of it, that something bad has happened. When, after this, a "hammerkop" (*Scopus umbretta*, the "lightning bird" of other South African tribes) flies, [825] calling out, over the camp, the people know that someone belonging to them has died. When rain is accompanied by lightning, girls who are out in the open become killed by the lightning and are converted into stars, while those who are taken away by the rain become beautiful water-flowers, which will not allow themselves to be plucked [824] and disappear when approached. Such flowers must be let alone. Hence the rule that young unmarried women and girls must hide themselves from the rain. The Moon, again, is hollow (in its first quarter) because it is carrying people who are dead. The human heart is believed to fall down after death in the form of a shooting star; the hair of a dead person is changed into clouds, while his gall appears again as a green colour in the sky, and so forth. Dead 775
people may also come in their own forms as apparitions to their relatives and friends, even in waking life. There seems, however, to be no evil portent in this; nor, indeed, does there seem to be any noticeable fear of dead persons on the whole, although we are told that the names of those who are dead must not be uttered by children at night.[2]

The Namib Bushmen, on the other hand, seem to fear dead people greatly, and, as we have seen, the thickened *dawes* sap placed in the [764]

[1] Stow, op. cit., 129; Campbell, *Second Journey in S. Africa*, i, 29; Currle, "Bushmen of Namaqualand," 117; Bleek, *Bushman Texts*, 19.
[2] Lloyd, *Bushman Material Collected*, 21, 25; Bleek and Lloyd, op. cit., 365–71, 389–401.

775 hands of the corpse at burial is meant to conciliate his soul. Trenk
[764] says they believe only in an "evil spirit", which they fear, but he
[776] throws no light upon the nature of this spirit. He adds, however, that, according to them, the souls of the dead fly about in the air and also speak to people, yet remain unseen, except by children, to whom they often show themselves in ghostlike animal forms of oxen, horses, or gemsbok.[1]

761 Of the tribes further north our information is somewhat more precise. Kaufmann, as we have seen, maintains that the Auen distinguish between those who die "good deaths" and those who die "bad deaths", and he adds that the latter are feared also after death. This distinction was not found by Miss Bleek among the Naron at Sandfontein, but is also reported by Fourie of the partly-disorganized Auen and Naron groups of the same district. He says
764 they believe in a "good being" named */khutse* and a "bad being"
775 named *Gaua*. People who die a "good death" are said to go to
[776] */khutse*, those dying a "bad death" to *Gaua*. The former have a
[761] good time and live in plenty; the latter, on the other hand, often suffer hunger and distress. A deceased person is believed to move about in the form of a ghost at night. "*Buchu* is accordingly sprinkled over the grave to make the spirit of the departed happy, so that it may not return at night to molest others; further, water is poured over or left at the grave in order that the spirit may not interfere with the rain, and the bow, quiver, and arrows of the deceased placed at the graveside to obviate the necessity of his ghost returning to look for them." These usages are no doubt part of
[114] the funeral ceremony, but the context in which they are described does not make this clear.[2]

775 The word *Gaua*, or, more correctly, *//gāũa* or *//gāuwa*, which
[192] Fourie interprets as a "bad being" or "Satan", is, according to
[776] Miss Bleek, also used by the Auen and Naron in the sense of a "person
[114] who has died". Her male informants said that all people who die
[791] become *//gāuwa*, and the magicians can see them. The women, however, affirmed that only men who have been cut between the eyebrows (at the puberty ceremonies) become *//gāuwa*, and only such men can see them, though women sometimes hear them. "They evidently mean ghosts," comments Miss Bleek, "and have much the same vague fear of them as European peasants have. The ghosts

FX13 Hottentot
Bushmen FX10

walk at night and people are afraid of them, but they do not expect 775
real harm from them. If seen, the apparitions resemble people."[1]

The same word was given three meanings by some Kung youths [192]
from near Lake Ngami—"dream, ghost, spirit." It is met with again among the !O Kung of Angola, by whom it is sometimes used for "ghost", sometimes more impersonally. Miss Bleek was told by one of her female informants that when a person dies there rises from the grave the ghost, *//gāũa*, which can be seen by magicians. This woman claimed to be a magician, and said that she and her co- [789]
workers could conjure up *//gāũa* by dancing and singing. In what form he appeared and whether she looked on the apparition as the spirit of the departed, or as some other spirit, she did not say. Another woman's death was described as follows: "She died, became a ghost, people saw the ghost, it went away and stayed in the bush."[2]

A good deal of new information on this subject is contained in [114]
the reports recently published by Lebzelter on his researches among the Kung and the Heikum.[3] The Eastern Kung, he says, believe that the vital principle ("Lebensprinzip") of a man is his soul, *xa*, which is immortal. When a man dies, this soul is fetched by the spirits, *//Gauab*, whose hearth fires are the stars, and is taken by them [776]
to the sky hut ("Himmelshaus") of the "great captain" *Xu*. This hut has two storeys, in the upper of which dwell the souls of all people, including even those of the whites. They do nothing there and also eat nothing. The body is buried, but after a few days the flesh becomes "alive" and then disappears: out of it has arisen the *//gauab* of the dead person, in the form of a smaller image or "shade" which issues from the grave, hunts, eats, and drinks just as in life, and when tired goes to sleep in its house, the grave. These shades cannot enter into or transform themselves into stones, plants, or animals; apparently they retain the human form only. The Kung of the Oschimpoloveld, again, believe that every man has a soul, */gau-ba*, which after death comes into the "house of God" (*Erob*) in the sky. Dead people are therefore now the people who are with "God", and after a while "God" again makes living beings out of them.

Among the Heikum of the Etosha Pan the soul, *darish*, goes up [776]
into the sky to */Gamab*, a "demiurge", who places the heart in cold water and eats it.

spirit remains active about the place, and they do not want to offend it."[1] 775 769

The conflicting accounts of Dornan's informants as to the fate of the dead can be harmonized if we assume, in the light of Lebzelter's statements about the Kung and the Heikum, that these Eastern Kalahari Bushmen also distinguish between the soul and the ghost; but since there is nothing in Dornan's remarks to indicate definitely the existence of such a distinction, the assumption here made must be regarded as purely speculative. It will be noticed, further, that he describes here the practice of throwing a small stone on the grave in order to appease the spirit of the dead person. This practice, as we have already noted, has sometimes been said to exist among the Southern Bushmen also. Unfortunately it is not always possible to determine how far Dornan has recorded what are actually his own observations, for much in his book has obviously been inspired by the accounts of earlier writers on the Bushmen generally. What he has to say here must therefore also be received with caution, and cannot without further inquiry be accepted as an independent confirmation. 114 775 769 [184]

It appears on the whole that, among all the Bushmen, people are believed to continue their existence after death, sometimes in their own form, sometimes in another form, and may even manifest themselves to the living. There is also a vague, ill-defined fear of the dead person's haunting the living, but it would seem that as a rule no great harm is expected from this, although, as we shall see later, most of the North-Western tribes attribute sickness to the spirits of the dead. Another fact that emerges very prominently is the apparent absence of any organized cult of the dead as such—there seems to be nothing in the way of ancestor-worship, nor of any other form of religious practice in which the spirits of the dead are regularly invoked or propitiated. The only concrete mention there is of dead people being prayed to refers to the Cape Bushmen. One of Miss Lloyd's informants stated that his father asked a certain dead magician for rain, which speedily followed; while another mentioned a prayer addressed by his mother to a dead magician who had power over game, in order that her husband's hunting might prove more fortunate.[2] The details given in both instances are too scanty to afford much basis for speculation, but can hardly be interpreted as implying more than that in certain cases dead magicians would be 775 [753] [769] 114 184 769 789

Bushmen FX10

114 184 769 789 [775] asked to make use of the special powers they had possessed in life and apparently still retained, just as they would be approached when alive. The main conclusion to be drawn, in fact, is that these Bushmen do not regard dead people as wholly severed from the world of the living. There is certainly nothing here to warrant the assumption of any regular organized worship of the dead.

Worship of Heavenly Bodies

782 821 [794] Religious cult among the Cape Bushmen centres largely in the worship of the Heavenly Bodies, and especially of the Moon. Prayers directed by them to the Moon have been recorded in the texts collected by Bleek and Lloyd, but unfortunately the details given are far too [114] scanty to throw much light upon the nature of the worship. One account, indeed, indicates that when the New Moon first appears every man prays to it, and Orpen also mentions having seen Bushmen throw sand in the air and shout out on seeing the crescent moon when it first appeared, but there is nothing else to suggest any special form of rite. The prayers themselves are chiefly prayers for food, and one of them, just lately published by Miss Bleek,[1] may be quoted as illustrating the form of invocation. It is spoken with raised right hand :—

539 782 821

Ho, my hand is this,
I shoot a springbok with my hand
By an arrow.

I lie down,
I will early kill a springbok
To-morrow.

Ho, Moon lying there,
Let me kill a springbok
To-morrow,
Let me eat a springbok;
With this arrow
Let me shoot a springbok
With this arrow;
Let me eat a springbok,
Let me eat filling my body
In the night which is here,
Let me fill my body.

Ho Moon lying there,
I dig out ants' food
To-morrow,
Let me eat it.

Ho Moon lying there,
I kill an ostrich to-morrow
With this arrow.

Bushmen FX10

or other worship directed to these bodies.[1] How far the absence of moon worship must be attributed to the fact that these Bushmen have long been exposed to Bantu influence is difficult to say. In view of the comparative evidence afforded by the other Bushman tribes, however, as well as the fact that the Hiechware have certainly been considerably influenced by the BeChwana, this seems the most reasonable suggestion; although, as already noted, Dornan cannot be regarded as a fully reliable authority. 821 [782] [177] [114]

The evidence on the whole shows quite definitely that worship of the heavenly bodies, and especially of the Moon, exists among the Bushmen. In all the instances noted, the New Moon is prayed to; in the case of the Cape Bushmen for food, although the details of the ceremony are not available, while among the Naron, Auen, and !O Kung there is a special ceremony at which it is invoked for rain. There is nothing to suggest that the Moon is conceived of as a supreme deity, or that it forms the object of an elaborate cult. At the same time the prayers and ceremonies noted clearly constitute an act of worship. They must therefore be regarded as part of the Bushman religion. The prayers and usages relating to the sun and the stars among the Cape Bushmen suggest a wider sidereal worship, which the scanty details from the Northern tribes would seem to bear out; but the worship of the Moon seems to be by far the most prominent. 821 771 782 [776]

Supernatural Beings

In other aspects of religion and mythology there appears to be a good deal of variation in details among the different Bushmen tribes. The most prominent figure in the mythology of the Cape Bushmen is the Mantis, round whom a whole cycle of myths has been formed. Besides his own proper name, */kaggen*, he possesses several others, as does also his wife, whose most usual name, however, is */huntu!katt!katten*, the Dassie or Rock Rabbit (*Hyrax capensis*). They have three children, a daughter, of whom there is no further mention; a son, */gaunu-ts'axau* (*!gaunu* is the name of a certain star, and *ts'axau* means "eye"), who in one of the tales is killed by baboons, and restored to life again by the Mantis; and another son, */kaggen-ɔpwa*, the young Mantis, who also figures in one of the tales, where his likeness to his father is commented upon. Besides his own children the Mantis has an adopted daughter, */xo*, the Porcupine. 773 776 [184] [825] [825]

2: Schapera E-4, 5 (no date)1930
FX13 Hottentot
Bushmen FX10

Ko('ngo), as

776 we have already seen, comes sometimes to the people while they are
[787] dancing, and informs them where game is to be procured; while
[224] if she breathes upon a man's arm this makes him shoot better.[1]

From these accounts we may gather that the Mantis among the Basutoland Bushmen is regarded as the creator of all things, and is
[782] especially concerned with the sources of food supply, so that prayers are addressed to him for food, for success in hunting, etc. He is also linked up with certain dances in some way connected with
[756] initiation, although, from the description given by Orpen's informant,
[791] it is probable that the "initiated" men referred to are the magicians, who are also the physicians in all Bushman tribes. The tales recorded
[773] by Orpen show that the Mantis here has much the same mythological character as among the Cape Bushmen. The latter, however, do
[184] not pray to him, although by them also he is said to have creative powers and to have made certain game animals which are under his special protection.

Further north there are no particular beliefs about the Mantis.
184 Some Kung youths from near Lake Ngami, however, repeated to
776 Miss Lloyd several tales about */xwe*, a little personage not identified with any animal, who plays tricks and transforms himself into a variety of things. */xwe* also has some dealings with the Moon and the Hare, outstanding figures of Bushman lore. He seems to have much in common with the Mantis, but there is no further mention of him in the other branches of the Kung or in any of the other North-Western tribes.[2]

776 The Naron and Auen at Sandfontein spoke to Miss Bleek about *Hishe* or *Hiyesha*, a supernatural being who lived in the east, and who, as we have already seen, appears in various guises at the boys'
[881] puberty ceremonies. He is regarded as the protector of the game and hunting; he once, when the trees and animals were people, bade them assume their present forms; he also instituted marriage and the mode of life of the Bushmen, Hottentots, and Europeans.
[756] From a casual reference by Miss Bleek it further appears that the magicians "worked" with Hishe, but unfortunately she throws
[114] no light at all upon the meaning of this statement.

From the Hottentots these people were beginning to borrow the
177 idea of */khuba* or */xuba* (cf. Campbell's "Goba"). This is the

Bushmen FX10

Nama word for "master, lord", and has been used by some 177
missionaries for "God". The Naron and Auen were vague as to 776
the nature of */khuba*. The old men did not know of him; the middle-aged men said *Hishe* was */khuba*; while some of the younger people said he was the sky, others that he dwelt in the sky; they prayed to him to let them live long and to make them well when ill. Women who when young had been kidnapped and held as slaves by Nama chiefs were very fluent on the subject of */khuba*; the others, [648] remarks Miss Bleek, had evidently picked up the word without [567] attaching any clear meaning to it, beyond that it was some sort of deity and that it was "good to pray to it". The same word (given by him in its vocative form */khutse*) was also found among the partly-disorganized groups of these Bushmen by Fourie, who translates it "God".

A few of Miss Bleek's informants further mentioned *Huwu* or 776
Huwuba, but they did not know much about him—he was the "captain" of the men in the north, the Makoba and others. They also said he was the brother of *Hishe*, while one man called him the [177] "captain" of the white people.[1]

Huwu or *Hu'e* figures very prominently among the Kung, however. [184] Miss Lloyd's young informants from near Lake Ngami only once mentioned him. They began the tale of the Moon and the Hare [773] with the words, *Huwe* made all things; and in explanation said, *Huwe* made all things to eat (i.e. all animals that are eaten), and *Huwe* is a man.[2] Vedder, who studied the Kung at Tsumeb, much further west, speaks of *Huwe* as a "good being", to whom the people attribute the creation and maintenance of all things. They pray to [792] him for food, as we have already seen, at a special ceremony held [796] once a year when the edible bulbs of the veld are beginning to ripen, and they also in case of sickness call upon him to restore them to [755] health.[3]

Lebzelter, in his account of Kung religion, says that all the groups investigated by him have the belief in a "supreme good being" ("ein höchstes gutes Wesen"). Among the Eastern Kung this being is termed *Xu* (elsewhere he spells the name *//Khu*)[4] or *Xuwa*,

[1] D. F. Bleek, *Naron*, 24–6; Fourie, "Bushmen of S.W.A.," 104.
[2] Quoted in D. F. Bleek, "Bushmen of Central Angola," 123.
[3] "Grammatik der !Kû-Buschmannsprache," 6–7.
[4] It may be mentioned here that Lebzelter is inconsistent in the orthography he employs: */Kuś* is elsewhere written *//Khun*, *//gauab* alternates with */gauab*, *gagorob* with *//gau //gorob*, and so on. [114]

FX13 Hottentot
Bushmen FX10

everywhere he is regarded as the creator of all things, including mankind, and he sends the rain. He is prayed to for rain, in sickness, before and after hunting, and before travel, and by the group at Uukualuthi he is also given the first-offerings of the chase, as among the Kung of the Oschimpoloveld. Almost everywhere he has neither wife nor children; it is only among the Eastern Kung that mention is made of these. He is regarded everywhere as benevolent and good, but appears to have no connection with the moral life of the people.[1] 184 776 [821] [782] [224]

The ǀO Kung in Angola did not mention *Erob* or *Xuwa*, but spoke again of *Huwe*. Here, as we have seen, *Huwe* occasionally appears at the boys' puberty ceremonies and dances with the initiates, sometimes as a youth, sometimes in double guise as man and woman. In the prayer to the New Moon his name may also be substituted for *//nwa-se*, but apart from this substitution there is no evidence of worship directed towards him. He is further said to appear to people in dreams.[2] Of the attributes found by Lebzelter for the "supreme being" among the Kung and the Heikum no mention at all is made by Miss Bleek. [787]

Huwe appears again among the Bushmen of the Eastern Kalahari. They believe, according to Dornan, in a spirit which they variously call *Dǂimo*, *Thora*, and *Huwe*. *Dǂimo* is a corruption of the Chwana word *Modimo*, nowadays generally rendered "God", and is, says Dornan, "largely used by the tame Bushmen with the same signification." *Thora* and *Huwe* are the regular Bushman words. *Huwe* is here spoken of as the good spirit who wards off disease, gives plenty, and protects the Bushmen from danger. When any danger threatens, they will call upon him; Dornan mentions having once heard some Bushmen of the Sansokwe River sing over and over again the words *Huwe ka hume ie ie*, *Huwe* come to our aid ie ie. More often, however, they speak of *Thora*. They say he made all things, but they are not sure where he dwells, or if he is a person. According to Dornan they look upon him as the Great One, who is over all things, who sends rain and game, plenty of food and good luck in hunting. They often use *Thora* to ensure success in hunting; when, e.g. they have killed an animal they will praise him for bringing it under their arrows. This statement Dornan seems to have derived [177] [782] 114 776 224 [821]

[1] Lebzelter, op. cit., 410–12; cf. Schmidt, "Die alten Buschmann-Religion," 197, summarizing Lebzelter's data.

2: Schapera E-4, 5 (no date)1930
FX13 Hottentot
Bushmen FX10

114 776 [224] from Chapman, who records that once when some Bushmen were with him and he had killed a rhinoceros they threw some dust on its tail and spat in its eyes before they touched it, muttering meanwhile "some gibberish" to *Thora*, while on another occasion when he had killed some elephants a similar performance was again enacted by his Bushman attendants.

The distinction between *Thora* and *Huwe* is not quite clear from Dornan's account. In one place he seems to imply that the two words refer to the same conception. Elsewhere, however, he remarks: "Huwe seems an inferior kind of spirit to Thora, for at times the latter is invoked to come to his aid, as if the former were not powerful enough to defend himself and his children. Some Bushmen near the Tuli River sang the following words, in an agitated and melancholy [539] voice: 'Thora ba Huwe i-e i-e, Thora come to the help of Huwe [782] i-e i-e,' ad lib." From their attributes, however, it seems that the two conceptions *Thora* and *Huwe* are substantially the same. In all probability the name *Huwe* has drifted in from the west, which would explain why it is sometimes substituted for *Thora*, sometimes found alongside it.[1]

192 821 In addition to this being variously named *Hishe*, *Huwe*, *Xu*, *Erob*, *Thora*, etc., all the Northern Bushmen also speak of *//gauwa* (*Gaua*, [776] *//gaua*, *//gauab*, etc.). This word, as we have already seen, is used [184] by the North-Western Bushmen for "a person who has died", or [775] more precisely, as appears in certain cases, for the ghost of a dead person. It is, however, also used with a much wider application. Among the Naron and Auen at Sandfontein the wind is called *//gauwa* when it is strong and howls. One of the Naron tales recorded by Miss Bleek speaks of the wind as a man going about, and of *//gauwa* as a bird accompanying him. "*//gauwa* says: 'I make the wind and thus go.'" Some of the people seemed to believe in a supreme 192 776 *//gauwa*, a being who lives in the east near *Hishe*, to whose house the ghosts repair by day. They said he was *Hishe's* younger brother, 114 while others said *//gauwa* was *Hishe*. Miss Bleek affirms that no ideas of good or bad qualities are connected with either of these beings, nor are they prayed to. Fourie, however, speaks of *Gaua* among the partly-disorganized Auen and Naron as a "bad being" or "Satan", to whom people dying a "bad death" are said to go,

[1] Dornan, op. cit., 148–50; Chapman, *Travels in S. Africa*, i, 386, 81. The translation given by Dornan of the prayer in which *Thora* is asked to come to the aid of *Huwe* cannot be relied upon. In another place (*J.R. Anthrop. Inst.*, 1917, p. 53) he renders the same words: "God leave (us) alone ie ie!"

2: Schapera E-4, 5 (no date) 1930
FX13 Hottentot
Bushmen FX10

while those dying a "good death" go to *!khutse* (*!khuba*). "About the nature of these beings," he adds, "they have no idea, nor are their lives and activities influenced to any extent by them." But he records a tale in which the knowledge of magic by the Bushmen is ascribed to *Gaua*, who initiated one of them "on the other side" into the use of the small magic quiver (cf. below "Magic and Magicians"), while in his description of the boys' puberty ceremonies he speaks as if *Gaua* were the supernatural being figuring in them, whereas Miss Bleek's informants all mentioned *Hishe*.[1]

Vedder, again, says of the Kung at Tsumeb that they believe in *//gaua*, who is opposed to *Huwe*, and from whom they expect only evil. They protect themselves against him by means of amulets. The !O Kung of Angola ascribe thunder and lightning to *//gaua*. When it thunders, they say "*//gaua* thunders", and when anyone is struck by lightning, a frequent occurrence, the death is related in the words: "*//gaua* took him or her." Two aunts of Miss Bleek's informant who had been killed by lightning were said to sit in the sky as stars. All stars are called *//gaua's* fires; there do not seem to be any separate names for them. *//gaua* also leads the people at a girl's puberty dance, and the cuts made on the girl's body are said to be in his honour. The same informant, a female magician, said that the Bushmen were *//gaua's* children. He is a male being who comes in from the forest, where his dwelling is a hole in the ground, and magicians can see it from afar. But people do not pray to him. This was also stated by a male informant, who said *//gaua* was *Ndzambi* (the Mbunda word for deity, used by the missionaries for "God"); "we pray to sun, moon, and stars," he added, "but not to *//gaua*."[2]

Much new light is thrown upon the conception of *//gaua* by Lebzelter's accounts of the spirit world among the Kung and the Heikum. Among the Eastern Kung, he says, the "great captain" *Xu* is also the lord of all the spirits, *//gauab*, to whom he entrusts all dealings with mankind, except in the matter of rain, over which he himself directly presides. These spirits affect human life both helpfully and harmfully. They can be seen and spoken to by the magicians, and look like men, but many of them are lame. They are not classified systematically by the Kung, but Lebzelter claims to recognize five kinds.

[1] D. F. Bleek, *Naron*, 26, 46; Fourie, "Bushmen of S.W.A.," 104.

2: Schapera E-4, 5 (no date)1930
FX13 Hottentot
Bushmen FX10

184 776 Bushmen of the Orange Free State, where, as we have seen, Campbell [192] mentions that the spirits attendant upon *Ko* (the Mantis) are called *Gauna*, and that after *Ko* has disappeared from the dance in which she was taking part, "her nymphs" also come and dance for a while. Nothing more is said about them, however.[1]

114 776 The problem now arises as to the real nature of these beings. The information relating to them is sometimes vague, sometimes inconsistent, and at all times obviously inadequate. No interpretation of their nature can therefore be regarded as fully reliable until it has been confirmed by a much more careful and detailed study in the field than has yet been made of the beliefs and usages connected with them. Moreover, as we shall see subsequently, the conception 171 776 of *//gaua* also figures prominently among the Hottentots and Bergdama, whose religious beliefs and practices in general offer other features of resemblance to those of the Bushmen. A comparison of the Bushman concepts on the one hand and those of the Hottentots and Bergdama on the other, may thus succeed in throwing further light upon the problem, the final consideration of which may therefore be delayed until the religions of these peoples have also been passed in review.

177 776 Certain points arise, however, which may at once be dealt with. The notions of *!khuba* among the Naron and Auen, and of *Dʒimo* among the Hiechware, may be set aside in the attempt to ascertain the real nature of Bushman religious conceptions. They have admittedly been taken over from other peoples, the former from the Nama, the latter from the BeChwana. *Erob*, mentioned by Lebzelter [797] as the name for the "Supreme Being" among the Western Kung and certain of the Heikum, is simply a corruption of the word *Elob*, from the Hebrew *Elohim*, which has been used by many missionaries among the Nama as a translation for "God".[2] Its occurrence among these Bushmen is therefore an obvious indication of Christian influence, entering either directly through the missionaries or, more probably, through contact with the Nama; and in this connection it must be remembered that almost all the Heikum now speak only

[1] *Second Journey into S. Africa*, ii, 31–2.

[2] Pater Schmidt, in accepting Lebzelter's data as convincing evidence for the existence of a Supreme Being among the Bushmen, remarks about *Erob* ("Die alte Buschmann-Religion," 397, n. 4): "Wenn er christlichen Ursprungs sein soll, von Elob, aus Elohim, so darf man fragen, warum das Inlaut -*l* in *r* übergegangen wäre." To this it may be replied that the sound *l* does not occur at all in Nama, save in a few words taken over from European languages, and that in most borrowed words where it does occur the Nama form of the word replaces it by *r*. The transmutation of *Elob* into *Erob* therefore follows a definite law of phonetic change in Nama. Cf. on this point Meinhof, *Lehrbuch der Nama-Sprache*, pp. 18–19.

2: Schapera E-4, 5 (no date) 1930
FX13 Hottentot
Bushmen FX10

Nama. Nama influence is seen also in the word *Heiseb* found among the Heikum of the Etosha Pan and of North-East Ondonga. This is one of the names applied to the mythical hero more commonly known as *Heitsi Eibib*, who figures so prominently in the religious system of the Nama. Its absence from the other Bushman tribes is clearly suggestive, although the name *Hishe* found among the Naron and Auen may possibly be a corruption of it. The various current interpretations of *//gaua* as " the evil being ", " the devil " or " Satan " must likewise be dismissed as alien to native Bushman ideas. The word has been widely used by missionaries among the Nama for " Devil ", and there can be little doubt that it is ultimately from this source that such interpretations have been derived. 177 776 [184] [797]

All these direct symptoms of borrowing from other peoples show clearly that the religious conceptions of the Northern Bushmen as recorded above can by no means be regarded as untainted by foreign influences. The final interpretation of these conceptions will therefore have to take into account the religious ideas of the neighbouring peoples as well, especially of the Nama, in order that a full basis for discussion may be obtained. This is all the more necessary since the information relating to them as now held by the Bushmen is hardly sufficient to enable us to determine satisfactorily the full meaning attached to them by the people, to determine, that is, what part they really play in native life. For the moment, however, it may be of service if we attempt to reduce to some order the various accounts given by our authorities of these conceptions. 177 771

A general survey of the attributes said to be vested in the different beings figuring in the religion and mythology of the Northern Bushmen seems to show that on the whole we have to deal with two main conceptions. There is in the first place the conception known variously to the North-Western Bushmen as *Huwe*, *Xu*, *Xuwa*, *Hishe*, or *Erob*, and to the North-Eastern Bushmen as *Thora* or *Huwe*. By Lebzelter, whose account cannot be entirely freed from a suspicion of prejudice in favour of the monotheistic doctrine associated with the name of Pater W. Schmidt and his school of disciples, *Xu* or *Erob* is spoken of as an anthropomorphic " supreme good being " dwelling in a house in the sky, where he receives the souls of the dead. He is regarded as the creator; he controls the rain and its associated phenomena of thunder and lightning, and punishes evil-doers with lightning; he sends good fortune in hunting and in the collection of veldkos, is prayed to before and after hunting, and is 776 [184] [114] [821] [224] [782] [756]

2: Schapera E-4, 5 (no date)1930
FX13 Hottentot
Bushmen FX10

776 honoured with certain ritual observances connected with the chase;
[782] he is also prayed to for rain, before travel, and in case of illness;
[224] and finally it is from him that the magicians obtain their special
[756] powers. By the Eastern Kung he is said to have a wife and many children; among the other Kung and the Heikum he figures alone.

Few of these attributes are mentioned by Miss Bleek in her remarks
184 upon *Hishe* among the Naron and Auen, and upon *Huwe* among the
776 !O !Kung. But there are certain points of agreement. *Hishe* dwells in
[775] a house in the east, to which the ghosts of the dead repair by day;
[224] he is regarded as the creator, and as the protector of game and hunting. On the other hand *Hishe-Huwe*, sometimes alone, sometimes in double
[881] guise as man and woman, sometimes "followed by children like
[114] baboons", figures prominently in the boys' puberty ceremonies, which are not referred to at all by Lebzelter. At the same time, since these ceremonies certainly have much to do with hunting, their association with *Hishe-Huwe* is not inconsistent with his character as protector of the game and hunting, although of course it is hardly likely that this provides the only explanation for his figuring in them. Nor
[782] is he ever prayed to among these tribes, save where the name *Huwe* is substituted by the !O !Kung for *//nwa-se*, the New Moon, in the prayer for rain. Most of the prayers for food and rain, however, are directed to the heavenly bodies, especially the Moon.

A closer agreement with Lebzelter's account is provided by Dornan's
[114] discussion of *Thora-Huwe* among the North-Eastern Bushmen. *Thora* is here said to be the creator who is over all things, he sends
[821] rain and game, plenty of food and good luck in hunting, certain
[224] hunting observances are directed towards him, he wards off disease,
[753] and protects the Bushmen from danger.

It is possible also to find a connection in certain respects between *Huwe* and the conception of the Mantis among the Southern Bushmen. Among the Cape Bushmen, it is true, the Mantis is primarily a mythological character, the central figure of an elaborate series of myths relating to him and his "family". He is never worshipped, but on
[782] the other hand, like *Huwe*, he has creative powers, and is also said to
[825] have made certain bucks and to protect them. Mention is further made by these Bushmen of an afterworld to which go the spirits
[775] of the dead, but there is nothing at all to link this up with the Mantis, just as there is nothing to link up the afterworld of the North-Eastern Bushmen with *Thora*. The resemblance between the Mantis and *Huwe* is far more noticeable among the Bushmen of Basutoland.

2: Schapera E-4, 5 (no date) 1930
FX13 Hottentot
Bushmen FX10

makes thunder and lightning, the stars are his fire, and he kills people 184
by means of shooting stars. Finally, among the Eastern Kung, 776
/nawa or the chief of the *//gauab* figures as the creator, and, as the [821]
executive of *Xu*, he is the source of good luck in hunting and is [224]
honoured with the first-offerings of the chase and prayers for success; [782]
he is also, however, most frequently the cause of illness. It seems [753]
extremely probable that in all these cases the conceptions of *Huwe* [178]
on the one hand and of *//gaua* on the other have been blended or
confused; they are sufficiently distinct in other respects to make
this assumption appear not entirely groundless. The same explana- 114
tion may be advanced for the conflicting reports given by Miss Bleek 178
and by Fourie of one important feature in the Auen puberty ceremonies 776
for boys: according to the former, it is *Hishe* who figures in the 881
special dances, while the latter states that this function is fulfilled [184]
by *Gaua*. *//gaua*, it will be remembered, also presides at a girl's
puberty dance among the !O Kung. Whether we have here a similar
confusion is uncertain, since in none of the other Bushman tribes do
the supernatural beings figure in these ceremonies for girls. But a
suggestion that this may be the case is conveyed by the fact that
one of Miss Bleek's informants identified *//gaua* with *Ndzambi*,
the Mbunda (Bantu) word for deity, used by the missionaries for
"God", while another spoke of *//gaua* as the "father" of the
Bushmen.

We are left, therefore, with the conception of *Huwe*, *Thora*, or 184
the Mantis (among the Basutoland Bushmen) as the creator, the 776
source of the beneficent rain and of good luck in hunting and food [224]
gathering, and the protector of his people from illness and danger; [753]
and with the conception of *//gaua* first as the ghosts of the dead [821]
and then as a personified being, in both cases the source of illness [775]
and death, inflicted in the latter case through the medium of thunder,
lightning, shooting stars, etc. This analysis is not advanced as an
interpretation of the meaning of these beings, nor does it ignore the
possibility of elements having been borrowed from other peoples;
it is intended merely to summarize briefly what appear to be from
the accounts of our authorities the principal religious conceptions
common to most of the Bushmen of the present time.

Magic and Magicians

In all the Bushman tribes people are found who deal in the 756
mysterious or supernatural, who are regarded as endowed with

2: Schapera E-4, 5 (no date)1930
FX13 Hottentot
Bushmen FX10

756 supernatural powers, or who are able to control, either for social purposes or for their own ends, the spiritual forces upon which the social welfare depends. There is no English word which adequately describes them, but such persons may be loosely termed magicians.

Among the Cape Bushmen, these magicians, who might be of either sex, were called */gixa* (plural, */giten*). There is unfortunately [114] no information available as to how they acquired their powers, nor have we any clear description of the part they played in the life of the community. A few details about them may, however, be gathered from the texts collected by Bleek and Lloyd. Some magicians were [821] rainmakers, who went out to catch the rain bull and lead it over the land bringing rain. Others, again, had special powers over particular [825] game animals, such as the springbok or the ostrich. Some magicians were able to assume and go about in the form of animals such as the lion, springbok, jackal, or a little bird; others, even when asleep, knew what was going about at night, and took care of the people, defending them from evil magicians. For some magicians could [757] cause illness by shooting with invisible arrows, and the patients would die, even though doctored; while some were said to eat the flesh of the dead. When a magician died an earthquake took place, [823] and his heart fell, as a shooting star, out of the sky into a waterhole. His powers, however, he continued to possess even after death, [775] for there are mentioned several occasions on which a dead rainmaker was asked to send rain or a game magician to give success in hunting.[1]

These beliefs, fragmentary as they are, show definitely that the magicians were held to possess supernatural powers, which they might use for good or evil; but, apart perhaps from the making of rain, there is nothing to link them up with any cult or public ceremony, or to indicate that they ever played the part of priests.

[184] Among the Naron and Auen, however, the magicians, as we have seen, function at the puberty ceremonies. They introduce *Hishe* [881] into the dances, and make the cuts between the eyebrows of the boys. [793] Among the Naron they are also the priests, who pray to the New Moon for rain; while among the Auen they make rain by sprinkling [821] on the ground a kind of red earth, which they fetch from afar and carry about with them. The magicians, both male and female, are

Bushmen FX10

by *Gaua* 'on the other side' into the use of the small magic quiver. 773
Tji-Tji had killed a gemsbok. *Gaua* arrived on the scene and said, 'I have come to you; you need not be afraid; both of us can sleep here.' After having consumed the animal and slept *Tji-Tji* remarked to *Gaua*, 'Give me that stuff (*//ai*).' The latter replied, 'If I give you the *//ai*, what will you pay me?' *Tji-Tji* answered, 'I will give you the horns.' *Gaua* then took the horns, made the little arrows out of them, invested them with *//ai* and before departing taught *Tji-Tji* the *//ai* dance. From that time the Bushmen have known how to use magic."

The small magic quiver and arrows to which reference is here 754 114 411 756 made are no doubt the miniature weapons found among all the North-Western tribes. In a set seen by the writer the bow, made of a piece of bone, was barely 10 cm. long, and the arrows, for which sharp thorns were used, were small in proportion. Similar arrows [184] described by other writers consisted of a stalk of grass about 6 cm. long and a head of bone or hard wood about 4 cm. long. This head was sharpened at the end inserted into the grass stalk, while the protruding end was blunted.[1]

The range of these arrows is of course very limited, and different suggestions have been put forward as to their use. They are certainly not children's toys, as these miniature bows and arrows are used only by men, who carry them concealed about their persons. From various descriptions it appears that in some cases the arrows are definitely poisoned, and consequently among Germans the name "Bushman revolver" has become applied to these miniature sets. It is claimed that they are used as real weapons and that the poison on the arrow is strong enough to bring about the death of anybody struck by it. On the other hand, Miss Bleek says that among the Naron they are not poisoned, but are used by magicians who quarrel among themselves to settle their differences. "A medicine man wishing to destroy another, comes up close and shoots at the opponent's kaross with one of these arrows, blunt end foremost. The missile falls harmlessly to the ground, but the victim dies of the magic."[2] This statement is supported by the report of a case tried at Windhoek in 1912, where it was maintained, inter alia, that a poisoned arrow of this kind had been used against the accused. In the evidence, however, it was stated by several witnesses that these

114 arrows are not poisoned but are used for "witchcraft", and "if
411 they are shot in the direction of an enemy, be he 100 kilos or more
754 away, witchcraft will bring about his death".[1] The myth recorded
756 by Fourie also lends support to the idea that these arrows are used for magical purposes. It is possible, too, that something similar is implied in the statement, mentioned above, that among the Cape Bushmen magicians caused illness by shooting with invisible arrows, but it should be noted that no such weapons as those here described have yet been found among them.

789 Apart from the special magic practised by magicians and associated with them, there are among all the Bushmen various usages and beliefs of a nature which may be generally termed magical, and which
224 are apparently common property. Many of the hunting observances
787 already described fall into this category. So, too, does divination. Among the Cape Bushmen this occurs principally in the form of
[184] beliefs in the efficacy of omens, of which there are a great number with diverse significations. They say they feel in their bodies that certain things are going to happen; there is a kind of beating of the flesh which tells them things. Those who are stupid do not understand these teachings and disobey them, with the result that they get into trouble, are killed by a lion, and so on. These beatings tell those who understand them which way not to go, and which arrow it is better not to use, and also warn them when people are coming. They inform the hunter when game is close at hand, tell people where they can find the person for whom they are in search, i.e. which way to go, and so on.[2]

184 In the more northerly tribes is found the use of pieces of wood, leather or bone as divining bones or dice. These are usually four
787 in number, and roughly triangular in shape, two of them being broad, the other two longer and thinner. The former are called male, the latter female. In the Eastern Kalahari they are usually each marked in a special way and named, but this is not found further west. The bones may be owned and used by anyone, not only by magicians. They are used in a very crude manner: the inquirer goes on throwing them on to his kaross until he gets a favourable answer. Such bones are frequently found among the Northern and Central Kalahari Bushmen, and occasionally among those dwelling on the southern

borders of the Desert, but are unknown to the Cape Bushmen and 184
those of Griqualand West. Dornan maintains that they are original 787
elements in the culture of the Bushmen, from whom they have been 114
taken over by the Bantu. All the evidence, however, points in 177
the other direction, for among the Bantu the use of divining bones 787
of several different types is not only widespread, but also developed into an elaborate system of interpretation, while the way the Bushmen handle them shows that they do not know much about them. Moreover, it is found that the frequency of their use by the Bushmen coincides with the extent to which any tribe has been exposed to Bantu influence.[1]

Other minor beliefs and practices of the Bushmen are mentioned 751
by writers on particular tribes, but consideration of them must be [184]
omitted in a general survey such as this. It may be noted, however, that among the Northern tribes amulets are often worn to ward off disease and other evils, while among all the Bushmen charms of various [777]
kinds are also carried to ensure good luck. Bad dreams are also 787
regarded as evil omens, and precautions taken to counteract them. 789
Among the Cape Bushmen, for instance, when a woman had had a bad dream, she banished it by plunging a stone into the fire, at the same time saying a spell. If she neglected to do this, the dream would accompany her when she went out to seek ants' larvae and prevent her from finding any. The Naron, in the same way, when they have had bad dreams put a bit of burning charcoal on the ground and pour water on it, then the bad dream flies away with the steam. Or, [755]
when a man is ill and *Hishe* sends bad dreams, he takes a stick after the sun has arisen, plants it in the ground between his knees, burns *buchu* and snuffs it, and recovers.[2]

shoulders, or holding his arms out behind her, without touching her. 535
In other dances the men dance round alone, then approach the line of singers, holding out their arms. The courting motive is clear, 535
though not indecently expressed."[1] Stow, however, describes 831
certain dances of the Southern Bushmen which he stigmatizes as lascivious and orgiastic, and in which, he says, "the women appear to have offered themselves up to sexual congress."[2] There are several suggestions also that the eland bull dance, as well as various others [114]
imitating the sexual life of animals, may assume a pronouncedly erotic character, but these suggestions are conveyed as a rule by our authorities in the form of generalized statements obviously based on hearsay, and lack concrete illustration.

Most of the dances appear to be based on episodes in the lives of 535
wild animals; the dancers imitate the animals, and go through the 825
actions characteristic of them. Several of these dances, observed by Fourie among the Heikum, may serve to illustrate their general character. In the Jackal and Wolf dance, in which only the men take part, a hyena is represented feeding on a carcase and keeping off a couple of hungry jackals. Every now and again, as the latter attempt to approach too close to the carcass, the hyena scares them off and they jump out of the way. The Horse dance is likewise danced by men only, who go round quickly in a circle, while the women clap their hands in imitation of the sound made by a galloping horse. The Gemsbok dance, again, represents a gemsbok bull, cow, and calf being chased by two men with three or four dogs. The bull and cow carry horns but the calf does not. The buck lead and are followed by the men and dogs, who dance to and fro on the flanks until the animals are brought to bay. Then the men pretend to shoot, bows and arrows being represented by sticks, and one of the buck goes down wounded, while the others make off pursued by some of the dogs. The wounded animal fights in realistic fashion, sweeping at both men and dogs with its horns. The dance is continued until all the animals have been accounted for.[3]

Among the Southern Bushmen the dancers often made themselves up to represent various animals, birds, and imaginary monsters, with the aid of either paint or the skins, heads, and horns of the objects to be represented. In many of their dances "they were so dressed as to represent a particular animal, when the dance was called by its name; such was the *t'Gorlo'ka*, the *Man-nia*, or Baboon dance, in

systems.[1] This grouping appears to have been formulated by him without taking into consideration the numerous specimens of the art found in the south-west Cape, and in South-West Africa, and can therefore scarcely be regarded as definitive, but it provides a most useful basis for the archæological study of the paintings and engravings. 172 532 184 [114]

In Southern Rhodesia, according to him, there are three distinct series of paintings, which when found in superposition always occur in the same order. The oldest series are usually coloured a uniform flat red or yellow, occasionally found in outline only, and the figures are "nicely drawn". Certain paintings in a dark brownish-red are slightly more modern, and the style perhaps more developed, but they belong to the same series. The middle series are all in dark claret, and quite different from anything before, not only in colour, but also in style. There is a certain angularity about the figures; the paintings have clean, sharp outlines; the curves and angles of horns and bodies are well and finely drawn, and the style is vigorous and attractive. Finally we get paintings in earthy yellow, white, and the beginnings of polychrome. The style of art is quite different again and much less attractive, the animal figures heavier, the bodies less shapely, and the legs stiffer.

In the Central group the paintings are much more varied, and seem more modern than those in Southern Rhodesia. They are distinguished by wonderful developments of polychrome and the frequent occurrence of elaborate scenes of battles, dances, etc., such as are not found in Southern Rhodesia. Superposition is of much less importance, but it was noted that wherever paintings comparable in colour and style to the 'dark claret' series of Rhodesia occurred in superposition with any other colours or styles they were always undermost and therefore oldest. The rock engravings, which are most frequently met with in the central districts of the Orange Free State and the adjoining northern parts of the Cape lying immediately to the west, also belong to this art group. Its distribution coincides with that of the Upper Smithfield Industry of the Later South African Stone Culture, and the paintings and engravings are always found associated with implements of this Industry.

The Southern art group, again, is invariably associated with the Wilton Industry of the Later South African Stone Culture, which, like the Upper Smithfield Industry, is definitely of Bushman origin. The paintings are here totally dissimilar from and far inferior to those

Bushmen FX10

Knowledge of Disease and Doctoring

164 The Bushmen in their own environment and leading their own mode of life seem on the whole to be a healthy and hardy people. Those communities in the north which have not been much in contact with civilization are said to be remarkably free from infectious, contagious, and other diseases. Except during heavy rainy seasons, when malaria becomes unduly prevalent, the incidence of disease is very small amongst them. Malaria, however, carries off many victims, for the Bushmen do not seem able to withstand it better than other peoples. Kaufmann, as we have seen, records that in 1909 the mortality caused by it was especially high, whole villages dying out, so that the numbers of the Auen were reduced to less than half. Seiner, another trustworthy observer, states that [114] among the Kung fully 20 per cent of the deaths that occur, especially of children, may be attributed to it; and it is officially recorded that in the years 1917, 1923, and 1925 "large numbers" of Bushmen died from it along the north-eastern and eastern borders of South-West Africa. Smallpox, typhoid, dysentery, and phthisis are also mentioned as occurring in these parts, the latter being promoted by [276] excessive indulgence in tobacco and dagga smoking. Where contact [177] with other peoples is frequent, syphilis is often found, as well as measles, influenza, whooping-cough, scarlet fever, and other European diseases. European clothing and dwellings have a bad effect upon the Bushmen. They are particularly susceptible to pulmonary affections when removed from their natural surroundings, and a considerable number of those who have suffered from bronchitis, pneumonia, etc., subsequently succumb to tuberculosis. When [648] imprisoned, as many of them are in South-West Africa for cattle stealing or breaking the game laws, they rapidly decline in strength and die in great numbers, however kindly treated by the gaol authorities.[1]

753 Sickness in most instances is attributed to the non-observance of customary practices on the part of the person affected, to evil magic exercised against him by other persons, to the malicious interference of the ghosts of dead people who send the "spirits of disease" into 000 the patient's body, or to some similar supernatural cause. Treatment

Bushmen FX10

Treatment

is administered by relatives or friends, or in cases of acute and prolonged illness by a magician well versed in medical practices, who is 755
paid for his services. In cases of the latter kind a very common method employed is massage, leading up to the extraction of foreign bodies (" disease-poisons ", " spirits of disease ", etc.) believed to have been introduced into the patient and thus causing his illness. When the " doctor " feels that the foreign body has been brought near enough to the surface by his treatment, he sucks the part affected and then, with a retching sound, triumphantly spits out the object he is supposed to have sucked from the patient's body. Stones, pieces of bark, small bones, etc., are thus extracted from the affected part of the patient, who in consequence is cured ![1] Lebzelter records also that, while the " doctor " is busy performing this cure, the relatives [782]
and friends standing round pray to the " supreme being " to make the patient well again ; and, as we have seen, the use of prayers in case of severe illness is mentioned by several other writers as well.[2]

More practical forms of treatment are also found, however.[3] Herbs 757
and roots of various kinds are extensively employed as medicines. 278
Sometimes they are burned to ashes which are then rubbed into small cuts made in the patient's body, sometimes they are boiled and given as a decoction. How far they actually do have curative effects is difficult to say, as no special study appears to have been made of their pharmacological properties, nor, save in a few instances, have they even been identified. But Dornan mentions that " for blackwater they use a plant called qilika (*Anacoampseros rhodesica*) by the Matabele ; [824]
dysentery *Monsonia ovata*, and *Euclea lanceolata* ; for various other diseases, *Cannabis sativa*, *Solanum nigrum*, *Lippia asperifolia* (malaria), *Cratalaria burkeana*, *Pterocarpus angolensis*, *Datura stramonium*, *Indigofera senegalensis*, and *Bauhinea reticulata* ".[4] Burns, open 752
sores, headaches, etc., are treated by rubbing medicated ointments on the part affected. Chapman describes another method of treatment undergone by himself. " Having a frightful headache from the heat of the sun, I resort to my usual Bushman remedy, at the expense of having my forehead ornamented with blisters dotted all over it the next morning. April [his Bushman guide] has a root

[1] A good eyewitness account of this treatment is given by Schinz, *Deutsch-Südwest-Afrika* ; 340–1 ; cf. also D. F. Bleek, *Naron*, 29. [114]

752 which he puts into the fire, and brands me all over the forehead, heating it again and again. It is the heat of the fire that gives the relief, not the root, nor any of his genuflexions over me."[1] Surgical practice seems to be limited to incisions made in the skin, but Vedder notes that cupping is also employed among the Kung. Incisions are made in the patient's skin and covered with the horn of an animal, through which the blood is then sucked out.[2]

The existence of specific antidotes for arrow poisoning is reported 278 by several of the older writers, but their statements lack confirmation. 752 The effects of such a wound, as far as can be ascertained, are almost [114] invariably fatal.[3] The Naron also have no antidote for snake poison, the effects of which they try to counteract by tying the snake skin round the bite. Kaufmann, however, records that among the Auen the magician makes out of the black mamba, which he alone may eat, an antidote supposed to act against all snake bites except that of the mamba itself. He dries and powders the lungs, gall, and liver, as well as the poison in the fangs, and mixes this powder with the fat of the snake. The salve thus made is rubbed into the wound, which is first sucked out. At the same time several deep cuts are made in the upper arm, from which blood is allowed to stream freely.[4] There is nothing [114] in Kaufmann's account to indicate whether this information is based on personal observation or merely upon hearsay, so that it must be received with caution. Chapman, a careful observer whose hunting expeditions brought him into frequent close contact with the Bushmen in the North-West Kalahari, describes another form of antidote with which he himself saw the Bushmen cure themselves of snake bite. This is a creeping tendrilous plant, called "eokam" by the Bushmen, but unfortunately not identified by him. About eight or ten of its seeds, either eaten or taken as a decoction, act as an emetic. The dose is repeated about three times, when the patient is cured. "They also tattoo and scarify their bodies, and make an incision near the wound, which they suck with some of the root, chewed, in their mouths. This is evidently to prevent the poison acting upon the gums in case of bleeding. The sucking out of the poison is not necessary, but is done by way of precaution. Bushmen having a bit of this root on their necks laugh at snake-bites."[5]

751 Other writers mention that "doctors" sometimes render themselves

immune to the effects of snake and scorpion poison.[1] One of these 751
animals is killed, and its poison, diluted with water and urine, is rubbed in small quantities into small cuts made in the skin, or the poison sacs are pulped and boiled, and then swallowed in small doses. Schinz records an experiment made by himself on a Bushman doctor claiming this immunity.[2] He selected twelve scorpions and placed [114]
them, by means of forceps, on different parts of the man's body—hands, legs, arms, mouth, and testicles. Almost all of them stung the flesh deeply once or twice, in every instance causing a large drop of white matter to appear; then they crawled about leisurely, but made no further attempts at stinging. "The old man maintained that he felt no pain, and I have no reason to distrust him, as he would hardly have allowed himself to be stung by scorpions on the most sensitive parts of his body, merely to satisfy my curiosity, if the poison would have had any effects on him; even a full hour after our attempt the spots where he had been stung showed not the slightest change." This experiment seems therefore to show that there may be some foundation to the claim of immunity. The inoculation was apparently made in this case during the apprenticeship [756]
of the "doctor", under the direction of his master. Our main authorities on the Bushmen do not mention this practice at all, but I have myself spoken to several detribalized Bushmen and Nama in Little Namaqualand who claimed a similar immunity. Unfortunately I neglected to inquire further into the matter, beyond ascertaining the means of immunization.

Knowledge of Times and Seasons

In their system of time-reckoning the Bushmen make use chiefly 805
of meteorological elements, based on recurrent changes in wind and weather, and of astronomical elements, based on observations of the sun, stars, and moon. Their larger divisions of time are the [221]
seasons, which, owing to their effect on the food supply and on the [182]
movements of the people, assume a pronounced importance in Bushman life. The division of the seasons is established by the rainfall. [13]
The Cape Bushmen distinguished four seasons, rendered by Bleek [184]
and Lloyd in the English equivalents of spring, summer, autumn, and winter, but the exact meaning of the native terms is not given.

[2] Op. cit., 395–6.

[1] Introduction

121 The purpose of my expedition, on which I was accompanied by my wife, Maria Lebzelter-Grammetbauer, was to study the anthropology and ethnology of the native tribes, especially of the Bushmen, as well as the archeology of South Africa. The original plan came from Professor Father Dr. Wilhelm Schmidt, S.V.D.
122 Repeated generous stipends from His Holiness Pope Pius XI made possible the continuation of the expedition, which was fostered with tireless zeal by Father Schmidt. The Austrian Government, by means of special administrative measures, made it possible for me to set out on this journey. Furthermore, the editor of Anthropos, Professor Father W. Koppers, repeatedly lent considerable support to the expeditionary fund. The Research Grant Board in Johannesburg granted me -- although for purely anthropological purposes -- a single subvention of 50 pounds.

114 I have already described the program and execution of my South African expedition in the first volume of this work. Here, before presenting the ethnological results, I should like to portray in rough outline how these results were arrived at. I must state in advance that there was a space of only three weeks between the time when the measures taken by the Austrian authorities made it certain that I could leave my homeland and my actual departure. Hence, a
[122] more detailed study of the native languages was out of the question. The conditions under which a person today can do ethnological field work are fundamentally different from those of the pioneering era.
[197] Through the activity of the missions, there is growing up among all
[177] tribes, except for the Bushmen, a stratum of intelligent individuals who, if not in this generation, certainly in the next, will take over
000 the research among their own people. I recall a lawyer's clerk in Natal (Swazi) who had acquired a pamphlet of ethnological lectures from Johannesburg and had learned it by heart. When he turned to a White ethnologist, in order to begin the practical work, the latter assured him that just as a race horse could not be used for plowing, so an ox could not be used for racing. Meanwhile, however, a number of very creditable works by natives have
115 already appeared in print. In my investigations I have always used native schoolteachers who had a command not only of the

[1 cont.]

●115 German or English language, spoken and written, but also of their native tongue in grammar and phonetics.

000 Among the Zulu and Swazi I made my studies more as the occasion arose. Here I was indebted in particular to Father Andreas Ngidi in Inkamana, Princess Maris Dhlamini in Mbabane, and the Italian missionaries in Swaziland for my data. My travels were aided predominantly by the missions. Whereas in the diocese of the Catholic missions of Zululand and Marianhill the main emphasis of the work was upon anthropological and prehistoric matters, in Southwest Africa ethnological studies were the special [121] task of the expedition. Through the kindness of the provicar, 115 Father Schleipen of the Catholic Mission in Windhoek, the schoolteacher Alois Kheibeb was assigned to me, with whose help I came in contact with the old Dama. At the [2] Catholic Mission in Okombahe, Father Bachmann introduced me to the brother of Chief Gottlieb Horeseb, who came with a few other people to tell me stories. In Grootfontein it was Father Jaeger who placed his Dama schoolteacher, Nikolaus Horeseb, at my disposal. I then further succeeded in obtaining a very intelligent !Kung woman, Katiti, who was married to a Hei//om, and this made it possible for me to have verbal contact with the !Kung. In Ovamboland I was able to rely on the generous support of the Finnish Evangelical Mission. Through the help of Mr. Leuch I engaged a respected man from Oshigambo, Erastus Mbumba, who had been a clerk in Swakopmund for 13 years and who spoke superb German. The Bushmen informants in Ovamboland spoke Ovambo. In Epukiro the mission superior, Father Watterott, O.M.J., placed at my disposal the village headman, Franz Arenat, who in turn established contact for me with the Nogau Bushmen. The interpreters [124] have to be paid well. To all those who helped me in my work, I should like at this point to express my heartfelt thanks.

123 In order to achieve genuine success in the ethnological field, it is necessary to gain the confidence and sympathy of the natives and to instill in them the conviction that one has no evil intentions toward them or would want to make them look ridiculous; money alone does not suffice. The relationship between the 648 Whites and Coloreds is of such a kind that the native from the 576 outset faces the White with the greatest distrust. The natives are basically a courteous people, and among themselves they live

[13 cont.]

Chapter 4

The Bushmen of Ukuambi

115 At an outpost of the Finnish Ukuambi Mission, where I undertook anthropological measurements, I encountered a Bushman from the hordes that live on the northern bank of the Etosha Pan and stand in a loose dependent relationship partly with Ipumbo, partly with Shanika. I was able to converse with him only a few hours.

101 These Bushmen in Ukuambi, as well as at other places, belong to the Ezimo of the Akuanambua. They themselves are [614] divided into a number of exogamous kin groups. My informant belonged to the clan Ari-Ari. The tribe calls itself Akese or Kere and comes from the region between Okaukuejo and Outjo. Today this tribal organization is broken up. The following names -- formerly independent hordes which now live mixed together -- were mentioned to me: /Aru-Kwe, Ashuche, Asécha, !Kuru-Kwei, A !Kha-ta-bé, A-Hei-tére, A !gnuri.

648 Insofar as these Bushmen do not already lead the life of the Bantu farmers, they are hunters, spies, and occasionally also executioners for the chiefs. They manufacture ostrich egg beads [+39] and poison. For twelve good ostrich eggs they receive a fat ox. The Ovambo have quite a peculiar outlook in this respect. They spurn the perfectly good eggs of their hens. The ordinarily somewhat "disreputable" ostrich eggs are purchased for dear money as a delicacy.

611 The sons belong to the family of the father, the daughters to that of the mother. The men are not allowed to eat hares, 262 but the women and children do. The eating of hyenas and boa constrictors is prohibited to all.

776 Concerning their religious conceptions I was able to discover the following: In the sky dwells the great captain !Khuwa, which means the same as Huwe. In answer to the question about God, however, he stated that this was Erob, which naturally coincides with the name for God, Ellob, of the Rhenish Mission. The name !Khuwa only occurred casually in the conversation. He was unable to give a clear answer to my question as to whether

Chapter 5

The Bushmen of Uukualuthi

115
[177]

In all Uukualuthi, Uonkolonkathi, and Ombarantu, there are, reportedly, only two Bushmen left who understand the old language. Both of them are good-for-nothing loafers who go from one beer pot to another. Thanks to the kind offices of the missionary, Mrs. Aarni, Chief Moala made one of these men available to me. To be sure, he could not hold out for very long, and during the few days that he devoted to us, he was rarely sober. We had to limit our conversations to the forenoon. What I learned from him is a dying way of life that no longer has any continuity. The man faced the situation with the cheerful resignation of the CHRONIC, GOOD-NATURED IMBIBER...

648 self-reliant. No European farms or institutions such as hospitals, schools, missions, trading posts, labour-recruiting or tax-collecting offices have been established in the Nyae Nyae region. The first government official to go into the region, Mr. Claude McIntyre, Senior Welfare Officer of the Administration of South West Africa, came with our first expedition to Gautscha Pan in 1951. The contact of the /Kung of this region with the neighbouring Bantu-speaking Negro tribes consists of occasional trading trips or visits to their Bushman relatives who are working for Chwana or Herero in western Bechuanaland.

123 We lived for seventeen months with the /Kung of Nyae Nyae; for six weeks in 1951, for fourteen consecutive months in 1952–3, for six weeks again in 1955.

●115 During this time we had several interpreters. We wish to express our gratitude particularly to two, Ngani and Kernel Ledimo, who had an exceptionally intelligent grasp of our purposes and problems and whose work was patient and precise. Ngani (this is his own preferred spelling of his name) is a Heikum Bushman who lived for many years with Mr. Courtney Clark in Grootfontein. Among the nine languages Ngani speaks are /Kung and English. Kernel Ledimo is a Chwana of the Batwana tribe who grew up among /Kung Bushmen on his father's cattle posts and was educated in an English school in Bechuanaland.

121 184 We made the kinship terminology of the /Kung in the Nyae Nyae region a subject of special study. Our investigation of the /Kõ and /Gikwe kinship terminology shows that there is not one system common to all Bushman groups. This paper deals only with the /Kung system.

124 Our method of study was first to take genealogies of the members of six bands, comprising about 175 persons. This took a good deal of time but was rewarding as a background which helped us to place in their web of relationships most of the 600 [123] /Kung in the Nyae Nyae region whom we came eventually to know by sight or name as we travelled about or as they visited us.

124 601 After we had gathered the genealogical material we began to ask people what kinship terms they used for each other. We asked many informants, going over and over the same questions. The terms for parents, offspring, and siblings were easily learned. But the terms for grandparents, grandchildren, and all collaterals threw us into confusion. For each grandparent or grandchild, of either sex, we found that a person might use one of two terms (and one of these has an alternate); and a person might use one of three terms for each collateral, with an alternate, a diminutive, and a distinction man-speaking and woman-speaking to complicate matters. The same term might be applied to relatives on either the paternal or maternal side. We did not know for some time what factor determined, for instance, whether a person applied the term *a* or *b* to his FaFa or MoFa or the term *a*, *b*, or *c* to his FaBr, MoBr or some other collateral. When we asked we were usually told, 'It is our custom', but one informant gravely explained that 'God created people and told them what terms to use for each other. Parents have taught their children ever since what terms to use.' It was ≠Toma, perhaps our most intelligent informant, who at last figured out what it was we did not understand and told us what he had assumed everyone knew, that the term 'followed the name'. In other words there is a factor, which we finally called the factor of the name, which under certain circumstances determines what term the individual uses. We began afresh to gather information to understand and

137 spreading some like the Grewias and the melons whose seeds pass through the alimentary canal apparently unharmed and reducing others like the Eulophias and Vignas which have edible underground storage organs. It is perhaps significant that, with two exceptions, the edible members of the family Asclepiadaceae were rarely found. In this paper there are 11, from Raphionacme to Fockea inclusive—nearly all important food plants with underground storage organs. The two commoner exceptions were *Sarcostemma viminale* which is sometimes poisonous and *Pentarrhinum insipidum* which has edible leaves and fruits but an inedible perennial root.

146 I am not qualified to speak on the health of the Bushmen, but it is apparent even to the layman that they are very unlikely to suffer from any deficiency disease while on their natural diet. When they are recruited for labour and fed on an unbalanced diet their health will be undermined and they will be less able to resist the rigours of their normal life when their contracts expire.

114 Their study by serious workers is to be encouraged for it should lead to their stability as a race and the enrichment of our knowledge, but contacts with irresponsible strangers is unfortunate and observations like the following by Brown (1954: 130) are valueless and regrettable:—

> "They are wonderful runners. When I chased one with the clanging of a bell he set off at a good bat into the distance, and kept it up until out of sight."

122 During the three months in which the field work was done, the expenses of my transport and keep were met from the funds of the expedition, and this I gratefully acknowledge. Dr. R. A. Dyer, Chief of the Division of Botany, gave me the opportunity of joining the expedition, and all facilities for working up the results of the field work. Most of the determinations were done by my colleagues in the Division of Botany, and of them Miss I. C. Verdoorn, author of *Edible Wild Fruits of the Transvaal*, read through the typescript and gave me valuable advice. Dr. L. E. Codd deserves special thanks for the way he saw to the growing of the considerable quantities of roots, bulbs and seeds sent from the Kalahari. 000 I thank Mr. L. K. Marshall, who led the expedition, and the members of it, [115] for their interest and kindness, also Kernel Ledimo, a fluent speaker of the Eastern !khũ language, who was always ready to translate or to pilot me through its little-known and fascinating grammar and phonetics. My notes on the Bushman languages were kindly checked by Prof. L. F. Maingard, and the ethnological literature was supplied mainly by Dr. N. J. van Warmelo of the Department of Native Affairs. I am indebted to Messrs. Midgeley, Martin and Scholtz of the Bechuanaland Administration for hospitality and for enabling me to see parts of the territory that I should not otherwise have seen. My thanks would not be complete without mention of the Bushmen whose knowledge is the foundation of this paper. [124] The information was seldom reluctantly given—usually cheerfully and with humour, and always with intelligence.

13: Marshall E-5 (1952-1955) 1962 FX10 Bushmen FX10
Kung

776 throes, his thrashing and writhing limbs gouged out the omurambas,[1] the putrefaction of his body became the rivers, and his black hair became the rain clouds. But the /Kung, it seems, always thought of their protagonist as man-like in size and appearance. The old ≠*Gao/na* was man-like. ≠*Gao/na*, the great god of the east, is also man-like. He has the power to change himself into the forms of animals or objects and sometimes does so, but in his own form he is a man. The people say he is 'the tallest of the Bushmen'. His bearing, as the people at present imagine him, suggests [115] to me the Tswana or white men, or the tall aggressive Herero. Gao Medicine, Gao Beard, Old Demi, ≠Toma, /Qui, and /Ti/kay told us from time to time how they imagine ≠*Gao/na* to be. He has a big head. He has black hair, but it is long, not twisted and knotted like the Bushman peppercorn, and he has a long beard and hair on his chest (not at all like Bushmen, whose beards and body hair are sparse). Gao Medicine thinks that ≠*Gao/na*'s skin is reddish in colour, */ga*, like Europeans, but others claimed that it is the colour of Bushman skin in its light tones, *gau*. ≠*Gao/na* wears European clothes and a hat. His pants and shirt are white. 'He is the great god and has power over all these things, so he possesses them.' He has a horse and rides everywhere across the earth and sky. You can sometimes hear the sound of his horse's hooves passing overhead. Especially when it rains he goes about a great deal and you can see the tracks of his horse. They are like those of the Hereros' horses, not exceptional in size or form. He has a gun and when he starts out, for instance to visit his */guma* in the west, he shoots it off to let the people know he is passing through, and shoots again when he returns. The shots can be heard by everybody. The bullet which he shoots is named */guri*.

≠*Gao/na* hunts for his own food with his gun or with his bow and arrows, as he pleases. Some informants think that he hunts animals on earth and that he eats earthly veldkos, but has his own supplies of these foods. Others were vague about what kind of food he eats. They know that he and the lesser god and the *//gauwasi* are all very fond of earthly honey and take it whenever they find it. The people all believe that the gods never lack food.

If ≠*Gao/na* hears his name spoken in the daytime and is displeased, he comes down on his horse at sunset and beats stiff dry hides with a stick or snaps an eland-hide reim[2] to make a noise like thunder to frighten all the people.

The majority of our informants held the above beliefs about ≠*Gao/na*, telling us these details from time to time as we sat in groups. Some informants, however, held a different opinion. Several who were working with Robert Dyson in 1951 claimed that ≠*Gao/na* never came to earth. Their old people had told them this, they said. All concurred in the belief that he does not come to the medicine dances.

≠*Gao/na* lives in a house at the place where the sun rises in the eastern sky. Near the house is a great tree—one tree. The /Kung fear the tree and the house, they say. The lesser god in the west lives beside two trees, and these two trees have names. I was repeatedly told that the one tree of the great god in the east had no name. Perhaps, however, it has and the name is one which is really taboo. The tree is associated with the spirits of the dead, as I shall mention later. ≠*Gao/na*'s house has two stories. It is long, made of stone, with a shining roof of corrugated iron. There

[1] Ancient watercourses, now usually dry.

Gam when four bands danced together. Demi was the smallest Bushman we had 776
seen in the region. He was bedecked with many beads and walked with a prance like 756
a bantam cock. He had seen *//Gauwa* in the darkness, he told us. He had confronted him and driven him off with imprecations and sticks. I asked him to tell me what *//Gauwa* looked like. *//Gauwa* is as big as a mouse and has legs like a mouse, he promptly told me, showing me a pipe about four inches long to demonstrate *//Gauwa*'s size. (Demi did not say *//Gauwa* was a mouse; he said ' as big as '.) *//Gauwa* is covered all over with short yellow hairs. This bright, prancing little man had seen a little god. None of the other medicine men saw *//Gauwa* as small as that.

Gao Scarf sees *//Gauwa* regularly. He is like a man in form, but not such as we. He is about two and a half feet tall. (Gao demonstrated with a stick.) He has yellow hair over his whole body. He does not speak as we speak. He says, ' *hu hu hu* ', like the medicine men when they are performing a ceremony, but softly. Only medicine men hear him and understand him.

Another Gao said that *//Gauwa* is about a foot tall and the colour of a wart hog. He has the form of a man.

When Gao Medicine is in trance, he often sees *//Gauwa*. He is a being about the height of a guinea-fowl, grey in colour like the bark of the ubiquitous camelthorn tree. But to Gao, *//Gauwa* is not clearly visible; he is like a mist.

/Ti/kay claimed to me that he was ' young in medicine ' and had never seen *//Gauwa*, as he had claimed that he had never seen *≠Gao/na*. This was an engaging torsion of the truth. I myself had many times seen /Ti/kay appear to confront *//Gauwa* during his curing. /Ti/kay was to me the most spectacular of all the medicine men in performing the ceremony. He did not fear to scream into the shadows, ' *Nonabe!* You have brought a bad medicine. It is going to kill someone. Take it back.' The people, I am sure, did not believe that he was ' young in medicine ' and that he did not see *//Gauwa* when the other medicine men did. /Ti/kay, as I think is apparent even [115 ●
in these brief accounts of him, was something of a deviant. I believe that he contra- 156]
dicted other informants because his nature habitually drove him to oppose others and that, at the same time, he deliberately and rationally tried to deceive me and lead me astray, first for one reason, then another. He was jealous of our harmonious relations with *≠*Toma and Gao Medicine. We were pleased and grateful to them when they would work with us and he refused, and this made him spiteful. Also, due to some influence which we do not know about, he may actually believe some of the things he told us, such as that *//Gauwa* lives in the east instead of the west. We were never certain about him.

The *//Gauwasi*

The Nyae Nyae /Kung believe strongly and vividly in the existence of spirits of 775
the dead, the *//gauwasi*, who live immortal lives in the sky with *≠Gao/na*, doing his bidding. The *//gauwasi* come to earth and enter into the affairs of men when *≠Gao/na* so commands them. The /Kung fear them, pray to them to invoke their mercy or sympathy, exhort them in anger. The concept of having special relations with their [769]
own ancestors or of worshipping ancestors is lacking.

The people claim that they fear to speak of the *//gauwasi* lest they call attention to themselves or offend the spirits. They say it is a ' death thing to speak of them much ',

MARRIAGE AMONG /KUNG BUSHMEN

LORNA MARSHALL

101 BECAUSE within the area we indicate by shading on the map[1] the /Kung Bushmen intermarry among themselves, by custom and preference, members of the Harvard Peabody Smithsonian Kalahari Expeditions needed a convenient way of referring to that area as a unit and arbitrarily called it the region of Nyae Nyae.

Nyae Nyae is a corruption of the /Kung name //Nua/ei. The name Nyae Nyae refers
131 strictly to a group of pans in South West Africa (S.W.A.) centred approximately at Gautscha Pan at about 19°48′30″ S, 20°34′36″ E. We extend the application of the name to an area around the pans of about 10,000 square miles, lying for the most part

[102]

Map of portions of South West Africa, the Bechuanaland Protectorate and Angola. The shading marks the Nyae Nyae region.

in S.W.A. but reaching some miles over the border of the Bechuanaland Protectorate (B.P.). There are no strictly conceived boundaries around the area. We can only vaguely define it by saying that it does not include Karakuwise to the west or Chadum to the north. It does not, we think, reach eastward much farther than Kai Kai, or southward much beyond Blaubush Pan (40 or 50 miles south of Gam).

101 We establish the periphery of the region on the basis of statements made by
582 /Kung informants in the interior. They say that they intermarry among the bands
[131] which live within the area we describe and do not customarily marry with other

[1] The sketch-map here provided is based on the
[102] National Geographic *Map of Africa and the Arabian Peninsula*, March 1950, and the *Times Atlas of the World*, Vol. IV. The orientation of Gautscha is taken from the S.W.A. Surveyor-General's map dated at Windhoek 7:11:35.

1:Marshall E-5 (1952-1953) 1959 FX10 Bushmen FX10
Kung

101 Bushman language groups, Auen, Naron or /Kõ, to the south, or with other /Kung
582 whom the Nyae Nyae /Kung know to be living to the north-east and north-west of them.

619 The S.W.A. and B.P. governments administer the region as it lies within the
[648] territory of each but not as a unit in itself. The /Kung have developed no internal political organization to unite their bands. The unity of the region exists, in so far as we know, only in the minds of its /Kung population and in the fact of their intermarrying and being held together in a net of kinship and affinity.

648 About 1,000 /Kung live in the region. Roughly three-quarters of them live in 28
162 bands and are nomadic hunters and gatherers with no agriculture, herds, or beasts of
[621] burden. Approximately another fourth work for Chwana and Herero on their cattle posts on the periphery of the region. Most of these still have connexions with the interior bands and intermarry among them. In the interior there are no inhabitants
[177] other than /Kung, and no European or Bantu institutions modify the old /Kung way of life.

621 My study of /Kung marriage regulations is based on data derived during the
[114] years 1952–3 specifically from 14 bands with which we had the most contact and on which we gathered considerable genealogical material. These bands varied in size from 8 to 57 persons, averaging 25, with a total of 353. The marriage status of these persons as of 1952–3 is given in Fig. 1.

[162] FIG. 1. *The Marriage status of a sample of 353 persons*

601 /Kung social organization is of the 'Eskimo' type, as defined by Murdock.[1]
[595] Theirs is the sub-type, which varies from normal Eskimo in that polygyny occurs and
[596] extended families are common instead of independent nuclear families in neolocal
[611] residence. Other characteristics are normal Eskimo. Descent is reckoned bilaterally,
[614] There are no exogamous unilinear kin groups. There is bilateral extension of the
[835] incest taboo. Cousin terms[2] are the same for cross and parallel cousins and cousins are differentiated terminologically from siblings. One term is applied to both FaBr and MoBr, another to both FaSi and MoSi, and these terms differ from the terms for parents.

621 As we examine their rules of exogamy we find that the band is not an exogamous
582 unit as such. Actually most members of the band are so interrelated by consanguinity or affinity that the marriage regulations strictly prohibit their intermarrying,

[113] [1] G. P. Murdock, *Social Structure*, Macmillan Co., 1949, pp. 223, 226–8.

[2] For the terms and for special features of the system see Lorna Marshall: 'The Kin Terminology System of the /Kung Bushmen', *Africa*, vol. xxvii, No. 1, Jan. 1957.

1:Marshall E-5 (1952-1953) 1959 FX10 Bushmen FX10
Kung

but there might very likely be some between whom marriage would be permissible, such as, for instance, a man and his WiSi or his widowed BrWi. 621 582

The /Kung have no unit within which endogamy is absolutely required. Those of the Nyae Nyae region almost all marry among themselves within the region, not because a formulated social rule definitely prohibits their marrying outside but because they almost never go out. They do not like strange places, strange situations, or strange persons, and have no way of feeding themselves where they cannot depend on receiving food from relatives or friends and, in strange country, either do not know where the wild foods grow or might not be allowed to gather them if they found any. Nevertheless, a few Nyae Nyae /Kung have married other /Kung outside the region, and one /Kung woman we know is married outside her own race, with acceptance and ease of relations all around among her people and his, to a Chwana man at Gam, near the southern border of the region. We think in all probability there must be other mixed marriages along the Bechuanaland border which we do not know about, but we are safe in saying that among the Nyae Nyae /Kung such marriages are rare. [648]

Prolonged intermarriage within the region has woven these people together and much visiting among kin develops acquaintanceships and friendships which unite the whole Nyae Nyae /Kung population. They feel themselves to be an in-group and express this feeling in the words *ju |ŏassi*.[1] *Ju* means 'person' or 'persons'; 571 619 621

[1] S. Passarge puts the phrase on his map in *Die Buschmänner der Kalahari* (Berlin, 1907, Dietrich Reimer, p. 19), spelling it *Sw'gnassi*. He places it on the line of 20° S., slightly to the east of 20° E., near what we call the centre of the Nyae Nyae region, in the area designated on his and other maps as the Kaukau Veld. He places the phrase as if it were the name of a Bushman group, like Heikom, Naron, or some other, He places the name *'Kung* somewhat to the north-west. That is the name we spell */Kung*, which D. Bleek (*A Bushman Dictionary*, American Oriental Society, 1956, p. 447) records as */Kũ*, */Ku* or */Kuy* (person, Bushman).

Passarge places the name *'Kung* once more at about 23° S. as the name of another Bushman group. In sound the name is the same or very, very like the name of the more northerly group. Miss Bleek refers to this group as being popularly called 'Koon'. L. F. Maingard distinguishes between the two by spelling the name of the southerly group */Kõ*. The */Kõ* are to be found in B.P., in and south of Okwa. Whereas the /Kung language has four clicks (symbolized now as dental /, alveolar ≠, alveolar palatal /, lateral //), the */Kõ* language is very different and has a fifth click, that of the southern Bushman language groups, the labial ⊙. The phrase *ju |ŏassi* has nothing to do with the */Kõ*.

Maingard in 'Three Bushman Languages' (*African Studies*, 16/1, 1957, p. 37) uses the phrase as the name of a dialect of /Kung—'. . . *dyu/ŏã:si* (Northern Group, a dialect of /khũ, partly in South West Africa and partly in the Bechuanaland Protectorate)'. Bleek (op. cit., p. 354) does not record the phrase in /Kung (her northern Group II), but gives it in Auen (N I) and says it means 'Bushman'. She spells it *ju |nwasi*.

We think that the phrase *ju |ŏassi*, which we started spelling in this way because we did not know any better and continue because it is simpler, can be applied to groups of varying size and definition, on a variety of bases, when the in-group quality in comparison with the out-group is to be expressed in some way. When we asked what they call themselves, our /Kung informants often replied '*ju |ŏassi*' as though the phrase might be coextensive with Bushman as distinguished from non-Bushman (Europeans, */ku*, whom the /Kung also call 'red people', i.e. *ju gau*; or Bantu, whom the /Kung call *ju dao*, 'black people' or */goma* (or */komaʔ*), 'animals without hooves'). They also use *ju |ŏassi* when one might expect them to say '/Kung' as distinguished from other Bushman language groups, or when they distinguish themselves from other /Kung outside their region. They said that the Makaukau (Auen) Bushmen to the south were *ju dole* and they know that the Bushmen at Karakuwise, Nuregas, and Chadum speak /Kung but said they were *ju dole* nevertheless. I had the impression that it was the out-group quality in the phrase (strange and therefore potentially harmful) which was being expressed when they applied it as above and claimed that the Makaukau were a murderous people who have a medicine so deadly that you die if you but glance at it, and that those Nuregas /Kung put poison into the pipes they give you to smoke. One's friend or relative can also be *ju dole* if one is displeased with him. [101]

Isaak Utuhile (a Chwana chief under Queen Moremi, in Kubi, B.P.) said that in the phrase *ju |ŏassi*

1:Marshall E-5 (1952-1953) 1959 FX10 Bushmen FX10
Kung

571 we were unable to find a precise translation of */õassi* but think it connotes the *we* as
619 distinct from the *they* and has an overtone of something good and safe. The phrase is
621 an opposite of *ju dole*. *Dole* means strange or harmful or bad—evidently synonyms to the /Kung.

602 Because there were so many kinship ties among the people and because they have
621 a system (the name relationship—to be mentioned later) by which they apply kin
[608] terms to persons who are not consanguineous relatives or affines, I wondered for a time if we should find that the people who call themselves *ju /õassi* comprised a kin group of the type which Murdock calls a deme.[1] A deme is bilateral and endogamous, Murdock says, 'comparable to the sib both in size and in the traditional rather than demonstrable bonds of kinship which unite the members'. Though the Nyae Nyae region has the elements of a deme, I am convinced that it does not constitute, strictly speaking, an organized kin group of this type, of which the people are conscious as a social form. The endogamy of the region is customary and preferred, but not required by a social rule, and it is not from the group of people as a whole who are *ju /õassi* that social regulation derives.

Marriage regulations: the incest taboo and its expression in avoidances

582 Marriages are forbidden in /Kung social organization on one basis only. That
835 basis is incest. In common with nearly all mankind (excepting, of course, the Pharaohs and a few other rare examples), the /Kung incest taboo prohibits marriage or sexual relations between Fa and Da, Mo and So, Br and Si. The incest taboo is extended beyond the nuclear family to certain additional categories of persons, and marriage with them is also rigorously forbidden by /Kung social law.

[842] The /Kung did not express the belief that in-breeding *per se* produces inferior offspring and must for that reason be avoided. Although they believe that in conception the semen unites with menstrual blood, their language does not use the image of blood as ours does. They do not think of relatives as having the same blood or any
[827] physical substance in common, actually or by way of figure of speech to represent inheritable characteristics, in so far as we know, and do not think that common inheritance is somehow what makes it wrong to marry close kin.

The thought that incest has been avoided by mankind because it would be exceedingly disruptive to the internal cohesion of the nuclear family comes to the mind of the analyst of social forms but not to the minds of /Kung informants. And no mention was made of the obvious social advantage of marrying outside the nuclear family and thereby weaving a supporting web of kinship with many other families and bands.

The /Kung feel a deep, internalized, pervading horror of incest which they do not try to explain. Incest with parent, offspring, or sibling is unthinkable. 'Only dogs do that—not men.' 'It would be madness (*di*).' 'It would be dangerous, like going up to a lion.' Many refused to speak with me about such 'bad things'.

571 the Bushmen were saying of themselves, in effect,
619 'We are not animals, we are human beings', a con-
621 notation we did not discover in the thinking of the /Kung themselves. Ledimo, our chief interpreter, also a Chwana, said the phrase had the connotation of 'perfect persons' and that 'clean' and 'empty' were aspects of the word */õassi*, he thought. Elizabeth Marshall Thomas paraphrased it in the title of her book, *The Harmless People* (Knopf, New York; Martin Secker & Warburg, London, 1959).

[1] Murdock, op. cit., pp. 62–63.

1:Marshall E-5 (1952-1953) 1959 FX10 Bushmen FX10
Kung

The /Kung extend the incest taboo to certain categories of persons outside the nuclear family because they hold that the relationships resemble the relationships of the nuclear family and that it would therefore be incestuous to unite them in marriage. A man will say explicitly that he must not marry this or that woman because it would be 'like' marrying his mother, daughter, or sister. 582 835

The sexual constraints required between persons to whom the immediate or the extended incest taboo applies find expression in the marriage regulations and, in a secondary way, I believe, in certain avoidances which express constraint, namely: (1) Sexual joking and sexual insults, which are permitted between persons who have the joking relationship and must be avoided by others. (2) A sitting taboo. The same persons who must avoid sexual joking must also avoid sitting close to each other or to each other's family fires—with two exceptions, namely: (*a*) parents and offspring, who must never make sexual jokes but who do not at any age observe the sitting taboo; and (*b*) all young children, including siblings. The /Kung believe that the persons who must observe the sitting taboo should not allow their genital organs to touch the same spot. No great distance need separate these persons when they sit. About 18 inches is a minimum but is sufficient. The taboo is applied without sex differentiation: men must not sit near men or women, or women near women or men if they do not have the joking relationship. (3)With the exception of siblings of any age, the same persons who avoid joking avoid using each other's names in direct address. They use a kin term instead or the men may use a respect term for each other—*/nau*, 'old man'. (4) Brothers and sisters do not sit near each other when they reach adolescence and, after marriage, when they have dwelling-places of their own, do not enter each other's scherms (shelters). (5) Parents and SoWi and DaHu, in addition to observing the joking, sitting, and name avoidances, do not enter each other's scherms and do not speak to each other in the first few years of their affinal relationship. They are the only persons in /Kung society who must avoid speaking together. After three children have been born, this avoidance is eased somewhat. In-laws may then speak occasionally; once in two or three days would be considered permissible. This interesting avoidance, so varied in intensity and so widely spread in human societies, appears in /Kung society to afford whatever benefits it has without imposing great hardship at any time. A daughter-in-law may lean her scherm upon her husband's parents' scherm and build her fire only about four or five feet away, and what she wants to say to her parents-in-law she says aloud to her husband or child and her parents-in-law overhear and respond in like manner. A son-in-law also could communicate in this way. I think only a /Kung or an informed observer would know that the in-laws were not speaking directly to each other. 602 835 [593] [593] 606

The symbolism or expression of sexual constraint which underlies the joking and sitting avoidances is also observable in the modesty of these people. I believe that their modesty is not obedience to a specific taboo, like the sitting taboo, but is a more general response to being constantly in the presence of persons to whom the incest taboo applies, before whom any expression of sex would be improper. The general demeanour of the /Kung is modest. The dancing, if it gives any expression at all to sexuality or eroticism, conveys it with such restraint and delicacy as to be in extreme contrast to the dancing of the neighbouring Bantu tribes. Both men and women among the /Kung are exceedingly modest about exposing their genital 834 [831]

1:Marshall E-5 (1952-1953) 1959 FX10 Bushmen FX10
Kung

834 organs and, though the women's breasts are naked (breasts are associated with
[831] nursing, not sex), the women would not expose their buttocks, which are definitely associated with sex, as the position for sexual intercourse is for the man to be at the back of the woman. When they urinate or defecate, men, women, and all but young
[514] children who are not yet toilet trained go away from the werf and squat behind bushes or in the tall grass out of sight.

The persons who express in the avoidances the sexual constraint required by the
602 incest taboo are none the less free to engage in other activities of life together. Whether or not they must avoid joking and sitting near each other, whether or not
835 they may marry, they may talk (except with SoWi or DaHu), hunt, share meat, share the water-hole, gather plant foods, cook, eat, make journeys, visit, exchange gifts, and, if they wish, huddle their scherms and fires together. And, although they must not direct sexual jokes or insults to each other, they may laugh as heartily when they overhear the jokes as relatives do who have the joking relationship together.

Because it is interesting to compare the pattern of the joking relationship with the pattern of marriage regulation, I have indicated it when I list the various categories of persons with whom marriage is forbidden or allowed.

Extension of the incest taboo to four categories

Marriage regulations, patterned upon the incest taboo as it applies in the relation-
582 ships of the nuclear family, and extended to certain other relationships because they
835 are considered to be like those of the nuclear family, forbid ego's marriage with four categories of persons, as follows: (1) members of the nuclear family and certain other consanguineous relatives; (2) certain affines; (3) step-parents, stepchildren, stepbrothers, stepsisters, and the close kin of ego's father's wife other than his mother (for example, ego's mother's co-wife's sister, who is 'like' his MoSi; (4) certain name relatives.

Category 1: ego's consanguineous relatives with whom marriage is forbidden

582 In Fig. 2 are listed the consanguineous relatives whom a /Kung must not marry.
602 The terms applied to them are given in their basic form only, all complicating
835 factors being omitted as they have no bearing on marriage regulations. The term which ego applies to the male in a given category appears first; the term applied to females follows. The joking status is indicated by 'yes' if ego has the joking relationship with the given category of relatives, 'no' if he has not.

The /Kung use the expression 'We are one people' when they refer to certain consanguineous relatives—e.g. any lineal kin and the close collaterals listed in Fig. 2—but they do not consider siblings of grandparents, fourth cousins or still more remote collaterals as being of 'one people' with themselves. The /Kung, who are capable of being pushed to logical conclusions by an interrogator, say that they recognize a degree of consanguinity among such collaterals but spoke of them as
[553] 'those people'. 'Those people would name their children for their own people', they said, for example. 'We name our children for our people.'

I made considerable effort to determine whether or not I should include third
[605] cousins as within 'one people'. Many of the informants from whom we gathered genealogical data did not know the names of their third cousins, but, when we estab-

1:Marshall E-5 (1952-1953) 1959 FX10 Bushmen FX10
Kung

lished the definition, with sticks and diagrams in the sand and the names of some actual people, ≠Toma, the leader of the band we lived with, insisted that third cousins were ' one's own people '. We ' red people ' might marry our own third cousins, he said, but Bushmen would know that they were one people and should not marry.

FIG. 2. *Consanguineous relatives whom ego must not marry*

	Male	*Female*	*Joking*
Great-grandparents	*tsu*	*||ga*	no
Grandparents	*/gu!na*	*tŭn*	yes
Parents	*ba*	*dai*	no
Siblings of parents	*tsu*	*||ga*	no
Siblings	*/go*	*/kwi*	yes, same sex no, opp. sex
Cousins, 1st, 2nd, 3rd	*/gu!na*	*tŭn*	yes
Offspring	*/ha*	*≠ khai*	no
Nephews, nieces	*tsu*	*||ga*	no
Grandchildren	*/gu!na*	*tŭn*	yes
Great-grandchildren	*tsu*	*||ga*	no

The kin who are likened, by being of the same generation, to his parents, to his offspring, and to his siblings, are those to whom a /Kung feels the marriage regulations are particularly directed. Siblings of parents are ' like ' parents, cousins are ' like ' siblings, nephews and nieces are ' like ' offspring. Marriage with all these is rigorously forbidden.

Ego's marriage with great-grandparents, grandparents, grandchildren, and great-grandchildren is also forbidden but is not a concern. Age and consanguinity combine to push the very thought virtually out of mind. To the /Kung it seemed utterly ridiculous of me to inquire even about the collaterals in these generations. ' Those old people are already dead ', said someone. ' It will be for my grandson to mind the rules when the young children grow up ', said ≠Toma in effect. ' It is not my wish to marry a baby.'

Category 2: affines

The second category of persons to whom the incest taboo is extended is composed of certain affines. Their affinal relationship is considered to be indissoluble once it is established, and ego's marriage with them is prohibited, even though the person through whom the affinal relationship with ego is brought about be dead or divorced. The thought of incestuous relations with at least some of these affines (especially parents of spouse and spouses of offspring) is as horrifying to a /Kung as if they were members of his nuclear family. We learned of no instances of the taboo being broken among them.

The affines with whom marriage is forbidden, who correspond terminologically with ego's parents' generation, ego's own and that of his offspring, are listed in Fig. 3. Joking is allowed or not as it is with ego's kin in these generations.

Parents of ego's SoWi and DaHu are terminologically of ego's generation and he may joke with them but he must not marry them, for that would make his So and SoWi or Da and DaHu stepbrother and stepsister to each other, which would be most awkward.

1:Marshall E-5 (1952-1953) 1959 FX10 Bushmen FX10
Kung

582 Why marriage is prohibited with HuBrSo and WiSiDa was explained by ≠Toma.
602 Marriages with HuBr or WiSi are highly preferred marriages. This makes ≠Toma
835 'feel like' his WiSiHu, he said, even though he is not married to her, and, as a result, his WiSiDa seems to him like his own daughter.

FIG. 3. *Affines*

[601]

Marriage forbidden	*Male*	*Female*	*Joking*
Parents of ego's spouse	*≠tum*	*|utsu*	
Spouses of FaBr, FaSi, MoBr, MoSi	*tru*	*||ga*	no
SiHuFa w.s., BrWiMo m.s.	*tru*	*||ga*	
(Ego's generation terminologically)			
Parents of SoWi, DaHu	*/umba*	*/undai*	yes
Spouses of So and Da	*≠tum*	*|utsu*	no
HuBrSo, WiSiDa	*tru*	*||ga*	

Marriage with a BrWiMo or SiHuFa seems improper to the /Kung because a
[587] man's marriage with his BrWi is highly preferred, as is a woman's with a SiHu (should the death of the spouse or divorce make their marriage possible), and the parents of these affines therefore seem 'like' parents of the spouse.

In the sibling category among affines ego is prohibited from marrying only WiBrWi or HuSiHu. The reason for this prohibition appears to lie in the consistency of the joking pattern, about which three more points must be made. First, throughout

FIG. 4. *Marriage forbidden with WiBrWi, HuSiHu*

Male ego		*Female ego*	
	Joking		*Joking*
Br and BrWi	yes	Br and BrWi	no
Si and SiHu	no	Si and SiHu	yes
WiSi and WiSiHu	yes	HuBr and HuBrWi	yes
WiBr and WiBrWi	no	HuSi and HuSiHu	no

the whole system (except among remote name relatives), ego maintains the same joking status with *both* members of a married couple, for example, with FaBr and FaBrWi, WiSi and WiSiHu, &c. Secondly, in the differentiation of sex between siblings among ego's affines with respect to the joking relationship, the point of reference is the spouse. Ego has the joking relationship with his own spouse and with the sibling of his spouse who is the same sex as his spouse. He avoids joking with his spouse's sibling whose sex is opposite to his spouse. Thirdly, among affines in the sibling category the extended incest taboo and the avoidances coincide. Sex permitting, if ego may joke he may marry, and if he avoids joking he is prohibited from marrying. As we list ego's siblings and affines in Fig. 4 we see that WiBrWi and HuSiHu are the only ones whose sex is opposite to ego's, making marriage possible, but with whom ego is constrained from joking because he does not joke with his WiBr or HuSi, according the same joking status to both members of a married couple.

1:Marshall E-5 (1952-1953) 1959 FX10 Bushmen FX10
Kung

Categories 3 and 4: step-parents, &c; name relatives 582

The third category to which the incest taboo is extended, step-parents, &c., needs 835
no elucidation.

The fourth category, certain name relatives, should be further described. The 553
name relationship, described in the paper on kin terminology,[1] is connected with a 608
system of naming children. The /Kung have no surnames. A /Kung father invariably names his first-born son or daughter for his parent of the same sex; usually the second-born for the parent of the child's mother; subsequent children for his own sibling or the sibling of the child's mother or the spouses of those siblings. He never names a child for himself or for the child's mother. Because this pattern of naming exists, the /Kung feel that if two non-consanguineous persons have the same name, they are likely to have had consanguineous connexions in the forgotten past, and from this concept the /Kung have developed what we called their name relationship. In a system too complex to summarize here they apply kin terms to persons on the basis of their names.

The names have passed from family to family, through intermarriage in the region, and from generation to generation, to such an extent that every /Kung of [619] the region whom we interrogated on the subject had a kin term for every other /Kung, except for one man who had once met four /Kung from afar for whom he had no terms. This had made him uneasy.

The /Kung welcome the sense of belonging to an in-group which the name rela- 553
tionship affords them. They welcome also the fact that they know how to behave with 602
people with respect to the avoidances. They fear (*koa*) to make a mistake about joking 608
and sitting, they say, and feel secure in righteousness and propriety when they know what behaviour is correct and conform to it. The kin terms sort out the whole /Kung population of the region for them. They avoid joking with name relatives whose names classify them with kin or affines of the generation of parents, or with offspring or with a sibling of opposite sex or with great-grandparents. They may joke with name relatives whose names classify them with grandparents, a sibling of the same sex, or the spouse. (Cf. Figs. 2 and 3.)

The incest taboo is extended to name relatives. If ego is forbidden to marry them 553
because of the way their names classify them, he also does not joke with them. But, 582
as we shall see when we consider approved marriages, the system does not maintain 608
perfect consistency between joking and marriage among name relatives, and it does 835
not follow that if ego must not joke he therefore must not marry. The incest taboo is extended specifically to the following name relatives: (1) anyone who has the name of ego's parent or offspring; (2) the parent, offspring or sibling of opposite sex of anyone who has the same name as ego, (3) anyone who has the same name as ego's spouse's parent or his offspring's spouse. ≠Toma explained that it would 'sound as though' one had married his parent, child, or one of these close affines.

Deviations from the rules 183

The /Kung conform strictly to their marriage regulations in the first two cate- 582
gories, kindred and affines. None of the persons whose genealogical records we 835
605

[1] Marshall, op. cit., pp. 13–15, 22–23.

183 gathered (about 175) had married lineal kin or collaterals, at least through first cousins.
582 However, informants told about two /Kung men in B.P. who had married their
835 cousins; we could not find out which type of cousins. What was interesting was the
605 attitude of the informants. They said the men should not have done this, but there was no talk of madness or danger or expressions of horror such as we had observed when incest was spoken of at other times. No punishments, social or divine, had been meted out, according to the informants. Some said they thought it was not too bad a thing for a man to do, especially if the woman were a FaSiDa, who is not, they said, so much like your sister as a MoSiDa. I believe that the anomaly of the system's allowing joking with cousins, although it prohibits marriage, mitigates, in all probability, the force of the incest taboo and accounts to some extent for the tolerance towards the breakers of this rule.

How much deviation there is in marrying second and third cousins we do not
[124] know. We soon gave up trying to gather data on relatives more remote than first cousins because informants so often did not know the names and we could not rely on the information.

582 One account came to our ears of a man who had violated the incest taboo with his
627 stepdaughter. He was /Gunda Legs, the MoBr of old Gau of Band 1, and he lived with Band 9. He is dead now. What he did was so outside the good and the normal
684 that it could be accounted for only by madness. He had drunk the milk of a young
835 gemsbok doe, the people told us, and this is what had made him mad. Something
159 came from his forehead and went in and out, a sort of swelling. After that he fell in love with his stepdaughter, ≠Nisa, and married her, and both she and her mother
[753] were his wives at the same time. The people 'laughed at him' so much because he had made such a horrifying 'mistake' that he took his stepdaughter and lived apart from his band—the only instance we know of a man and woman living alone. They had a son, ≠Toma, who died young. When /Gunda's madness waned he sometimes came back to his people; he would go again when his madness returned. People said they did not understand why ≠Nisa went with him. They mocked at her, said that she was *dole*, 'bad', and that it was 'nonsense' to fall in love with one's stepfather. Our informants laughed uneasily when they told about it as they laugh when they
[154] tell of vultures eating their meat or of being chased by fierce bees when they try to take a honeycomb. There came to my mind a penetrating remark made by //Kushay, the wife of /Qui in Band 1, which might, I thought, be applied to ≠Nisa. //Kushay had said, 'When a Bushman girl goes against the customs of her people and people talk about her and say she is bad, she is very unhappy. She would hear the people talking and be ashamed and would come to them angry—angry because she is ashamed', or, I thought, go away because she is ashamed.

Deviations occur in the fourth category. Two men we met had married women
183 with the same names as their mothers. A man named /Ti/kay married the daughter of
553 another /Ti/kay, and there were other such instances. /Qui, the husband of the above
582 //Kushay in Band 1, said he proposed to do this himself. The girl's family had flatly
608 refused, but he was going to keep on trying. ≠Toma said he would not do this but
835 he sees some people doing these things. There are not enough women whom a man may properly marry, he said, and he would be in favour of changing the marriage prohibitions among name relatives so that a man need avoid only ugly women.

1:Marshall E-5 (1952-1953) 1959 FX10 Bushmen FX10
Kung

Approved marriages

No marriages are compulsory in /Kung society. 582

Marriage is allowed with anyone to whom the incest taboo is not extended—with 602
three degrees of approval: preference, permission, and toleration. Once a marriage has taken place, no differentiation in status is made.

The joking relationship is the differentiating factor between the preference and mere permission which the society accords. In preferred marriages the man and woman are name relatives who have had the joking relationship before marriage and have applied to each other the terms */gu/na* and *tŭn*. This makes the marriage seem altogether right.

Marriage is permitted between name relatives who apply the terms *tsu* and *||ga* to each other and avoided joking before marriage, provided the incest taboo is not specifically extended to them; and, in the same way, marriage is permitted between name relatives who apply to each other the terms */go*, brother, and */kwi*, sister.

Marriage is tolerated, though rarely experienced, as I mentioned before, with persons to whom the name relationship and the application of kin terms is not extended; i.e. persons of other races, persons of other Bushman language groups, or other /Kung outside the region.

To contract a marriage with someone with whom one must not joke brings in a 182
touch of the anomalous which deprives the /Kung of the perfect symmetry and con- 183
sistency which so content them and make them feel secure in rightness. This society 582
tolerates the anomaly, for obviously it must not forbid marriage in too many cate- 593
gories, and adjusts the joking status by giving to man and wife the joking relationship 602
as soon as marriage takes place.

Though neither the sororate nor the levirate is compulsory, marriage is highly 587
approved with the wife of a deceased brother or the husband of a sister. A man is 768
expected to take care of his BrWi should she need his care, even though he is not required to marry her. Marriage with a WiSi or HuBr is also highly approved. Ego has had the joking relationship with these affines.

A marriage arrangement which the /Kung consider especially good is called */oa ku*. 583
This means that an exchange is made between two bands: a boy and girl from one 619
marry a girl and boy from the other. */Oa ku* is not a common practice. Bands as units
have no authority in the arrangements of marriages, which is the duty of the parents, [584]
as we shall describe presently, and parents do not make the exchange between bands a major factor in their choices. If it happens to come about, however, the people are glad because each band thereby gains a person to replace the person lost and the bonds between the bands are strengthened.

Polygynous marriages

Polygyny is the ideal form of marriage among the /Kung. This is not a society in 595
which prestige and wealth concentrate to give certain categories of men more power 554
or right than others to acquire wives. Headmen and medicine men are held in esteem, 556
but their positions do not in themselves entitle them to have extra wives or give
them special dispensations. Wealth tends to be fairly well equalized. Everyone carries [422]
his or her own artifacts, the men on carrying-sticks over their shoulders, the women [482]

1:Marshall E-5 (1952-1953) 1959 FX10 Bushmen FX10
Kung

[482] 559 556 595 [422] [431] in the pouches of their karosses along with their babies. This puts a strict limit upon any desire to possess great quantities of property in movables. Furthermore, gift-giving keeps all personal property moving in a current through the region and no one possesses very much more than another. The determining factors in obtaining more than one wife are apt to be the personalities of the individuals and the man's ability to hunt. 'Women love meat', we were told, and like their husbands to be good hunters.

595 The number of wives a man may have is not regulated by social rules but by his ability to obtain and support them. This limits him usually to one. None of the nine polygynists in the band had more than two. However, we heard of a man named Gao, now dead, who had had four wives all at one time. He had been a fabulous hunter and maker of arrows and was the father of the /Ti/kay who is the husband of two sisters, /Naoka and /Nai, in Band 9.

Only two of the nine pairs of co-wives had traceable consanguineous relationship. The above /Ti/kay's wives were sisters—the only ones—and, in Band 10, Old ≠Gao's younger wife, /Ghia, was the BrDa of his older wife, Bau.

[601] */Kui*, sister, is the term which co-wives apply to each other, unless they have the same name, in which case they term each other */gu/na*. The /Kung, though they do not institutionalize the sororate, say it is a good idea to marry sisters because they are not so likely to be jealous of each other as other women. /Ti/kay's wives, who appeared to live in harmony and affection and to support each other, provided an example of the validity of this opinion.

Marriage to the same man gives co-wives the joking relationship, and they do not observe the sitting or the name avoidance, though they may have avoided each other before marriage.

[342] /Kung co-wives share one scherm and one family fire. The scherm, the little shelter of branches and grass which the women build, a half hemisphere in shape, is only 3 to 4 ft. wide on the open side, about 3 ft. deep at the centre, perhaps 4 to 5 ft. high at the peak. In it and in front of it, beside their one fire, the two wives live, share their man, share the food they gather, share the work of fetching water and wood, nurse each other's babies, and co-operate in whatever degree of harmony their spirits can attain.

513 Husbands and wives may sleep separately or lie close together, side by side, or feet to feet. The woman holds her infant in her arms. Young children sleep near by bundled together, two or three in one kaross. Girls at about seven or eight go to sleep with a grandmother or a widowed friend or relative. The boys of the band, beginning at the same age, all sleep at a boys' fire.

[595] [821] /Ti/kay (Band 9), husband of the two attractive sisters, sees to it that his wives lie close to him, especially on cold nights, one on each side. Sleeping thus they were like the three stars of Orion which we call the Belt, but which the /Kung say are three zebras, two females with a male between them.

513 833 It is under such conditions that the /Kung usually have sexual intercourse—at night, in their sleeping place. They cover themselves with their karosses and are very discreet. The position is to lie on the side, the man at the back of the woman. Men pull the labia of the women before intercourse. The wives of /Ti/kay told me that they took pleasure in intercourse. I asked them if they had orgasms. We had

1:Marshall E-5 (1952-1953) 1959 FX10 Bushmen FX10
Kung

considerable difficulty with the interpretation, but I believe they finally understood 513
what I was trying to say. They did, they said, and added that one sleeps very well 833
afterwards.

Co-wives attain varying degrees of harmony. The expression of jealousy, especially 595
loud wrangling, upsets everybody, as all expression of discord does. Women are 578
trained by group approval to mould their conduct to acceptance. But often painful 626
jealousy does beset them, and the tensions are there, though to some extent hidden.

/Aha, wife of a young /Ti/kay in Band 13 at Gam, and still a young woman herself, 159
had with her fierce jealousy driven /Khoa, the pretty young second wife, wailing 595
into the night, back to her family's scherm. /Ti/kay used to sit for hours upon hours
singing soft, sad, sweet laments for /Khoa, but she did not return to live with
him.

The behaviour of /Naoka and Di/ai, the wives of the medicine man, Gao, in Band 1, was more typical. Both women were approaching middle age, Di/ai somewhat younger than /Naoka. /Naoka had two married daughters and a teen-age son when Gao married Di/ai. The two women obviously disliked each other, but managed to preserve a decent semblance of harmony by self-control, silence, avoiding each other as much as possible in the small space they live in by their fire, and by separating often—going with different groups of relatives and friends to gather wild plant foods, to fetch water, or to visit.

A few men said that the jealousy of co-wives could be so unbearable that they 595
would not marry a second wife, but one said it made him feel good to have two
women fighting over him. Most of the men said they wanted more than one wife.
They pitied Laurence Marshall because the laws of his land forbade his having [186]
several, which they considered him rich enough to afford. One said he would not
live where there were such nonsensical rules.

The first wife is considered to have a somewhat more highly esteemed and dominant position. She is supposed to have the right to tell a second wife what to do, and a young second wife should fetch water and wood for the older wife, but I never saw this done.

No property or other material advantage is given a first wife and no important social advantages accrue. For instance, headmanship is inherited by the headman's [672]
eldest son by whichever wife he may be borne, and being the mother of a headman
does not place a woman above other mothers of sons.

It appeared to me that first wives were often at a disadvantage. Among the people we knew, the husbands favoured their younger, second wives with two exceptions: /Ti/kay of Band 9 favoured his first wife, the elder sister, and Gao, the headman of Band 2, favoured his first wife. Both were good-tempered, intelligent, able women. They appeared to take care of the young girls who were their co-wives, rather than to be served in any way by them. Other older first wives seemed sometimes to be dejected. One told me her husband always took the young second wife with him and, to her deep humiliation, sometimes left her, the first wife, to stay for a time with one or another family in the band, although she said to him, 'Why do you shame me so?'

None of the /Kung women informants expressed enthusiasm for polygyny. Each 185
wanted a husband to herself. They did not expound the social advantage which 595

1:Marshall E-5 (1952-1953) 1959 FX10 Bushmen FX10
Kung

185 polygyny affords women—that none remain long without the support of a husband.
595 They just said they did not want to be second wives, nor did they want their husbands to take second wives, and protests and quarrels attended a husband's proposal to do so.

Marriage by capture

583 Marriage by capture was spoken of fairly frequently by the /Kung in conversation. Elizabeth Marshall Thomas and I questioned a number of informants about it and we are convinced that wives are not actually acquired by this means at present. Perhaps they were in the past. The /Kung are a present-oriented people who make
[181] no concerted or consistent effort to retain their history and teach it to their children, and we obtained no significant data on their past customs. Nowadays the idea of capturing wives appears to be enjoyed by the men as a fantasy. The remarks of one /Gaishay illustrate what I mean. He weighs, at a good guess, about ninety pounds and looks like a miniature Mephistopheles. With a gleam he told me that if he wanted to take another wife he would go to her werf, seize her, throw her over his shoulder and run off with her. That is the way Bushmen do, he said, and he wished I could see him do so. I also wished that I could.

Arrangements for marriage

584 First marriages are arranged by the parents of the bride and groom, and second marriages also if the couple are still young. Adults, when both have been married before, may contract subsequent marriages themselves.

Although there is a slight paternal emphasis in this society which recognizes
[611] bilateral descent, and the father names all his children, his authority is not clearly
[593] dominant over the mother's in the choice of a mate for their child. By and large, it appears that the father and mother talk things over and come to agreement. If they do not agree, it appears that the strength of personality of one or the other, the opinions of relatives, and various circumstances have weight in the decision.

Either the parents of the boy or those of the girl may take the initiative and go to the other parents with the proposal. A go-between is not required, though it is possible that a friend will sometimes act as such. The parents visit and talk, and, if they all agree, the arrangement is thereby settled upon. They normally give each other gifts in honour of the occasion.

Property does not enter much into the consideration of the parents in arranging marriages for their children. No property settlement is made, no bride-price paid, no dower given, though at the time of the wedding a few gifts are exchanged.

Food and water must, one imagines, weigh in the parents' thinking when a marriage is being arranged, and may sometimes be a determining factor. However, there is a considerable amount of equalization in these supplies. Veldkos[1] and water-holes
423 are not owned by individuals but by headmen for their bands, in a way I shall describe in a paper on bands. In the Nyae Nyae region each band has access to a supply, else the people would be dead or somewhere else, and things balance out in

[1] *Veldkos* (field food) is an Afrikaans word used to refer to any kind of wild plant material which people gather to eat. Edible fruits, seeds, roots, tubers, leaves, all are included.

various ways. The affine who marries into the band, as long as he lives with the band, has a right to the water, to the hunting, and to the gathering of the wild foods, as members born to the band have. 423

I think that primarily the values and assets that parents seek in choosing mates for their children have to do with the kind of security which is attained through human responses and relations. Friends may want their children to marry because they know and trust each other. Or a family may want to increase its kinship bonds—and thereby its security—with certain bands for any number of reasons—among them could be food, water, or a desire to have supporting friends in a certain area—and, like the crowned heads of Europe, the /Kung may deliberately seek to establish alliances through marriages. 581 185

Merging with such desires and to be balanced with them are the characteristics of the families concerned. The /Kung want their boys and girls to marry into upstanding families, among people who are ' able to feed themselves ', who are ' not lazy and not thin '. They do not want ' far-hearted ' in-laws who are not generous in food-sharing and gift-giving. /U, ≠Toma's wife, said she would take particular note of their generosity in giving bead ornaments to their children. She would not want a daughter of hers to marry among people who were stingy in that. Proper observance of the avoidances and other social regulations is an asset in in-laws, for they can then be assumed to have taught their children how to behave properly. 185 577 581

The individual's characteristics are also a concern. Parents of boys hope the girls to whom their sons are engaged will grow up to be good-looking, because, they say, a man takes pride in a beautiful wife. Xama, the mother of Gao, the headman of Band 2, said she had wanted for her son a light-skinned girl with good teeth who was not too thin and not too tall. But most important of all is a sweet temper, she said. A mother hopes, she said, that the girl will not be lazy or wander about visiting at night at other people's fires ' like a bitch '. The girl should observe the avoidances and the menstruation and other taboos, and in every way behave as a well brought up girl should. However, since the girls are engaged when they are very young, I suppose the parents of the boys can only watch them grow and hope. 185 581 826

Girls would not want a man ' as tall as a giraffe ', we were told. They would seek a smaller husband. /U's first husband, from whom she was divorced, is so tall (almost six feet) that people laugh and say, ' Did his mother have a dream with a *//gaua* (a spirit)? '

The girls themselves, all twitters and giggles, told me what they admire in the boys. They like a good hunter like /Gunda; and they like handsome teeth and a wide smile like young Tsamgao's; and straight, slender legs like //Ao's; and a fluid, swift walk like /Gao's; and they hate a big black belly like Gao's—the middle-aged medicine man in a band distant from Gautscha, to whom the young /Doin was married.

The parents of a girl want the boy to be responsible, kind to their daughter and, above all, a good provider—which means a good hunter. They want him to make his arrows straight, to shoot swiftly and accurately, to be able to run down an eland, and, most of all, they want a son-in-law whose heart says to him, ' Why am I sitting lazily here in the werf? Why do I not get up and go hunting? ' and who, in obedience to his heart, and the group's desire, and the magic which has been rubbed into his scarifications in the Ceremony of the First Killing, gets up and goes. [304] [881]

1:Marshall E-5 (1952-1953) 1959 FX10 Bushmen FX10
Kung

584 Boys are always considerably older than girls before their parents betroth them.
[805] We never knew the precise age of a /Kung because they reckon time from one season to the next, not in years, and do not keep track of a person's age by any measurement. Boys appear to be usually around twelve to fourteen or fifteen before they are
[868] betrothed. At this age their fathers begin to take them on the long hard hunts for the
[883] big animals which supply the people's meat and begin their serious hunting training.

As to girls, wives are in such demand in this polygynous society that the parents of boys have their eyes upon every girl baby and may say to the parents of an unborn infant, 'If it is a girl, let us have her for our son.' It seems to be more usual, however, to betroth the girls when they are about two to five or six. The boys wait patiently for long years for their fiancées to grow up.

We wondered what would happen if, when the time at last came for the marriage, the boy or girl should refuse the parents' choice. It appears that they seldom do. A boy is usually too eager to get a wife. To refuse the betrothed might mean he would have to wait for years and years again for a girl baby to grow up. The girls are usually too young to protest but it sometimes happens that one does. /Kung
593 parents are exceedingly protective and permissive with their children, and delight
855 in them, especially in their infancy. I have sometimes seen an older child scolded or
861 snapped at by an impatient mother but I never saw a child severely punished. No hard work and few, if any, regular chores are demanded of dependent children. The same protectiveness and permissiveness were apparent in parents' lenience with respect to their girls' betrothals. They complied with the girls' wishes.

The marriage may take place when the parents agree. The age of the young people
582 varies greatly. For the girl, there are no definite age or other requirements. The girl need not, for instance, show physical signs of maturity. When the important Ceremony of First Menstruation is performed, the girl may have been married for years. Bau, who was married to Tsamgao in 1951, did not have her first child for six years. /Nai was married to /Gunda in May 1953. She menstruated for the first time in March 1959. To be married as young as that is not at all unusual, but we have known several girls to be somewhat older.

The parents explain that when the girls marry young they 'get used to' their
582 husbands. I am sure there is a great deal in this and I am sure it strongly affects the
593 relations of husbands and wives, but I had insufficient opportunity to observe eight- or nine-year-old brides with teen-age husbands, and insufficient means, through interpreters, to grasp the nature of their relationship. What is the young husband like to a girl child? The friendly, gentle old man, Demi, said to me, 'They enjoy their youth together.'

593 The young couples are expected not to have sexual intercourse till the girls are 'big
834 enough', informants said, and the boys must not force the girls. If a girl complained to her parents and the parents took her back and sent the young husband away, he might have to wait for years again for another bride to grow up. The /Kung are
[123] prevented by their incest taboos and their modesty from speaking freely about sex and I learned nothing about the actual sexual practices of the young couples. /Nai and her young husband, /Gunda, had only one good kaross between them; they slept
513 together bundled in it, feet to feet. Bau and Tsamgao slept quite apart—at different
593 fires—when we observed them in 1952. In 1953 they slept at their own fire, apart, she

1:Marshall E-5 (1952-1953) 1959 FX10 Bushmen FX10
Kung

inside the scherm, he outside. Apparently no social rules pattern their sleeping. 513 593
Individual adjustments are made.

The boys must before they marry have proved themselves to be hunters and must have had performed over them the most important ceremony in the life of a /Kung boy—the Ceremony of the First Killing. The killing of birds or small animals does not qualify him for the ceremony; the animal he kills must be one of the great antelopes or a giraffe or buffalo, any one of the large animals killed for meat. When the boy himself has killed one of these, he is ceremonially scarified by his father or by another kinsman if his father is dead. The ceremony is performed twice for each boy. For the first male animal he is scarified on his right side and for the first female on his left side. Charred meat and fat, turned to magic by the ceremony, are rubbed into the several lines of vertical cuts on his face, arms, back, and chest to give him the will to hunt, good sight, and accurate aim; also to enable him to find the animal and to protect him from being seen by the animal. The ceremony is both a solemn celebration and a magic force to increase and strengthen the boy's power to hunt. It also carries with it the right to marriage and attests the boy's readiness. 582 224 884 [304]

Marriage does not necessarily follow immediately upon this ceremony; years may elapse, but the way is prepared and readiness is proved. And once more the act of hunting is ceremonially linked with marriage. At the time of the wedding, the boy must bring to his bride's parents an animal that he himself has killed. The animal he brings must not be eaten by the bride. 585 224

A boy who never killed any large meat animal would not be given a wife, informants said. This was why the strange old deviant, /Gaishay, had remained a bachelor. For reasons no one understood he could not hunt; he gathered veldkos like a woman. Gossip had it that twice he had tried to drag a woman against her will into his scherm but had not succeeded. Informants remarked, 'Women like meat.' They do, but there is far more to it than that. 582 589 [462]

As John Marshall shows in his film, *The Hunters*, the primary sources of physical life, sex and food, are involved. In /Kung concept they are linked together, and, as they pertain to men, their duality is lifted to oneness in the being of the man, who is the sexually powerful male and the provider, the hunter. Power as a man and a male and worthiness and dignity are associated with hunting and not with the failure to hunt. 562 828 224

Since they are related, both the sexual and the hunting powers of the young man can be captured at once with a bride. For the first several years of marriage the boy goes to live with his bride's parents, or her people, should her parents be dead, to hunt for them. The parents of girls speak constantly of wanting their sons-in-law to provide them with food as though it were an obsession. 'We are old', they say, or 'We shall soon be old [whether this is actually true or not]; we need a young man to hunt for us'; 'our daughter's husband must get us something to eat'; 'we need karosses'; 'we want meat'—these are their refrains. 583 [591] [606]

Another value the /Kung place upon the boy's hunting during his bride-service appears in their belief that if the husband hunts for his wife and feeds her while she is still a growing child she becomes the more his. Food seems to be a main concern in bride-service, but the people also say that they want to be sure that the boy measures up in every way and will take good care of their daughter, and that the girl will have time to get used to her husband. [581] [593]

1:Marshall E-5 (1952-1953) 1959 FX10 Bushmen FX10
Kung

588 One of the most rigid social rules the /Kung have, besides the incest taboo within the nuclear family and its extension, is the giving of bride-service. We heard of no [591] deviation from it. A boy or man of any age, a headman or headman's son, an important medicine man, all go to live with their brides' parents or other relatives in first marriages and subsequent marriages, whatever the age of the bride.

The duration of bride-service is indefinite. Informants told us a man must stay with his wife's people until three children have been born. If he goes when the girl is eight or nine, she may not have her first child for possibly seven or eight or more years. It is safe to say that ten years of bride-service are not unusual. It is long enough for the boy's youth to have turned to manhood and for him to be looked upon as an able, responsible head of his family. After his bride-service is fulfilled a man may [591] remain with his wife's band or may return with his wife and children to his own.

The Wedding of /Nai and /Gunda

159 /Nai was a pretty little girl, we think about eight years old, or so, with a quick responsive smile, when she was married on 22 May 1953, at Gautscha. The bride- [582] groom, /Gunda, was about sixteen, we judged, and the people said he was the best young hunter among the boys of the territory.

/Nai belonged to Band 1, /Gunda to Band 2. Both of these bands belong to the [621] water-hole at Gautscha and were encamped there at the time, about 100 feet apart. We lived with Band 1.

/Nai's mother, Di/ai, had divorced her former husband, Gumtsa, the father of /Nai, and was now the second wife of the medicine man, Gao, in Band 1. /Gunda's mother, Khuan//a, had divorced /Gunda's father, Bo. Khuan//a was now the second wife of Gau in Band 2. Both Gumtsa and Bo were living far from Gautscha.

159 The two mothers had betrothed their children some time previously. We heard 584 that Di/ai had had her eye on the strong young /Gunda, saying, 'We must get this boy for /Nai so he will take care of her and we can get enough to eat, also karosses', [581] and had gone to Khuan//a to propose the betrothal. Khuan//a had said, 'Yes, this is very good.' The mothers exchanged gifts. Khuan//a gave to Di/ai a necklace of five strings of ostrich egg shell beads which reached to the umbilicus (shorter strings would have been inappropriate) and Di/ai gave other beads and copper wire ornaments to Khuan//a.

Gumtsa, /Nai's father, heard about the betrothal. He had hoped to arrange a marriage between /Nai and someone of his choice at Kubi where he lived. One day in November 1952 he came to Gautscha to complain, he said, that he had not been consulted and to protest against the betrothal and take /Nai to Kubi with him. Tension [578] rose. /Nai cried and looked very frightened. The members of both Bands 1 and 2, though they had no theoretical authority in the matter, all expressed themselves [628] poured torrents of talk over the affair, mostly supporting Di/ai in her stoutest refusal to yield /Nai, saying that Gumtsa had not fed /Nai, had not so much as given her a gift, and should not now come and interfere in her betrothal. After four days of this Gumtsa gave up and went home.

159 Meanwhile the affair, like a spoon stirring in a pot, brought to light another ten- 584 sion. Some of /Nai's relatives began to express disapproval of her betrothal, not 578 because they wanted her to go with the father but because they were angry with

1:Marshall E-5 (1952-1953) 1959 FX10 Bushmen FX10
Kung

Khuan//a, the mother of the bridegroom. They claimed that Khuan//a was stingy— and worse. /Nai's stepfather, Gao, had given a present of beads to one of his relatives. A knife which was gradually making its way to him as a return gift had been diverted by Khuan//a to one of her relatives. Khuan//a, some claimed, was 'like that!' /Nai's MoSi, /U, the wife of ≠Toma, said in a voice that could be heard across the werf that Khuan//a had 'borrowed' a coal from her fire one day without asking. At this, Khuan//a had with quiet dignity risen from her fire place and walked off to the waterhole. /U also said, but in a low voice, that Khuan//a, while she was still married to Bo, had been sleeping in the bushes with Gau till the people said to Gau 'What are you doing with Khuan//a?' She then left Bo and married Gau, although they were distant relatives, in some way we never could trace, who should not marry. Gau loved Khuan//a so much, /U sniffed, that he spoiled her and let her have power over his belongings. /U had no doubt but that Gau would soon find himself very poor. /U disapproved of /Nai's marriage to the son of such a woman but said that she would reconsider her position if the knife which had been diverted by Khuan//a were now given to Gao, as had been expected. 159 578 584

It never was, but gifts of ostrich egg shell beads and a blanket were given and Gao declared himself satisfied. /Nai's mother wanted the marriage so much she was ready to overlook the matter of the knife and they all started again in peace.

Nothing more happened about /Nai's wedding until the morning of 21 May 1953, when we noticed the two mothers together building the wedding scherm. They had placed it between the two werfs about twenty-five feet from the fire of the bride's family. The scherm was slightly larger and more nearly round and much more carefully built than the usual skimpy structures. 159 585

Next morning /Nai's mother asked me if I would bring the wood for the bride's fire. I knew it was because her back ached, not to honour me, but I felt honoured anyway and brought the wood. [123]

All that day /Nai sat at a short distance from her family's fire, the fire that each family keeps burning in front of the scherm for cooking and for light and warmth at night. The fire-light is more of a house to the Bushmen than the scherm is. /Nai was covered, head and all, with a big gemsbok kaross of her mother's. She wore her usual beads, but no special regalia brightened the sombre grey-brown of the old kaross. [354]

Just as the sun was setting, without speaking to her mother and stepfather, /Nai walked alone over to another fire, seven or eight yards away, the big kaross still pulled over her head and trailing behind her. She went to this fire because it was the fire beside which she had recently been sleeping with her mother's widowed cousin, since she had reached the age when girls and boys leave off sleeping beside their parents. Her old great-uncle was there. She sat down opposite him. He paid no particular attention to her and they did not speak. [591]

By then the sun had sunk below the horizon. /Nai uncovered her head but kept the kaross tied around her waist and over one shoulder in the way karosses are customarily worn.

Presently two girls came to /Nai. They had waited till twilight was deepening into darkness because people sleep at night and a wedding is a 'night-thing'. One was ≠Nisa, /Nai's stepfather's daughter by his first wife. The other was Xama from

1:Marshall E-5 (1952-1953) 1959 FX10 Bushmen FX10 -
Kung

159 Band 2. She was /Nai's second cousin (MoFaBrSoDa) and the first cousin once
585 removed of the groom (MoSiDaDa). The attendants were not selected for their precise relationship to the bride. They were the only young kinswomen present in the two bands. The girls sat down and chatted with /Nai for a moment and then stood up and, giggling and chattering, took /Nai by the arms. /Nai drew back. Then Xama pulled /Nai's arms over her shoulders, bent and took /Nai on to her back so that her feet did not touch the ground. Xama carried /Nai in this position to the wedding scherm, laid her down inside, to the left of the opening as one entered, in the dark shadow, and covered her over with the kaross. There /Nai remained. We did not see her again that night.

It is the custom for the parents to take brands from their own fires to light the wedding fire of the bride and groom. Presumably this was done, though I did not see it. When the girls arrived the fire was burning and a young man, a cousin of the groom, was tending it. The two girls sat down by the fire on the women's side.

562 /Kung men and women must sit on opposite sides of the fire.[1] They believe that if
834 male and female genital organs should touch the same spot on the ground the man's
352 hunting powers would be vitiated and the woman would get a sickness in her genito-urinary tract, not an ordinary, human, communicable disease but a magical one. The woman's side is to the left as one faces the entrance to the scherm, the men's to the right. The fire is always in front of the entrance if the scherm is built, but, more often than not, if the weather is good, or the people are travelling and staying
[342] only one night, or the wife is lazy, she hangs the family belongings in a bush and does not build a scherm. Then it is the custom to thrust two upright sticks into the ground to represent the entrance, so that the family may orient itself.

In the werf of Band 2, about twenty or thirty yards to the west, a group of boys had
159 come to /Gunda to attend him. They were all the young boys of the werf who
585 were approximately his age, two cousins (MoSiSo) and four of the sons of /Gunda's stepfather by his first wife. The boys made a show of catching /Gunda and held him by the arms for a moment, laughing and talking. Then they formed a line with /Gunda following at the end, walked to the wedding fire, and sat down on the men's

[1] This taboo reveals the association which, I
224 believe, the /Kung make between the hunting power
833 of men and the male sexual principle. Both must be protected, and sexual activity must be controlled and constrained lest the life-giving and food-producing force of men be weakened or drained away. During the period of a hunt a man must not have sexual intercourse—that is, while the man is looking for game and, after he has shot his little poisoned arrow into the animal, while he is tracking it for miles and waiting and watching for days till it dies of the poison. A hunt usually demands many days and nights of effort and privation.

[783] Too frequent indulgence in sexual intercourse with one's wife, even when no hunt is in progress, is
[841] believed to diminish a man's hunting power. Some men believed that once in five nights was best; others thought once in three nights was all right. Men who have the joking relationship constantly play upon the theme of excess, taunting each other: 'You do not know hunting, you know women', 'You cannot leave your wife long enough to hunt.'

The /Kung are less strict about another taboo. A woman is supposed not to touch a man's hunting gear at any time, because this would lessen his power to hunt. But I have often seen women touch assegais and quivers. Indeed it has sometimes been urgently necessary to do so when the children got hold of them, as, for instance, when the three-year-old ≠Gao, agile as a flea, took after us with his father's assegai, infuriated with us for some sudden notion of his own. There is a medicine called *gow gowna*, made from a plant, which may be rubbed on the weapons to purify them if they are touched by women, but I never saw this done and doubted if anyone bothered with it. The effect of a woman's touching the hunting gear is much stronger if she is menstruating. I assume they are more careful then.

1:Marshall E-5 (1952-1953) 1959 FX10 Bushmen FX10
Kung

side. /Gunda sat behind the line of boys, in a deep shadow, to show that he was 159
' ashamed ' and respected (feared, *koa*) the wedding scherm. 585

One of the boys began to play, not their ceremonial music or special wedding music, but songs of the *//guashi*, as they call them, the little wordless melodies these [533] people compose about happenings in their lives, about pleasures or distress, about their moods. They play and sing these melodies for hours upon hours in the afternoons when they are resting or in the evenings by their fires, and they played for hours that night at the wedding fire.

Soon young guests began to arrive, the children of both werfs with whom /Nai played, all of them younger than the boys who attended /Gunda and the girls who carried /Nai. The youngest guest was the ubiquitous three-year-old boy who never missed anything. No adults came.

One boy brought four mangetti nuts with him and roasted, cracked, and ate them himself. That was all that appeared by way of a feast. Di/ai said that they would like to have given the children something to eat but there was nothing in the werf that night. Even though the others had had something to eat, the bride and groom would have had to abstain. They must not talk or eat, to show they are ' ashamed '. The young guests seemed to enjoy themselves, nevertheless, and were still singing and chatting when I left at midnight.

Soon after sunrise the following morning—/Gunda had already departed—/Nai's mother went to the wedding scherm and sat down beside the embers of the night's fire. /Nai stood shivering beside her in her little genital apron and the duiker skin [291] which women wear around their buttocks and up between their legs, but stripped of her kaross. The mother had brought a little fat (eland fat, if they had it, would be [825] used) and a bit of powdered red stone, one of the red earths (*|gam !gai gwoie*), mixed with fat. She rubbed /Nai all over with the fat, and drew a line on her forehead and [302] a circular design on her cheeks with the red powder mixed with fat. Over in werf 2, Gao, Nai's stepfather, presented /Gunda with a blanket.

This completed the wedding ceremony.

/Nai was a lively child who loved the dancing and singing games the girls play. 159
She often danced alone, tapping her bare feet on a stone in rapid rhythm or making a 462
game of printing a design in the sand with tiny steps. She liked babies and as often as not had her infant half-brother or some very small cousin tied to her back. That morning she appeared to turn into a housewife as though it were her next blithe step. When the women went to gather veldkos, she put on her own little duiker skin [222] kaross, took her digging-stick and went with them. At the end of the day, when they returned in the slanting sunset light, she had two big roots. She went straight to her own fire, blew on the embers, added wood, and sat down. Three ostrich egg shells [415] full of water and her digging-stick were her household goods. These she arranged beside the scherm. /Gunda came and sat down opposite her. She smiled at him and set the roots in the ashes to cook.

It has been said in talks with informants that the bridegroom must bring an 159
antelope which he himself has killed to the parents of the bride before the wedding, 183
but no animal had been brought; there had not been a scrap of meat in the werf for 585
days. I asked Di/ai about this. ' Oh, that,' she said in effect. ' Yes, he should give me an antelope, but we thought we would have the wedding first and that /Gunda would

1:Marshall E-5 (1952-1953) 1959 FX10 Bushmen FX10
Kung

585 [159] [183] then come with us when we leave tomorrow to gather *tsi*. He will hunt from that place and get us some meat.'

The ritual elements in the wedding ceremony, in so far as we observed, were as follows: (1) carrying the bride so that her feet do not touch the ground; (2) covering her head so that the sun does not shine upon it; (3) waiting till the sun has set before taking her to the wedding scherm; (4) the fact that the scherm is specially built and set apart from the others; (5) anointing with fat; (6) painting a design on the forehead and cheeks with powdered red stone; (7) lighting the wedding fire with brands from the fires of the bride's and groom's parents.

585 881 [174] Apart from the third and seventh, all these elements occur also in the Ceremony of the First Menstruation, a more elaborate and prolonged ceremony from which the /Kung wedding ceremony undoubtedly derives. The design on the face is the same; the girl's feet must not touch the ground from the instant her first menstruation begins to the end of the period, when she is washed and anointed with both eland or other fat and the oil of the *tsi* (*Bauhinia esculenta* Burch).[1] When the girl is taken to her special scherm or moved out of it to urinate or defecate she is carried on the back of a kinswoman. A kaross over her head shields her from the sun whether she is sitting in the scherm or being carried out.

Our endeavour to bring to light the meaning of the ritual elements yielded little. The meaning or origin of the design on the face, I was convinced, was not withheld but lost to memory, lore or myth. 'It is our custom' was all the people could tell me.

[171] About the ritual of the feet not touching the ground, the custom frequently observed by divine kings and menstruating girls, the /Kung had no more illumination. They think that the carrying is the overcoming of the girl's symbolized modesty about going to the arms of her bridegroom, which she should properly feign even if she is eager to go, and her reluctance to separate from her own family: I think that when the attendants take hold of the bride and groom by the arm and pull them a little they symbolize the overcoming of reluctance and modesty and perhaps there is even a vestige of bride capture in that gesture, but of the feet not touching the ground the meaning is lost. Obviously, however, in this society the bride is equated to the menstruating girl. In the past the girl's wedding and her first menstruation may have [174] been celebrated at one time.

The /Kung say that the sun is death-giving. When the three months of life-giving rains are past, the sun dries up the water pools. It kills the fresh leaves and 585 821 fruits, dries the roots and berries, and would scorch the people if they did not find shade and dig shallow pits and lie in them covered lightly with sand which they have moistened with their urine for coolness. They pity the morning star, the *kuli |gaishay*, which crosses the sky all day ahead of the sun, has no branches to carry for shade and cannot turn aside to rest under a tree. The sun is a 'death thing' and the bride 593 585 is shielded from it.

602 The most important element of behaviour with respect to kinship in the wedding

Kung

ceremony is the avoidance of the parents, which is symbolic of the incest taboo. Any (preferably young) kinswoman who is tall enough and strong enough, whether she herself is married or not, and whether or not she has the joking relation with the bride, may carry the bride; and any may attend her. Only the mother absolutely must not do so. Likewise the groom's father must not attend him. Neither pair of parents go to sit by the wedding fire, for they must not sit near their son's wife or daughter's husband, nor speak to them. Guests of mature years might go and sit by the wedding fire only if they have the joking relationship with both the bride and the groom. Very young guests, such as we saw at /Nai's and /Gunda's fire, may go, whether they joke or not with the bride and groom, because the avoidances are not stringently observed with young children.

585 593 602

Termination of marriage and remarriage

Widows and widowers are not avoided in any special way because of their widowhood. 589 768

If her husband dies, a young widow usually returns to her own parents or lives with one of her own siblings, but, if her people are dead, or if it is her preference, she may stay on with her deceased husband's people. It is the duty of her HuBr to hunt for her if she needs his support. [736 607]

Several possibilities are open to a young widower: rarely he might stay with his deceased wife's parents or siblings; more likely he would return to his own parents or siblings; and, when he marries again, he goes into matrilocal residence with the new bride. In any case, a man is responsible for his wife's parents and young siblings, and, if they depended on him for support, he would take them with him. They would be likely to prefer, however, to live with an adult son, daughter, or sibling of their own if they had any. [587 736]

Old widowers or widows whose own parents are dead usually live with either a son or daughter, or perhaps with their own sibling—as they wish.

The surviving spouse is free to marry again within the regulations of the extended incest taboo, which applies to all marriages. 587 885

Parents would arrange the subsequent marriage of a widowed boy or girl. Adults may make their own arrangements directly. My impression was that persons might be considered fully adult somewhere in their middle or late twenties.

An adult man takes the initiative and asks the woman to marry him. Robert Dyson in the 1951 expedition learned that one way for a man to ask a woman to marry him is to present her with a bow and arrow. If she accepts it she indicates her willingness to consider his suit.

No restriction of time is put upon the remarriage of a widower, but a widow should not remarry until one rainy season has passed. She is then considered 'clean' and may marry again. ≠Toma said, 'The rain washes (*||num*) the death away from the widow.' *||Num* is the gesture of wiping a dish with one finger and then licking the finger. /Ti/kay of Band 9 said that some men wait for a rainy season to pass, but that others would be pleased the husband was dead and, without waiting, say, 'This is my chance.' One interpreter understood that the widow had to take off her kaross and spend a night out, letting the rain fall on her, but ≠Toma said this was not what 587 589

1:Marshall E-5 (1952-1953) 1959 FX10 Bushmen FX10
Kung

587 was meant. That would be very uncomfortable, he said. It would make her shiver and
589 might make her sick. The rainy season's passing is what cleanses the woman. When
[783] she is about to go to her new husband she prepares herself by washing in the ordinary way.

Unless a woman is quite old she does not remain long unmarried. One man said, 'Even if a widow is thick and tall, but is a good woman, some man will want her.' Widows may marry as second wives of married men, or they may marry widowers, divorced men, or bachelors. The two young widows and the two divorced women who were unmarried in 1953, had remarried by 1955. Only the very old widows remain unmarried.

There are so few unmarried women that widowers have difficulty in finding wives. The young widowed musician, /Gao, was an example. After his first wife's death he had married the daughter of Gao, the medicine man in Band 1, when she was approximately ten or eleven years old, about the age of his own son, and was patiently waiting for her to grow up. Only one of the old widowers had succeeded in finding a wife by 1957.

736 The children of a widowed parent are kept by that parent. A widower may leave
768 his children with a woman relative, but they remain his. Orphaned children go to live with relatives. There is a tendency to feel that the boys belong eventually to the
[611] father's side of the family, the girls to the mother's. This concept came to our attention several times, but we did not find it to be a rigid social rule. The relative who
[604] is expected to take the children if they are young is the MoSi. But the FaSi might be nearer or more able for one reason or another to take them and might do so. FaBr would be the relative most likely to take half-grown boys, but again MoBr might be the one. Failing these, some other relative would take them. When it came to arrang-
[584] ing marriages for orphaned children, informants said that the father's elder brother would have the most authority; a stepfather or stepmother has none.

[597] Adoption does not exist in /Kung society.

Divorce may terminate a marriage. The couple may divorce without formality,
586 by mutual consent or by one spouse simply leaving the other. The /Kung word for ending a marriage in this way is *!kao joo*. I use the word 'divorce' for convenience, although no legal action takes place. No religious dispensation is involved, no permission or action on the part of the headman or group is required. If parents of a very young couple withheld consent this might influence the couple, but the parents' consent is not a requirement. No property entanglements present difficulties, for there is no dowry or bride-price to be resolved. The only property a /Kung owns
[422] personally consists of movables, and these are never owned in common by man and wife. Every artifact down to a single bead belongs to an individual, who takes his property with him in case of divorce.

Divorce does not change people's status in the community in any way. They are free to remarry without restrictions.

Divorce is never obligatory and the grounds are not formalized; the desire of the couple concerned is the determining factor. A condition such as sterility, for example, or a wrongdoing such as adultery, might or might not lead to divorce, depending on how the couple felt about it. Mistreatment or failure to provide would certainly be considered justification for divorce, should they ever occur, but justifica-

1:Marshall E-5 (1952-1953) 1959 FX10 Bushmen FX10
Kung

tion is not necessary. 'A wife can get tired of loving her husband', we were told, 586
'and just tell him to go away.'

We learned about seven divorces only in our sample. The middle-aged Khuan//a, the mother of the bridegroom, /Gunda, had left her first husband to marry her lover. Another middle-aged woman left her husband because he was on the point of marrying a second wife. Jealousy between the two young wives at Gam, lamented in song by the young husband, had been the cause of the third. The whims of young girls caused others. A girl named /Ungka, married to a considerably older man, hated him though he was good to her and gave her oil and ornaments for her hair. She cut off her hair and threw it, ornaments and all, into the fire. She thrust her head into the ashes and made herself filthy. In another instance, the girl took offence the first night of her marriage and left her young husband next day, to his painful chagrin. The [587]
lenient and patient parents of these girls arranged other marriages. Di/ai, the mother of the bride /Nai, and now the wife of Gao, the medicine man in Band 1, was divorced from two former husbands in her youth. And /U, her sister, while still very young had been persuaded by ≠Toma to leave her tall young husband from Gam and to marry him.

Our data on frequency of divorce are too scant to be significant. We have merely the impression that there seems to be some tendency for couples to separate while they are young and in whatever adolescent turbulence the /Kung experience, but that, on the other hand, there is considerable stability in marriage once a compatible mate is found. At least, no divorces occurred between 1952 and 1959 in eight of the bands of our sample. We lack data on the others.

Young children of divorced parents remain with the mother. As they grow to adolescence the girls usually stay with their mothers, the boys may go to their fathers or stay with their mothers or spend some time with each.

Although the /Kung do not consider divorce reprehensible, they deplore it. Divorce is untoward, disruptive; it can cause trouble. Anything other than peace and [181]
harmony in human relations makes the /Kung uneasy.

Extra-marital sexual relations

Murdock points out that 'Our own culture includes a blanket taboo against 171
fornication, an over-all prohibition of all sexual intercourse outside of the marital relationship.'[1] He goes on to say that our society is highly aberrant in this and that 'from available evidence [however] it seems unlikely that a general prohibition of sex relations outside of marriage occurs in as many as five per cent of the peoples of the earth'.[2]

/Kung society has an over-all prohibition against any sexual relations outside of 837
marriage with one exception. It makes no requirements such as sexual hospitality or *jus primae noctis*. It makes no provision for sexual access to certain categories of kin or affines outside of marriage, such as BrWi. Premarital unchastity, unchastity of [836]
widows, and prostitution are not among their social conventions. But */kamheri*, though not required, is either fully permitted or tolerated as not a very bad thing; I never reached certainty as to which of these attitudes the society adopted.

/Kamheri means that two men may agree to exchange wives temporarily, provided

[1] Murdock, op. cit., p. 263. [2] Ibid., p. 264.

1:Marshall E-5 (1952-1953) 1959 FX10 Bushmen FX10
Kung

837 the wives consent. This is regarded as a concern of the couples involved rather than a concern of society as a whole. One man said, 'If you want to sleep with someone's wife, you get him to sleep with yours, then neither of you goes after the other with poisoned arrows.'

[572] The word */kamheri* was used by //Ao, one of the young hunters, to express his deep feeling of friendship for John Marshall. 'We are such friends that we are */kamheri*', he said, but, as John had no wife to exchange, this remark had its funny side which delighted the men.

No actual instance of */kamheri* came to our attention and we failed in finding out if it is now practised. One man in Gam lent his first wife to a unmarried friend, one of the gossips told us, because he was in love with his second and did not care any longer for the first, but this was a mere deviation from the rules, not an instance of */kamheri*.

We heard of several irregular sexual unions in addition to the above. Rape did not appear in stories or gossip. Fornication must be very rare because there is practically no one to fornicate with. Almost all females are married except very young girls and leathery old grandmothers. Adultery is the usual form for irregular unions to take. Adultery, however, is sharply limited by several deterrents. One deterrent is 684 the incest taboo, of course, which forbids extra-marital sexual relations as rigorously 837 as it does marriage with persons to whom the taboo is extended. The same internalized sanctions induce obedience to this rule as to the marriage regulations. The same gradation of feeling probably exists, and we expect that people comply strictly within the kindred and among close affines and are no doubt less strict with name relatives.

Ease of divorce must exert a modifying influence on adulterous unions. If a [586] married couple really want to change mates, nothing need deter them but the general difficulty of extricating themselves from the web of responsibilities which marriage entails.

In a sense, the impossibility of maintaining secrecy exerts a control over extra-151 marital relations. There is no privacy in a /Kung werf and the vast veld is not a cover. 153 The very life of these people depends on their being trained from childhood to look sharply at things and to take into their attention what they see, for they must 182 observe the most minute marks on vegetation to distinguish from the matted grasses the almost hair-thin brown vine stems that come up from the edible roots. Hunters memorize visual impressions and are able to follow the tracks of an individual animal in the midst of a large herd in a way that seems to us miraculous. It may be a week after a hunt that they return to recover an arrow that missed, miles from the werf, remembering where it lay in the vast monotonous sameness of grass and bush. They register every person's footprints in their minds, more vividly I am sure than we do faces, and read in the sand who walked where and how long ago.

185 The /Kung value control of anger, upholding self-control as an ideal, giving it group and individual approval and training for it. Despite this, volatile tempers 578 sometimes flare and burst out of all control. And always at hand are the little poisoned [411] arrows. They are formidable weapons. There is no antidote for the poison; at least our /Kung informants said they know none and told us of tragic deaths from the poison which would have been averted had they had an antidote.

684 Adultery, so exceedingly provocative of anger and vengeance, could be very

1:Marshall E-5 (1952-1953) 1959 FX10 Bushmen FX10
Kung

dangerous under these conditions. Anger turns upon the adulterer. We were never told about a woman being killed or even very severely punished, but a husband is considered to be quite within his rights by /Kung rules of conduct if he kills a man who sleeps with his wife. However, the adulterer may fight back. With poisoned arrows both men might be killed. Fighting is so dangerous it is feared by the /Kung with a pervading dread. 684

Nevertheless, although prudence counsels against it and anxiety attends it, adultery does occur. During the years from 1951 to 1958, five instances in our sample came to our knowledge. When it did occur, the most clearly observable behaviour was the attempt on the part of related persons and other members of the band to help resolve the situation in order to avoid fighting and discord, for fighting, like fire, may spread and consume much before it is quenched. [627] [578]

A husband and a young widower had quarrelled and almost fought over the attentions of the young widower to the wife. The fight had been averted by the husband running away. He came to Gautscha where we were with Band 1. When I saw him handling his weapons, his face contorted with emotion, visions possessed me of the two men, both angry and afraid, shooting each other in nervous self-defence, writhing, bleeding, and dying in agony, and I was as filled with the fear of fighting as any Bushman. But before sundown that day the affair was resolved in the following fashion. A relative of the young widower undertook to use his influence and went and brought the young widower and the wife to Gautscha. The relative had two motives. He wanted peace, as everybody does, and he wanted no disgrace in his family which the affair would bring, for the young widower and the wife were sexually taboo, albeit in the mildest and most extended way. He was an able man and he succeeded. The pair agreed to his behests. When they arrived at Gautscha the wife went directly to her husband and, to our suprise, in a few minutes they left the werf with their child and came over to our camp, where they settled themselves right in our cleared camp space. Presently the young widower came too, with his three children, and settled himself beside the others. Under our wings they had less fear of each other's flares of temper and tensions relaxed. In a day or so the young widower left. Peace prevailed. The wife was still with her husband in 1958. The young widower was taken by the B.P. authorities, we heard, for killing a man in another quarrel over a woman. 159 684 627 578

When John Marshall was with Band 1 in 1957–8, ≠Gao Lame, the unmarried young headman, took to sleeping with /Ghia, the second wife of Old ≠Gao, headman of Band 10. Nobody seemed to expect a great deal of /Ghia, who was thought not to have very good sense, and she was not blamed nearly so much as ≠Gao Lame. His family railed at him quite openly. 'People get killed doing that', said /U, his sister (≠Toma's wife). ≠Gao Lame eventually stopped sleeping with /Ghia. John thought the group's expressed opinion really did influence him. Furthermore, ≠Gao decided it would be best to go to Old ≠Gao and say he was sorry. Old ≠Gao said ≠Gao Lame was right to come directly to him and that they should not fight. He gave /Ghia a mild thrashing instead. Then /Ti/kay of Band 9, who was /Ghia's MoBr, roused up the whole affair by claiming that when ≠Gao Lame 'insulted' /Ghia he also insulted him—/Ti/kay. /Ti/kay, the husband of the two charming sisters, an intense and vital man, especially gifted in performing the curing ceremonies

1:Marshall E-5 (1952-1953) 1959 FX10 Bushmen FX10
Kung

159 as a medicine man, although in a cool moment he could speak eloquently and philo-
627 sophically about the evils of fighting, was an erratic person, self-centred, frightfully
684 jealous, shrewd to see that no one got more than he, quick to take offence. Gao, the
578 medicine man in Band 1, husband of ≠Gao Lame's older sister, Di/ai, shouted out that /Ti/kay was a trouble-maker not to leave well enough alone. /Ti/kay thereupon foully insulted Gao Medicine, who shouted back that /Ti/kay was not fit to be a headman. /Ti/kay, now in a rage, called out that Gao lied to his own arrows. John said that some of the people flattened down on the ground or got behind things at this point. But two of /Ti/kay's half-sisters, who were present, threw themselves on him, pulled him away, and sat down beside him, holding his arms. He quieted down and Gao Medicine also sat down and was quiet. As the tempers cooled, peace took hold once more and, John says, the affair did not flare up again, at least during the remaining weeks he was there.

In some societies it would be incumbent upon kin such as MoBr or SiHu to feign anger and make a show of fighting to satisfy the conventions of honour. We observed no episodes which raised this question other than the above. John was strongly of the opinion that the emotions were genuine and that /Ti/kay's temper, which we had all experienced two or three times before, had released itself once more, but that once more a fight had been averted because people wanted peace and harmony most of all.

Illegitimacy

There were no illegitimate children in our sample in the years 1952–3 and we
848 discovered no social norms established with respect to illegitimacy. Girls are usually
851 married before they are old enough to have children. But, we asked, what would happen if a girl had a baby before she was married? People said the parents would go to the father of the child and say he must marry their daughter. Did they know anyone who had done this? No.

Suppose that a child were conceived in adultery and it were known with certainty that the father was not the woman's husband, what would happen to that child? we asked. The baby would be kept by its mother, of course. After they had talked things over among themselves, one informant said, and others agreed, that they thought, if the woman's husband fed the child for years while it grew, he would be justified in keeping the child and the biological father should not try to take the child away.

159 There is such a child now in Band 9. In 1955 or 1956 white farmers came
848 into the Nyae Nyae region and illegally recruited some /Kung families. These families tried to run away from the farms some time later. They told us that they were followed by two white men and a white woman on horseback with guns, led by a 'tame' Bushman tracker. These people forced the /Kung to return to the farm by threats and pointed guns. In the fracas some of the /Kung got away. Husbands and wives were separated. When the S.W.A. authorities learned on which farm these /Kung families were, they acted promptly to restore them to their bands, and fined the farmer, but two years had passed. One girl had had a child by one of the /Kung men. Once they were all restored to Nyae Nyae, the girl went back to her own husband with her baby boy, and was with him in 1958. The people said the baby's bio-

1:Marshall E-5 (1952-1953) 1959 FX10 Bushmen FX10
Kung

logical father, as well as his mother's husband, should do something nice for him. 159
Perhaps when he receives his first assegai his begetter will give it, for that is a very 848
proud thing—but we do not know what the future holds for these people or where they will be by then.

The dominance of men

Wives are much desired by the young men, who usually wait for years for their 562
infant fiancées to grow up, and by men who want second wives, and by widowers. [581]
/Kung women are not only precious as mates, they are the food-gatherers and supply [222]
more of the daily food than the men do. Hunting[1] is very arduous in the Kalahari and [462]
the hunters succeed in bringing a big meat animal to the werf only about once or [224]
twice a month. Meanwhile women have dug roots and gathered berries and the other wild plant foods to feed their families every day. /Kung women in their two roles make a very great contribution.

In /Kung society, however, the magnitude of their contribution does not make women dominant. There are factors which bring the men forward clearly into dominance and leadership.

The primary factor is undoubtedly strength. /Kung men are small and slender, [142]
but they are wiry and vigorous. With their strength they carry and protect the very 147
life of their people. When they swing their weapons and implements and their small children on to their shoulders and stride out in front of the women, the image seems to reveal, as vividly as if a great artist had painted it, how the laden following women are borne up by the strength of their men and take heart from them.

Another factor which brings men clearly forward is the character of hunting and 462
its reward. Women bring the daily food, but there is only drudgery in digging and 562
picking in the hot sun and trudging back in the early evening to the werf with heavy [222]
roots and berries and babies all sagging in the pouches of their karosses, a small dead tree or two on one shoulder for the night fire, possibly another child astride the other shoulder. Many of the vegetable foods, furthermore, are rather tasteless and harsh [262]
and are not very satisfying. There is nothing splendid about returning with vegetables and wood. The return of the hunters is vastly different. The intense craving [262]
for meat, the anxiety that goes with the hunt, the deep excitement of the kill, finally [224]
the eating and the satisfaction reach to the very core of the people, engaging powerful emotions. Once, when an eland had been killed and the hunters were sighted [152]
with the meat on their backs, moving in a dark, lumpy, bobbing line in the golden grass, we heard the sound of voices in the werf rising in volume and pitch like the hum of excited bees. Some people ran toward the hunters, others crowded together at the edge of the werf, some danced up and down, the children squealed and ran about, the boys grappled and tussled together. The motion and sound had the effect of a vibration. Another time a young man who was said to be the best hunter in the region (/Qui Hunter we called him, his people called him Short /Qui), had been 462
charged by a magnificent cock ostrich on a big open pan where there was no refuge. 562
He knelt facing the creature till it was within close range and shot an arrow straight 224

[1] John Marshall has described /Kung hunting in his film, *The Hunters*, Peabody Museum Film Study Center, Harvard University, and in 'Man as Hunter', *Natural History*, the magazine of the American Museum of Natural History, New York, vol. lxvii, No. 6, June, and No. 7, August, 1958. [113]

1:Marshall E-5 (1952-1953) 1959 FX10 Bushmen FX10
Kung

562 into its heart. Back in the werf, while the meat was being cut up and distributed by
[462] /Qui's wife's brothers, he slept exhausted on the mound of black and white plumes
[224] and the women, some of the plumes in their hair, danced a dance of praise around him. This is the role of /Kung men and the way it should be.

By comparison with the men, the women are considerably more circumscribed in
157 knowledge, less ready for new experience, more suspicious and apprehensive of
562 strangers. They draw back and seem on the whole somewhat timid. The men protect them in many ways. They would not let the women ride with us in the truck, for instance, unless some of the men were with them.

The women expect the dependent role. They have their say in conversation but do not take part in the serious conclaves of the men, saying often, ' The men know these things. We do not know. The men must decide. ' And one woman said, 'A man can do everything—shoot and make fire. ' /Kung women are encouraged to be compliant by the fact that, in their love of peace, the /Kung like quiet, modest, gentle women. Overbearing, strident, demanding, or nagging women would disturb not only their own husbands but the whole werf. Disapproval of anyone's behaviour
[626] is expressed by the group in talk, and also by songs, such as the song of *The Two Baus*, which was composed about two loudly quarrelsome co-wives. When the two Baus heard this song strummed on the *||guashi* or hummed here and there in the shadows of the werf at night, they mended their ways.

Though the /Kung like gentleness and compliance in women, their society does
562 not impose extreme forms of obedience or subservience upon them and women are not ill treated. One man told Laurence Marshall that if he wanted to go somewhere and his wife wanted to go somewhere else he might have to talk, talk, talk, talk, talk, talk to persuade her.

We once saw a woman strike her husband on the head with her digging-stick in
562 a fit of frustration because he had coerced her to go with him when she wanted to
593 remain visiting her parents. He had coerced her swiftly and decisively by snatching her baby from her arms and walking ahead with it. In a flash the wife ran a few steps and hit him, then she went around in a circle, stamping her feet in great, high stamps like an enraged samurai in a Japanese print, then she followed her husband. I personally never saw a /Kung man hit a woman. This is not to say no /Kung ever did, but it is far from common.

The dominance of the /Kung men is more protective and life-giving than crushing to the women. On the whole a good balance seems to be attained and there is a notable freedom from quarrelling between husbands and wives. The instances of strife that we have mentioned are exceptional breaks in the usual peace of their well-adjusted human relations.

Conclusion	59

122 The following work was carried out by order of the Command of the Northern District of the Protectorate Forces as the result of a suggestion from the Museum for Ethnology in Berlin.

After I had spent the months of August, September, and 114 October of 1908 making the necessary observations, I was called away from Rietfontein (North) and thus out of the region of the ≠Auin [Auen]. This interruption of my studies, which had scarcely begun,

/135 cont./

114 accounts for the incompleteness and gaps in my data, defects which make themselves felt particularly in the last chapter. Thus, I could neither do the important section on linguistics nor make a collection of ethnological materials.

The observations and researches that I did undertake were repeatedly tested for their correctness to the best of my abilities. The possibility of error, of course, is nevertheless admitted without reservation.

Aminuis, August, 1908. Kaufmann.

General Observations

144 It is my conviction that the ǂAuin, as well as all other Kalahari Bushmen, do not represent a homogeneous race, but rather a people or, better still, several peoples who have lost their original character through mixture with one another and above all with peoples of other races (Bantu). At any rate, a number of Bergdamara [Bergdama] or Herero decidedly gives a stronger impression of derivation from the same mold than do the same number of Bushmen.

197 The linguistic differentiation of the individual tribes is sometimes so great that mutual intelligibility is impossible.

171 182 The apparent cultural homogeneity is probably based on the uniformity of the landscape that everywhere surrounds them and on the living conditions (Kalahari culture).

144 171 There is no doubt that an intimate relationship of some kind exists between the Hottentot and Bushmen. It may be that the Bushmen are degenerate Hottentot with some admixture of foreign blood, or, on the other hand, that the Hottentot are Bushmen with foreign admixture who have emancipated themselves from the Kalahari culture.

[114] 144 197 I believe I shall not be guilty of an indiscretion if I report that the ethnographer Dr. Pöch shares this view with me. In a private communication he writes to me from Kamelpan

/135 cont./

144 (Ngamiland): "I should like to observe briefly that the Kalahari
197 Bushmen are low in my estimation, both in respect to their language and to their appearance; I was able to confirm an extremely close relationship with the Nama [Hottentot], but in an old dialect no longer spoken today."

Since I lack the knowledge for making anthropological
141 measurements, I shall confine myself to /136/ presenting several ≠Auin types as I observed them. They may not be without value for comparative purposes.

I should like to add that in measuring physical height I obtained the following results:

Adult men (between 20 and 40 years of age)

Average	1.51 1/2	meters
Maximum height	1.62	meters
Minimum height	1.47	meters

Adult women (between 20 and 40 years of age)

Average	1.45 1/2	meters
Maximum height	1.53	meters
Minimum height	1.38	meters

A. Geography and Statistics

The ≠Auin, as they call themselves and as they are known to
131 the neighboring Bushmen tribes, inhabit that part of the central Kalahari which is more or less immediately bounded by the watering places Rietfontein, Ganab, Gam, Sidonitzaub, Otjiamangombe, Tjumda, Epukiro, Oas, Stampriet, Rooigrauwater, and Habakobis. Their territory lies for the greater part within the boundaries of the German protectorate. The adjoining sketch indicates as accurately as possible the geographic location, as well as the approximate territory of the neighboring Bushmen tribes. The
101 Hottentot designate the ≠Auin as ≠Au-San (Schinz), the inhabitants of the Chanse Veld as ≠Aukwé (Passarge), the Betschuana [Tswana] as Makaukau. The approximate number of Auin (1),

[104]

1. For the sake of simplicity I shall from now on omit the initial mark ++, which indicates the click.

/136 cont./ The approximate number of Auin,
162 naturally in the form of the very roughest estimate, is apparent from the following compilation:

There reside in the region of

Oas	about 300	persons
Dawis	" 150	"
Stampriet	" 250	"
Rooigrauwater	" 50	"
Korikas	" 150	"
Olifantskloof	" 200	"
Habakobis	" 100	"
Rietfontein	" 200	"
Tjumda	" 100	"
Go	" 150	"
Sidonitzaub	" 1,000	"
Karasburg	" 100	"
Epukiro	" 100	"
Ganab	" 100	"
Gam	" 100	"
Total	about 3,000	persons

[114] In my opinion the number of Bushmen living in the Kalahari (not only the Auin) has been consistently underestimated.

I wrote these lines in October, 1908. Today, in other words,
165 not yet a year later, I am forced to change my opinion, since
161 the malaria of the last rainy season has taken many victims and has decimated the Auin as well as the other tribes. According to the figures provided, I consider myself justified in suggesting that of the Auin estimated above at 3,000, only about half at most remain.

It is impossible to obtain more precise statistics since the
648 Bushmen successfully evade any kind of control. Even the administration of the protectorate takes account of this fact by dispensing from the outset with any registration or the like by the Kalahari Bushmen.

No special racial layers are to be distinguished among the
144 Auin, although it is doubtless true that certain individuals can be shown to have more Negro blood than others.

/136 cont./

142 The tribe at Gam in particular consists almost exclusively of comparatively large people who, even after a thorough washing, display a decidedly darker coloration than the other Auin.

162 According to my observations, there is something like one to two women for each man, and from two to three children for each woman.

162 847 [862] In this connection I would like to mention that newborn children are always killed if the mother is still nursing a child, which continues until about the third year of life. The killing is done immediately after birth by the mother, who buries the newborn child alive. The father has nothing to do with it. Since marital [853] intercourse continues during the nursing period and since this period lasts for about three years, it follows that approximately every third child is reared while those born in the meantime are killed without exception. This might well be a principal factor in the unquestionable decline in the population.

592 595 Since each woman has her special windscreen (hut), the man lives alternately with one and then another of his wives; the latter in turn have their children living with them, and it therefore follows that about three to four persons occupy each hut.

221 361 The size of the settlements (villages) is quite indefinite and changes according to the circumstances. During the dry season a settlement is formed usually by one to two families, whereas during the period of ample veld food, in other words, toward the end and shortly after /137/ [map appears here] /138/ the rainy season, sometimes up to 30 families join together to form a "village." In April, 1908, about 400 men were living in a settlement near Sidonitzaub. If their dependents are included, one will arrive at a figure of at least 1,000 persons.

[701] All the men are armed warriors.

161 As has already been noted, one can clearly observe a decrease in the population, which, judging by its rapid progress, can be designated as swiftly approaching extinction. Aside from infanti- [136] cide and malaria, the decrease of wild game may also be given as a reason for the population decline, since this decrease makes food more difficult to obtain. Older Auin state that in former times attacks by lions caused heavy losses.

Map of the Auin Region

/138 cont./

177 Since contact with the Whites was established, wars have
721 apparently declined considerably, but even today they exact a decidedly heavy toll.

22 The Auin is at the lowest stage of human development; he is exclusively a collector and hunter.

This way of life is dictated to him by the nature of his en-
133 vironment. This part of the Kalahari, where the watering places
137 are sometimes 100 kilometers apart and very limited in number,
182 does not permit livestock raising, especially also since the tschama [sometimes spelled tsama, a kind of melon] enjoyed by the cattle is comparatively rare.

In the Auin region the plain dominates the landscape.
133 Primary rocks rise up here and there only along the river banks. So-called dunes give the landscape a gently hilly character, especially in the vicinity of the rivers (dry river beds which carry water only after violent rains). The ground cover alternates be-
137 tween grass, shrub, and tree steppe and dense undergrowth. The
132 amount of precipitation is very small; the lack of sufficient statistical data makes it impossible to give a more precise estimate.

B. Dwellings and Furnishings

342 The typical form of the dwelling is the windscreen, in other words, the most primitive form of human habitation, which scarcely deserves the designation "hut." Its construction is completed in a few minutes. A few twigs are stuck loosely into the ground at the thicker end in a semicircle and propped against each other at the branching end. I have never seen the supports firmly fastened to one another, although I have examined several hundred huts. Grass is thrown on the framework, and the construction is finished. During the dry season the structures are usually built even more hastily and sometimes consist merely of a few bundles of grass that have been thrown loosely between the twigs of a living bush. The entire structure is often scarcely a meter high and has no roof. It is thus a genuine windscreen, intended to protect its inhabitants from drafts while they are lying down.

If the settlement remains at a particular place for only a few days, the people content themselves with the shadow of some

/138 cont./

342 bushes and dispense altogether with any construction.

Tree houses are unknown. In any case, they would be possible only in the Kaukau Veld (baobab), since in the Auin region proper the trees are too weak for this purpose.

Each woman has her own windscreen. If she does not have one, she will live under a special bush.

[882] Young girls and young unmarried men sometimes live in special "girls' houses" or "bachelors' houses," separated according to sex.

34 Any kind of special buildings, like meeting houses, storage rooms, and so forth, are unknown.

514 There is little neatness in the vicinity of the huts. Special toilets do not exist. The sole consideration with regard to evacuation is to be hidden from sight. One finds great accumulations of feces away from the main direction of the wind. The practice of burying excrement, common among the Herero, apparently does not occur.

768 The pontok (windscreen) is by no means a valuable possession. After the owner's death the entire horde leaves the locality. Hence any question about the inheritance of the hut is an empty one.

342 There is no door, and it would not be easy to attach one, considering the construction of the hut. In this connection it should be mentioned that things are left carelessly lying around in the settlements, even when all the people are absent. In any 685 case a theft would be paid for with the death of the thief. Since [151] the Bushman knows the footprints of every person in the region, the culprit would always be found. In this respect the Bushman operates as reliably as the best police dog.

352 They lie upon grass covered with a few tanned hides. There 513 are no other household furnishings.

/139/ C. Food

372 The doro (fire-making instrument) (Fig. 1) consists of two round sticks of the Burkea africana. Several round, flat hollows

[as shown in original text]

/139 cont./

372 are made in one of the sticks, and the rounded end of the other stick fits into them. [Figs. 1, 2, and 3 appear here.]

The first stick is placed on the ground and held down with both feet. The other stick is placed with its round end in one of the hollows, and it is twirled as rapidly as possible between the flat palms of the hands. As can be seen in the picture Photo. 19), the hands slide downward during this process, and frequently a second man immediately starts at the top when the hands of the first operator have moved all the way down. A kind of tinder of thoroughly dried birds' nests (weaver bird?) is placed around the bored hole. The fine dust from the twirling begins to smoulder after a few minutes, and the tinder is then fanned to a flame by blowing with the mouth.

[622] The "captain" (aichab) of the settlement sees to it that the fire does not go out. A "sacred" fire does not exist. Keeping the fire from going out is a matter of sheer practicality since twirling to make fire is, after all, fairly strenuous.

354 A few stones, which, incidentally, are not found everywhere in the Kalahari, represent the hearth. In rainy weather cooking is done inside the windscreen.

462 The woman does the cooking while the children help her. In exceptional cases the paterfamilias may busy himself at the cooking fire.

On occasion all the members of a family will go out to get water and wood. Construction of the house is purely woman's work. Bachelors' huts are likewise built by the women of the horde.

415 439 Wooden cooking pots exist. Supposedly they are obtained through barter from the Ambo.

322 415 [439] The Auin either carves primitive spoons out of wood himself, or he obtains them through barter from the region of the Ngami [Lake Ngami?]. Frequently special artists at carving are to be found among the older men. The upper, concave part of a

415 [321] small turtle shell, whose lower, flat side has been cut off, often serves as a spoon.

These shells are also used as drinking vessels, and, along with hollowed-out tschama, they are the only drinking vessels that I found.

/139 cont./

412 Mortars are made of wood and have a stone floor. Their
322 construction is extremely laborious. A block of wood is buried in the ground, stamped down, and then hollowed out with the iron point of the lance or a knife. For this purpose, the iron is sometimes heated. Fire is not used. The wooden pestle is furnished with a stone at one end. The stone on the floor of the
[381] mortar is cemented with tree resin.

[373] Burning branches are used as a kind of torch, but only briefly in the vicinity of the fire.

Photograph 18 illustrates the shape of the mortar and the pestle. The mortar is made of soft wood hollowed out with a lance point. Fire is not used to hollow it out (see above).

Household utensils. Two flat stones to pound hard veld
415 fruit. Spoons crudely carved out of wood. Wooden pot or empty ostrich eggs /140/ with a round hole as water containers. Fre-
[531] quently some kind of decoration is applied. Digging stick
[412] pointed at one end.

Ornamentation. Unfortunately I did not have time to ob-
301 tain more precise data concerning ornamentation. Ornaments
531 are attached to many objects and consist of such things as ostrich eggs and pipe plugs (which are worn on a string around the neck).

Generally speaking, the Auin has three meals a day (morn-
264 ing, afternoon, and evening). If he has enough food, however, he may eat all day long, with the necessary intervals, and, if it is not too cold, even during the night.

There is no special menu. Whatever is available is eaten.
262 The hyena is not eaten because it "devours corpses." The leopard is supposedly not eaten by all the people. The reason for this is unknown to me. The shabrack jackal is frequently spurned because it "is a dog." On the other hand, they like to eat the silver jackal, because it "does not eat vermin."

[858] Young girls who have not yet menstruated and boys before
[882] they have reached adulthood may not eat game meat because if they did, they would "remain skinny."

I have never observed any traces of cannibalism. Further-
266 more, I was told by old, experienced natives of other races (Klipp Kaffir) that they had never heard of Bushmen eating human flesh.

/140 cont./

266 I spoke with a number of elderly Auin about this, and they were by no means indignant at the suggestion. Their reasoning was approximately the following: "Our parents never told us one should eat human flesh. If other old people were to enjoy it, then we could do it also."

In view of the low cultural level of the Bushmen, the absence of anthropophagy is, in my opinion, very striking.

D. Ornaments and Hairdressing

301 The following ornaments were observed.

Among men:

Neck ring, a thin wooden ring made from the so-called rosinkis bush and tied together to form a circle, decorated with lines scratched on it. Arm rings. Three to 20 simple braided rings (see Photos. 3 and 4). The iron beads probably come from [439] the eastern Kaffir tribes. The rings are made from the web of a [237] tree spider (Stegodyphus dumicola Pocock?). A number of strings are bunched together in a ball, and this is "noodled" with the flat of the hand on the upper thigh into strings of the approximate thickness of a knitting needle. The strings are then wound together in pairs and the ring is closed by "noodling together."

Rings around the wrists. The same rings as those worn on the upper arm. In addition, simple rings three to five millimeters wide, made of game leather, as well as individual rings made of [439] iron or copper wire. The latter are said to have been bartered from Batauana.

Lower leg. Some men and women wear one or two leather rings directly below the knee on one or both legs. These leather rings are somewhat wider than the leather rings around the wrists (see Photos. 12 and 14).

Among women:

Head ornaments. Various combinations of chains of ostrich egg shells, as shown in Photograph 20. Sometimes only a piece of such a Molentza chain is braided into the hair of the forehead (see Photo. 36, woman dancing on the left). I also found this ornament on one man.

/140 cont./

301 Earrings of Molentza chain; necklaces of glass beads. Rings on arms, wrists, and legs as among the men.

[756] The "Bushman doctor" wears special ornaments that other people are not permitted to wear. Unfortunately, I was not able to obtain any of these ornaments.

[882] Girls, it is said, do not start wearing ornaments until after their first menses.

[796] All the ornaments are worn for dances and ceremonies. The headdress of the women in Photograph 20 is worn only on special festive occasions.

302 [756] [301] The "doctor" has his head shaved smooth. I did not notice a special hairdress. The men frequently stick individual loose ostrich feathers in the hair, while the women like to braid brass or iron beads into the hair. In addition, the women use a kind of pomade made of various pulverized plant parts which are combined with fat from antelope skin.

Men sometimes cut their head-hair with a knife or a piece of glass.

There is no differentiation in hair style between girls and married women.

[386] The hair is frequently dyed with a mixture of fat and red clay. I am uncertain, however, whether or not this is a means of making the hair fall out in places. On the other hand, in that case there would probably have to be another ingredient /141/ in this mixture that I was unable to discover.

In case a beard is present, which does not occur often, it is neither cut nor removed in any other way.

[142] Pubic hair is sparse and is sometimes shaved off (with a piece of glass). It is said that women have no pubic hair at all.

E. Artificial Deformities

A kind of cosmetic of a reddish-brown color is used by the women.

It consists of a mixture of fat and red clay (see Section D above) and is manufactured by the women themselves.

[535] This cosmetic is regarded solely as a means of beautification and is used especially at festivals (dances).

/141 cont./

302 Men and boys do not use this cosmetic, nor do old women, but only young women and girls.

The mixture is applied in circles on the cheeks (see Photo. 20, woman farthest to the left), but it is also rubbed on the body in any other place possible, such as on the arms or belly. Frequently the entire body is greased with it.

Among men a kind of black grease is used. This has "a pleasant odor," at least according to Bushman notions. It is [756] manufactured by the "doctor." The men smear it under and on the nose. It is questionable whether it is more a means of beautification or of enjoyment.

All male Auin have a green line over the root of the nose, 304 and usually also a crossbar under and at right angles to it. The crossbar is usually not colored (cf. Fig. 4).

Both lines consist of innumerable small transverse cuts. There are almost always two to four deep, especially conspicuous scars in the longer line. The length of the longitudinal line is usually from 2.5 to 3.5 centimeters, and that of the crossbar from one to 1.5 centimeters. Sometimes the longitudinal line is considerably longer and extends to the hairline. In the case of one Auin about 20 years old, no forehead tattoo was observed. In answer to questioning he replied that "it would be done later." On the other hand, I found a forehead tattoo on a quite undeveloped girl who [881] was at most eight years old. Hence it would seem that the tattoo is not connected with sexual maturity, an impression which the Auin themselves confirmed. One woman had two parallel longitudinal lines; another had two lines on each cheek, which in size and execution were like the vertical forehead line. Both were Auin by birth; in other words, they had not married into the tribe.

[177] According to the statements of the Auin, the forehead tattoo was copied from the Betschuana.

The forehead tattoo is called gi. Evidently no special significance is attached to it. Incidentally, I have seen the same tattoo among all the other Bushmen tribes. [Fig. 4 appears here.]

As a tool for making the countless little transverse incisions [412] that constitute the forehead tattoo, any sharpened little piece of iron may be used. I was unable to determine the pigment used to produce the green color, which is indelible.

304

Fig. 4. Forehead Tattoo.
One-third natural size [as shown in the original text].

a, Longitudinal line
b, Crossbar
} Both formed by countless small incisions which are indicated by the lines.

c, Deeper and longer incisions in the crossbar.

Usually green pigment is rubbed into the tattoo.

Boys and girls are tattooed at about 12 to 14 years of age (also earlier and later) and, of course, by the "doctor" or by the "woman doctor." Special ceremonies or the like are not observed on this occasion, but the operation is performed in the bush away from the settlement. As many young people as possible come from several settlements to be tattooed, but in any case this is only for practical reasons. On this occasion
527 festivities are also held, that is, eating and dancing, but these festivities are only indirectly connected with the tattooing. Whenever several /142/ Bushmen are together, if they have

/142 cont./

527 ample food, they always "celebrate."

The tattoo artist receives no special fee; he is simply pro-
304 vided with food and shelter.

When the forehead tattoo is applied, the patient lies on his back with his head slightly raised. The skin of the forehead above the root of the nose is folded together and drawn up by a man using his thumbs and index fingers. The tattoo artist then makes the little transverse incisions in this fold of skin.

Among men, decorative scars take the place of a hunt record.
[224] For each piece of big game that a man has killed, he wears a horizontal decorative scar, on the right upper arm for male game and on the left upper arm for female game.
[858] Only boys, not men, have scars made for small game (duiker, ibex). Older successful hunters finally dispense altogether with having scars made, after they have enough of them to display.

These decorative scars are made in a manner similar to that used for the forehead tattoo. Sweat (blood) from the killed ani-
[237] mal is always rubbed into them, and usually also the green pigment. The hunting scars are made by any one of the older men. The length of the scars is approximately one-half to one centimeter, the breadth approximately one-quarter to one-half centimeter.

Decorative Scars (or Tattooing) among Women

Green decorative scars on the upper thigh and buttocks up to the waist are worn by all women. These scars can be seen in Photograph 14.

[887] The scars are made in the same way as the forehead tattoo, except that older women make them.

Further investigation was impossible since the Bushmen are very suspicious regarding their women. I am quite content to have succeeded in taking at least one photograph which illustrates these decorative scars tolerably well.

Men and women pierce their earlobes in precisely the same way as is customary among us.

Circumcision is not practiced.

According to statements of the Auin, the labia minora are sometimes clipped.

/142 cont./

304 Also, in rare cases the labia minora are supposedly stretched by pulling them with the hand.

F. Clothing

291 The clothing of the Auin can be seen in Photographs 25 and 26.

Men's Clothing

a) Cap made of hide (jackal, jumping hare, Erdmännchen [field mouse?], cat).

a[1]) War cap made of the hide of the aardwolf (see also Photo. 21), only worn in war.

b) Loincloths, always made of ibex hide. A string runs from the loincloth back through the buttock crease and is fastened tightly to the hip band from which the loincloth is suspended in front. The entire contraption has somewhat the same effect as a suspensory in that the scrotum is raised somewhat (see Photos. 9-11).

c) Cloak, always made of ibex hide.

[415] d) Collecting bag, always made of ibex hide.

In addition, one often sees sandals made of the hide of a large antelope, or sandals for running (see Fig. 5). [Fig. 5 appears here.]

Further, there is a kind of fan consisting of a jackal tail [293] fastened to the end of a stick, as well as gaiters made of antelope skin. The latter are /143/ worn by men and women, particularly in thorny terrain. In shape they resemble the Greek greaves.

Women's Clothing (see Photos. 27 and 28)

a) Head ornament. On less festive occasions, a cap styled like the men's peace cap is often worn instead of the head ornament. Usually the head is uncovered on top.

b) Modesty apron. As can be seen in Photographs 12 to 14, this consists of a bundle of leather strips suspended from a string

[Text continues on page 19]

Fig. 5. Sandals

Fig. 5a

Fig. 5b

Fig. 5c

Fig. 5a. A sandal for running, viewed from below: a, flat part; b, tip bent under; c, back part bent under; d, edges bent under; e, holes for the thong fastenings.

Fig. 5b. Fastening of the sandal.

Fig. 5c. Side view of a sandal for running: a, flat part; b, tip; c, back; e, holes for the thongs.

The sandals for running are attached under the ball of the foot and in size exactly fit it. The entire sandal is bent downward in such a way that it increases the thrust of the body when the foot pushes in running. It is made of very hard gemsbok leather.

/143 cont./

291 around the hip. The modesty apron with ostrich egg shell ornaments shown in Photograph 12 on the woman farthest to the left is supposed to have been traded from Makoba [the Koba?]. I have never seen a back apron.

c) Cloak of duiker or ibex hide. This always covers the buttocks.

d) Collecting bag (like the men's bag).

f) Digging stick.

Children's Clothing (see Photo. 22)

Girls: modesty apron and cloak.

Boys: loincloth and cloak. A collecting bag is carried by
[415] both boys and girls.

The children receive the loincloth or modesty apron when they are about five years old.

The articles of clothing are sewed. Holes are drilled with
294 an iron awl, made of any little piece of iron picked up somewhere,
[412] or with a bone splinter. The sewing is done by drawing animal tendons through the holes.

123 When I photographed some Auin women in the nude (1), I had
834

1. I am fully aware that the following is not to be regarded as a "denial of the sense of shame." I have mentioned the matter here simply because I could not fit it in elsewhere.

to take care that all the Auin men, who incidentally, had given their consent, were removed. Several Whites and Herero, on the other hand, were allowed to remain.

G. Weapons (see Photos. 25 and 26)

411
[412] f) Digging stick, also used for beating and as a throwing club.

g) Bow and arrows.

h) Throwing lance.

/143 cont./

411 All the weapons are both tools for warfare and for hunting,
and in a sense they are also used for sport since contests are fought
[526] with them. [Fig. 6 appears here.]

Fig. 6. Lance Points. One-half natural size [as shown in original text].

Fig. 6a Fig. 6b Fig. 6c Fig. 6d

[831] Fig. 6a. Iron point: a a, barbs. This is a "male" point; the barbs are the "testicles." The other lance points are "women," because they have no testicles (that is, barbs).

Fig. 6b. Lower end of a lance shaft, showing the tapering of a shaft at the lower end.

Fig. 6c. Iron point attached to the shaft: a, cover of sewed leather; b, iron part; c, iron part that is inserted in the shaft; d, wooden shaft.

Fig. 6d. Upper end of a spear: a, iron point; b, wrapping at

/143 cont./

411 the upper end of the shaft (strips of leather or neck tendons of a large antelope); c, shaft.

/144/ With the exception of the iron point of the throwing lances, all the weapons are manufactured by the Auin themselves.
[439] The lance points reach the interior of the Kalahari from Lake Ngami through trade.

411 The lance point (see Fig. 6) is the Bushman's most valuable
435 possession. One hardly ever sees such points in a settlement, even if he comes unannounced, but only the shafts that go with them. In this respect the Bushman is so suspicious that even within the settlement he always hides the points, usually by burying them.

[422] Every adult Auin possesses one or more spears.

The iron point is inserted into the wooden shaft somewhat
411 loosely so that it can easily be taken out. The upper end of the shaft is wrapped with a strip of antelope skin or antelope neck tendons. The point also serves as a tool for handwork in place of a knife.

When the lance is carried, for which a leather strap like a
[482] rifle sling is used, it is commonly protected by a small leather cover (Photo. 25i). [Fig. 7 appears here.]

The manner of holding the bow and arrow when shooting seems to be fairly arbitrary. I have recorded the most common methods pictorially (see Photos. 29 to 32).

The bowstring is made of animal tendons twisted together. The strings were always pushed up on one side and fastened at the other (see Figs. 7a and 7b).

Composite bows do not exist.

The arrows are made exclusively from reeds which merely need to have grown straight to supply the ready-made arrow shaft. At the upper end, where the loose arrowhead is inserted, and at the bottom, where a simple, ordinary notch is made, the shaft is always wrapped with a flat, narrow grass band. Sometimes places in the middle of the shaft are wrapped. The length of the arrow shaft varies between 48 and 52 centimeters.

Feathered arrows do not occur.

The art of making arrows and arrowheads is a common posses-
411 sion of all adult Auin. There are no special arrow makers.
463 An exception to this is the manufacture of iron arrowheads, which is practiced only by some individuals, usually older persons.

/144 cont./

411

Fig. 7. Ends of the Bow. One-half natural size [as shown in original text].

Fig. 7a. End with the Bowstring Drawn Up: a, bow; b wrapping of tendons; c, string which is drawn up with a simple noose.

Fig. 7a

Fig. 7b

The arrowhead is a work of art carried out with the most meticulous care.

The bone arrowhead is supposedly made from ostrich bones. I am unable to name the tools used.

By means of the drawings in Figure 8 I have tried to give as graphic a picture as possible of the arrows and arrowheads.

Usually the arrows are carried together with the bow in a

/144 cont./

411 quiver. Sometimes the arrows are in a special quiver made of
[237] eland horn or bark, which is closed off at both ends with a leather cover (see Photos. 29 and 32).

The Auin almost always carries in his quiver a small container like the arrow quiver of eland horn or bark just described, in which he keeps arrowheads, poison, and other small necessities for shooting.

The notched end of the arrow is pulled toward the chest when the bow is drawn.

714 The war cap is to be regarded as the sole battle ornament. It is made of aardwolf hide (see Photo. 21).

H. Hunting and Agriculture

224 Hunting is done both individually and in groups.

Hunting dogs are to be found in occasional, isolated instances,
[231] but then they are usually obtained from the Kaffir or Betschuana.
[439] The Auin maintain, however, that they know how to train hunting dogs. Collars and the like are not customary.

/145/ [Fig. 8 appears here.]

[422] I was unable to discover whether marks of ownership are applied to weapons and the like. On the other hand, I noticed that people immediately recognize their possessions.

There are no closed seasons on hunting.

The Auin prepares a kind of dried meat. Pieces of meat of any
251 length and width are cut very thin (almost transparent) and are dried on trees in the sun. This dried mass, as hard as wood and inedible to a European, keeps for weeks during the dry season. There must be an almost unlimited surplus of meat available, how-
[264] ever, if the Auin is to decide to preserve some, since he is accustomed to stuff himself to the point of unconsciousness. I have seen a single Bushman, without any help, consume a fully grown Klipbok weighing about six kilograms.

224 Undoubtedly there are especially industrious and impassioned huntsmen, as well as the opposite. I found some people who were absolutely useless on the hunt.

[Text continues on page 25]

Fig. 8. Arrows and Arrowheads.
One-half natural size [as shown in the original text].

Fig. 8a shows the connection between the ends of the two points: a, bone spindle covered with a layer of poison; b, reed connection which is wrapped with a strip of grass; c, bone spindle without poison that is inserted in the shaft.

Fig. 8b. Upper end of an arrow shaft with poisoned point inserted: a, poisoned point; b, unwrapped reed connecting piece; c, bone spindle to be inserted; d, arrow shaft; e e, wrappings for the shaft (grass).

Fig. 8c. Arrow with bone point inserted: a, bone spindle; b, wrapping of the upper shaft; c, shaft.

/145 cont./

224 The main method of hunting is to stalk the game with bow and poisoned arrow. It is unnecessary, I believe, to emphasize that the Auin, like every Bushman, is an unsurpassed master of this art. He usually shoots at a distance of only a few paces. This manner of hunting is applicable to almost every type of game.

In the following I shall describe how the Auin customarily kill the main types of game. I have omitted stalking in those cases where it is naturally also a secondary method of hunting.

Gemsbok and wildebeest. The Bushman stays on the track for days on end and does not give the animal any rest. Finally he hunts it down to finish it off. A large tree branch with many twigs is thrust between the gemsbok's horns. While the gemsbok tries to rid itself of the branch, the Bushman severs its posterior flexing sinews or throws his spear at its shoulder blade.

Overtaking a gemsbok on foot sounds very much like a hunter's exaggeration, but the physiological explanation is that the Bushman simply does not allow the animal any rest for digestion and ruminating. After several hours an inflammation of the stomach sets in, which makes the animal almost incapable of movement.

The other large animals, such as the giraffe, eland, hartebeest, ostrich, and the springbok, cannot be approached in this way, and for them the Bushman confines himself to stalking. The small /146/ bucks can only be finished off when they are mired in wet ground.

[223] Guinea fowl are stealthily approached and killed by stones or a stick thrown at them.

The aardvark is dug out. The Bushman, however, tackles this laborious job only if the aardvark cannot go too deep, in other words, if it is suspected that rocky subsoil lies below the sand. For this purpose he uses a spade (obtained from the Whites) [177] which is usually the common property of the settlement. How he could accomplish it without a spade is unclear to me, since the aardvark digs about as rapidly as a practiced workman with a spade.

The porcupine and the anteater are likewise dug out.

Hares are hunted by throwing sticks at them. Hunting them, however, is said to be only rarely successful. Usually a small

/146 cont./

224 pitfall is put on the trail. I have never seen larger pitfalls for big game in the Auin region.

The jumping hare is held fast in its burrow (not pulled out!) [171] and pressed against the end of it with the well-known angling [411] stick of the South Africans, which among the Auin displays no special characteristics. A vertical hole is then dug from above, and the animal is taken out.

Hyrax. The exits of the burrow are blocked and then an opening is made (that is, dug in from the top).

Leopards are hunted only when several keen dogs are available. The animal is then covered by the dogs and killed with spears by several Bushmen. Without dogs, the Bushman dispenses with this sport, which every expert will understand.

The cheetah is pursued on foot by several people until it is exhausted and then killed with clubs and spears.

Hyenas are not hunted. They are smoked out only when a brood with young animals has been found in a hole in the ground, and the asphyxiated animals are then dug out.

The aardwolf is suffocated in his burrow by smoke and then dug out.

The jackal is not hunted since the Bushman supposedly does not get it anyway.

The wild dog (Lycaon pictus) is not hunted. I believe that in case of an encounter between the two the Bushman himself would usually constitute the game.

In isolated cases the skin of an ostrich, with a stick placed [237] in the neck, is used as a mask. The hunter slips into the skin after he has colored his legs with chalky soil. This mask is used [223] for hunting ostriches as well as other types of game.

The Bushman is unable to make other masks since he cannot [281] soften the skins of larger animals without changing their natural appearance. At the same time, the Auin described other masks to me so accurately that I could not doubt that their manufacture and use was known to them.

The characteristic sound of the young springbok, duiker, and klipbok is imitated with the lips while the nose is held with the index and middle finger.

The frightened scream of the young gemsbok and wildebeest is likewise imitated.

/146 cont./

223 In addition, hiding places are set up near ostrich nests in order to note the time when the young animals creep out of the egg. If the Auin wants to kill the ostrich hen in her nest, he waits for a moment when the hen has left the nest and sticks an arrow into the ground between the eggs, with the poisoned point upward. When the hen sits down to hatch her eggs, the poisoned point pierces her body and she dies after a few seconds. This perfidious form of hunting is the reason that one encounters many more ostrich cocks than hens in the Kalahari.

224 Hunting drives are used for gemsbok, wildebeest, hartebeest, and springbok.

Hunting by fire is unknown.

The following animals are caught with snares: ibex, giant [223] bustard, duiker, ostrich, guinea fowl, Koran [?], aardvark, jumping hare, ground squirrel, sand grouse, Greek partridge, smaller species of cat, and small antelopes.

A snare is matter-of-course for animals that inhabit caves, for example, the aardvark. It is placed around the entrance and fastened to a tree. The animal then draws the snare up tight when it goes in or out of the cave.

223 224 For fowl and small bucks, long, special trails which the animals are forced to use are constructed of thorny shrubbery and provided with narrow openings. If the animal tries to go through the opening, its neck is caught in a snare. Bait, of course, is not necessary. Such special trails, of which I have seen specimens as long as 1,000 meters, by no means constitute an impassable corral; rather, they are constructed of very low branches, loosely lying next to one another, which the game could jump over without any difficulty. Generally, however, the animal ambles along such /147/ a trail until it finds a convenient opening.

223 Ostriches, giant bustards, Korane, guinea fowl, sand grouse, and Greek partridges are caught by means of the spring trap. A little tree, whose strength depends upon the game to be caught (for the ostrich, naturally, it has to be fairly strong), is bent down to the ground and held by means of a string. The string ends in a noose which is fastened to the ground with wooden pegs. Bait (usually a ball of resin) is put in the middle of the circle formed by the noose. By means of a simple connection, the

/147 cont./

223 noose is released when the animal takes the bait, and at the same time the gallows springs back and pulls the animal up in the air by its neck. Concerning the material used to make the noose, see page 41. The arrowheads of the Auin are generally
411 poisoned. I have also found arrows which had only a single unpoisoned bone point. These are used for sport, perhaps also for killing small birds.

Manufacture of the arrow poison. Burkea africana (firewood
278 of the Bushmen) is inhabited during the rainy season by a beetle (or a species of termite?) which toward the end of the rainy season pupates in the soil under the tree. The larvae are dug up, killed, dried in the sun, and rubbed between stones.

Roots of the thorny tschamma (Cucumis heptactylus Naud.) are laid on red-hot coals, taken out warm, and the bitter sap pressed out. This sap is mixed with the poisonous paste, and the resulting dirty, reddish-brown preparation represents the finished arrow poison. The poison is applied to the arrow point in a layer several millimeters thick and dries there.

The Bushmen greatly fear their own arrow poison and always
278 carry the poisoned point hidden in the shaft. The poisoned end
411 is exposed only just before it is to be used. The layer of poison on the iron points, which because of their width cannot be concealed in the arrow shaft, is always wrapped with bast which is not taken off until the arrow is to be used. All Auin can make arrow poison and readily demonstrate the process.

224 The decorative scars described on page 16 are to be regarded
304 as hunting trophies.

The hunters supposedly tell exaggerated tales. Quarrels on
521 these occasions sometimes end in bloodshed.
578

The only domestic animal is the dog.
[231]

The Bushman doctor is supposed to let blood for healing pur-
757 poses. For instance, in the case of a man who could not run well, bloody incisions were made in his upper thigh. On the other hand, I do not know whether this procedure can be described as "bloodletting." Scars from such incisions were shown to me several times.

413 The surgical instrument is a little sharpened piece of iron.

/147 cont./

241 Agriculture is unknown. Only accidentally grown food plants are known.

In order to promote the growth of the veld crop, the Bushman
222 burns off the grass. A Bergdamara with whom I rode across a
311 burning grass veld said to me: "The Bushman is making his garden."

462 Work of the men:

Hunting
Occasional veld crop gathering
Collecting wood
Fetching water
Preparing hides
Making clothes
Making weapons and mortars
Making strings
Making fire by twirling

Work of the women:

Hut construction
Cooking
Veld crop collecting
Maintaining the fire
Getting wood
Getting water
Making women's clothes

The only "agricultural implement" is a digging stick
412 (see Fig. 9).

For one who is not a botanist it is impossible to describe in
222 intelligible terms, even roughly, the numerous wild food plants of the Auin. The collection of specimens must take the place of a description. Unfortunately, I had no opportunity to make such a collection.

For the person who is familiar with the Southwest African veld crops, I shall give a list of some food plants, which, however, is by no means exhaustive.

Tschamma
Spiny tschamma
Ontjes of the Boers
Water tubers
So-called "wild potatoes"

/147 cont./

222 Rosinkis of the Boers
So-called "wild cucumbers"
Mushrooms which grow on termite hills

251 The veld crop that has been gathered is kept in the huts in
[415] little sacks made of duiker or ibex leather.

/148/ The Auin also stores small caches of provisions by burying sacks of veld crops; he likewise buries tschamma or ostrich egg shells filled with water. In the tops of large trees one often finds, aside from animal hides, provisions of veld crops which are kept there. [Fig. 9 appears here.]

423 Land is held in common, that is, it is the common property of a horde consisting of several families. The game in this territory, as well as the wood and the veld crops, is exclusively for the use of the members of the community that holds the land. The watering places that are to be found there are available for general use, but only if water is abundant. If water is scarce, the local group that holds the land has exclusive right to it.

361 The local groups sometimes live at considerable distances
423 from one another so that the same land is used by several settle-
621 ments. The settlements, after all, do not consist of a fixed number of families, but rather of those who are gathered together in fortuitous groupings as the occasion arises. Whatever the accidental composition of the settlements may be, their members always move within a definite area, and it is always the members of the same larger horde who form the settlements.

423 Friendly hordes permit tracking, that is, game that has been
619 wounded on the land of one horde may be pursued on the territory of a friendly horde. A part of the booty is allotted to the "landowner" within whose territory the game is killed. A definite
[685] agreement is required in each case since the Bushman attacks on sight any strange Bushman on his family's terrain.

628 Blood vengeance is not sought for a violation of territory if the local groups are especially friendly. The offender is driven off and, in addition, just as in Prussia, his "firearms" and booty are confiscated. The policing of the terrain is done by each Bushman on his communal land.

If women are caught trespassing, they are taken prisoner and
[721] led to the settlement of the owners of the terrain. This frequently leads to war if the women are harmed sexually during their captivity.

/148 cont./

628 captivity. Blood vengeance is exacted by the Bushmen for
684 adultery under all circumstances.

J. Luxuries

276 Tobacco, which is exclusively an imported product, is
[439] greatly coveted. A pipe of tobacco is the Auin's greatest pleasure. [Fig. 10 appears here.]

Taking snuff is unknown.

Everybody smokes, including little children.

The Auin manufacture a tobacco pipe (see Fig. 10) from a
324 soft red stone (serpentine) which supposedly is found only at the watering place Korikas. Indeed, immediately above the source, one does find a kind of modest quarry there.

/149/ A fragment of this stone is conically hollowed out with a lance point or an iron knife and then shaved down on the outside toward the hollow until the wall is about two to four millimeters thick. This pipe resembles an ordinary conical cigar
276 tip. A wadding made from the nest of the weaver bird (?) prevents the tobacco from falling out.

Occasionally one will also see a pipe plug or cleaner which usually is made of rosinkis wood without the bark and is attrac-
[531] tively decorated with a kind of pyrography. The decoration consists of lines and dots scratched in with a red-hot needle. The hairline precision of the lines is particularly striking.

The pipe plug (see Fig. 11) is worn around the neck on a chain of glass beads or on a leather belt (see also Photo. 1, the second man from the right).

The Auin only occasionally receives tobacco, either from
[439] the Whites when he performs services for them as a messenger,
[648] guide, and the like, or from Kaffirs employed by Whites, who exchange it for veld food.

Hemp or dacha of the Kaffirs (haium of the Auin).

Hemp is smoked in the ordinary tobacco pipes with equal passion by men and women.

I did not see anyone who had become ill from smoking hemp. The Auin themselves were only aware that its enjoyment sometimes produces nausea.

276
531

Fig. 11. Pipe Plug. One-half natural size [as shown in the original].

An example of Auin decoration.

The design is scratched on the wood with a needle; the dots are pricked in.

a^1, side view
b b, long part
c, point
d, side view of the point

The Bushman second from the right in Photo. 1 is wearing the pipe plug around his neck.

276
439

The hemp is cultivated by the Kaffir in Oas, by the Betschuana in Chanse Veld, and probably also by White farmers. The Auin acquire it through barter.

249

The Auin maintain, furthermore, that they are capable of growing hemp themselves. This "cultivation" is done in the following manner: in soft sandy soil a circular area, 30 to 40 centimeters in diameter, is surrounded by a little dam a few centimeters high. Using one finger, ten to 15 holes are made in the area surrounded by the dam, and a hemp seed is placed in each hole. The "seedbed" is then kept well under water.

/149 cont./

249 The Auin have copied this procedure from the Bergdamara of
[177] Oas.
[273] The process of fermentation is unknown.
[i.e., of growing hemp.-Analyst]

K. Toys, Games, Sport

524 Little bows and arrows serve as children's toys.

A Chinese puzzle game is played by young and old, men and women alike. I have chosen the above designation because of the nature of the game.

The partners sit opposite each other in a crouch.

Both tap their thighs with both hands in rhythmic alternation and at the same time murmur meaningless inarticulate sounds.

One partner then suddenly extends his right or left hand toward the other or makes some other kind of motion with his hand. The point, now, is that the opponent must immediately extend the same hand or respond to the given motion with a similar one; in short, he must not allow himself to be confused. [Fig. 11 appears here.]

If, for instance, the opponent motions with the wrong hand or makes any other mistake, his partner very briefly signals his advantage by making a throwing motion with his hand or by striking his right index finger on his left fist (intended to signify: "I am breaking his, that is, the opponent's, head in two"). The game is not interrupted by these rapid signals.

/150/ The entire game is played at a fairly rapid speed.

Sometimes several men sit across from one another and take turns in the matches. Even little boys take part in the game of the adults.

[171] The Herero and Bergdamara play a similar game. The Auin, however, maintain that it is an original Bushman game.

Prizes are not awarded. They play purely for the "glory."

525 Game of chance: this bears great resemblance to the Chinese puzzle game, except that the participants also tap the ground with their knees. The "killing," that is, defeat of the opponent, is indicated by a loud exclamation without interrupting the progress of the game. The stakes (for instance, tobacco, food)

/150 cont./

525 are placed between the players and taken by the winner, but since the luck often changes during a match, the same prize passes back and forth frequently.

I have seen this game played only by two men (not by women and children). One finds especially passionate players

524 among the Auin, in particular among older men.

535 Dancing game of the women (goei) (see Photos. 36 and 37).

I am in doubt as to whether I should classify this under games or dances.

A number of women line up along a tree trunk lying on the ground. All of them in rhythm alternately place the front part of first the right and then the left foot on the trunk. It proceeds in this fashion, slowly at first, then ever faster. If the women have their backs turned to the tree trunk, they place their heels on it in the same fashion.

Sometimes also two rows of women will face each other.

[533] Frequently, a kind of rhythmical singsong is also uttered by them.

The game is begun with everyone calling out //ai, meaning something like "let's go."

In some dances bucks' horns are tied in front of the forehead (eland bull dance). One can hardly designate these as true masked dances, however.

The Auin are acquainted with stilts, which are used by men

481 and boys. I might mention that I did not see any, but when I described them the Auin seemed to be very familiar with them.

526 Foot races (gâ).

The runners line up in a row, and at the word "gâ" they all run. The winner obtains a prize of food or of some useful object (for example, a knife).

Older people act as judges. Bloody quarrels are said to occur

[578] when the prizes are awarded.

Stick throwing (gai or albi).

Thin sticks of any length up to two meters and taken from the rosinkis bush are thrown forward with a whistling swing and from a running start (they are not flung like a spear, but grasped at one end). The object is to throw as far as possible. No prizes are offered; hence it is a real sport. Since it is fairly strenuous, this game, like all the others, incidentally, is played only when

/150 cont./

526 there is a good supply of food, in other words, only during the crop season (rainy season). Sometimes, also, a heap of sand about one and a half meters high is piled up and one must throw over it.

The game is played for hours by boys and men with great shouts of joy.

[171] [177] This sport[1] is likewise practiced by the Kaffir and Herero. The Auin state that it is not an original Bushman game.

Wrestling (see Photo. 34). This seems to have a somewhat more serious character, since the victor deals severely with the loser and has nothing to do with him for a long time. Nonetheless, the Bushmen designate it as a game.

Shooting with bow and arrow (unpoisoned arrow tip toward the front). The target is a tschama or any other soft object, in order to spare the arrow. One by one, the competitors shoot from the same place. The winner receives a prize (food, a knife, or the like).

Spear throwing. The target (tschama) is placed on a stick planted in the ground.

At a distance of 20 meters, only one throw out of 30, performed by six men, hit the target.

The target was an insert from a flour box.

Prizes are offered.

Riding (see Photo. 35). Two men form a "horse," the third "rides." (Gabi, "to ride.")

[1] [i.e., of stick throwing.-Analyst]

L. Music

534 Musical bows of various sizes made of "rosinkis wood" with animal tendons. The striker is made of any kind of wood.

I have a suspicion that the two Auin in Photograph 38 cheated a bit, because one of them has a shooting bow while the other has taken up any old stick. It is likely that just at that moment they had no proper musical bow at hand. At the same time, of course, it is true that one can make "music" on any strung bow. This music, by the way, is clearly audible to other people, not only to the player.

533 /151/ There are no special musicians. On the other hand, one does find certain individuals who clearly take more joy in

/151 cont./

533 music than others. I have observed a man who played his musical bow in every spare moment.

Rhythmic hand clapping accompanies singing.

534 237 Dance rattles (guri) are made of the cocoons of a night butterfly. These cocoons are strung on strings and dried. While the cocoons are still soft, little stones or pieces of ostrich egg shell are pressed into the inner cavity and the soft envelope is closed over them (see Photo. 39).

The rattles, when they are dried and hard, are strung and 535 fastened to the ankle. They are supposed to be used at all dances.

War dance (see Photos. 41 and 42).

The women sit or stand, clapping their hands and singing, while the men crouch or stand opposite them. One man slides out of the row on his knees toward the row of women and makes war-like gestures, as though he were evading an arrow, flinging a spear, etc.

One of the women thrusts out an arm and utters a brief, deep cry, thereby indicating that a spear has been thrown or an arrow shot. The man pretends he is wounded and screams. If he is "dead," he crawls back, and a new solo dancer takes his place. Women, too, are sometimes "dead" or "wounded."

Indecisive battles are indicated.

Here, too, there are very passionate dancers, both male and female, as well as those who have a special talent for mimicry.

The porcupine dance (see Photo. 40) is performed only by men. A number of men stand facing one another, stamp the ground rhythmically, and utter loud shouts. One of them is the "porcupine," which is beaten to death by another man or stabbed with a spear. Everything is indicated by motions.

Eland bull dance. I was unable to learn the nature of this dance, but apparently the rutting lust of the eland is imitated.

M. Means of Transportation

487 Bush paths are formed by the Bushmen on the main lines of traffic, for instance, from the settlement to water. When a 648 Bushman uses the pad (that is, the road of the Whites), he has an

/151 cont./

648 unusually good conscience. In this case he usually is engaged on a messenger's errand. As a messenger serving the Whites, he may even traverse the territory of a hostile group (always on the highway!), without anything happening to him. This is a concession which the Bushmen make to our superiority.

N. Trade, Money Substitutes, Weights and Measures

438 Trade between friendly groups or settlements is carried on by a fairly small troupe of men and women (a larger troupe would create the suspicion of hostile intentions) going to the settlement with which they want to trade and first laying aside their weapons. Then they ask for permission to enter the settlement.

[619] If two settlements are hostile to each other, which incidentally seems to be the normal state of affairs, women sometimes nevertheless go to the hostile village to trade. Trade is wholly barter.

Despite their primitive nature, these trade relations are territorially very extensive and are carried out through various intermediaries all the way from the Zambezi to the Orange River. It goes without saying that the Auin himself never goes that far.

It appears that in relation to other Bushman tribes the Auin is quite unproductive. For instance, the Kung manufactures the highly valued and profitable ostrich egg chains, and the Noroon [Naron] makes and trades hide clothing and bone arrow points, whereas the Auin appears to be exclusively an intermediary and in this way gains possession of the coveted objects.

I did not get the impression that the Auin trades goods with the express intention of exchanging them further. Rather, it seems that he first acquires the trade items for his own use and later exchanges them again when the opportunity presents itself.

The chief articles of exchange are: salt (from the Noroon), bow and arrow, points for the throwing spear (Makoba), wooden pots, wooden bowls, wooden spoons (apparently from the Ambo or Owakwanguari by way of the northern Hai//um [Heikum]), European store goods from the Aikwe [Naron] of the Chanse Veld.

Within the settlements the following articles are the chief

/151 cont./

438 objects of exchange: veld food, meat, articles of clothing, and utilitarian objects. It appears that barter is also carried out in a smaller circle. To the "child of the moment," something different is always preferred.

[443] Markets are not held.

The chains of ostrich egg shells have a certain fixed value [435] since they are highly coveted. A leaf [Platte] of tobacco likewise has a fixed value.

/152/ This means that under all circumstances, wherever [436] one goes, both tobacco and chains can be traded. Only in this sense is it possible to speak of money substitutes. I am convinced that with a sufficient number of tobacco leaves [Plattentabak] in one's pocket, and without any provisions, one can live by barter, that is, if the Bushman himself happens to have anything.

The only things that one might not be able to obtain from the Auin in exchange for tobacco are lance points.

The Auin is unacquainted with our custom of indicating 804 length with two fingers of one or both hands. Length is indicated by pointing with one finger to the index finger of the other hand or to a stick.

A "fathom" is indicated by extending both arms, in a manner similar to ours.

As a "dry measure" they use one or both cupped hands, the latter held close together.

Another dry measure is made by crooking the arm and filling the hollow between the arm and chest with a cloth, or both arms are crooked with the hands fastened together in front of the body and the hollow is filled with a cloth.

We also have the saying "an armful."

The hide cap is also used for measuring.

As rough as the measures are, they nonetheless appear to have a certain, though naturally quite inexact validity. I have observed how a Bushman exchanged "an armful" of veld food for tobacco. The owner of the tobacco did not deem the goods he received sufficient, and the other had to add "a handful."

Weights are estimated. Naturally, an object for comparison is always present.

Weights are estimated, as among us, by briefly lifting the weights to be compared, one after the other. Even the accompanying

/152 cont./

804 reflective and sly facial expression is exactly the same as ours.

O. Techniques

439 511 A definite domestic industry is present. Whatever the Auin really needs, he is able to manufacture for himself. All imported objects are luxury items. I make an exception in the case of the iron lance points, but I believe that if necessary the Bushman could even do without them.

463 The beginnings of a division of labor can be seen in the fact that only certain individuals practice the smith's trade, which, incidentally, does not extend to the manufacture of lance points.

323 Pottery is unknown.

439 Pots, supposedly from the Okovangga, are to be found sporadically. The Auin, however, is unable to repair such a vessel, as by puttying.

285 Rings of braided grass are manufactured. I myself have never seen them, since they are only made of young, but no longer green grass, in other words, shortly after the rainy season.

[294] It is said that at the same time of year certain special artists braid hat-like head coverings.

The grass rings and hats have only a limited durability, for in September and October there was none left for me to see.

[415] Sieves are made of parallel grass leaves joined together by thin strings. They are used to strain food.

"Kirris" are made with attractive decorations (Fig. 12).

413 531 A root stock with a knotty end is peeled and made smooth. A kind of pyrography is practiced on it by wrapping it, leaving bare spaces, with a long strip of the wet bark that was peeled off, and then placing the entire stick in red-hot coals. The unwrapped parts burn to a black color, while the other parts remain white.

I could not learn the purpose of these decorated sticks among the Auin. They use rough, pointed sticks for digging sticks. The kirris, therefore, seem to be luxury articles.

412 Iron knives, sharpened pieces of iron, or lance points are used as tools. As an example of pyrography, see the pipe plug, page 33.

/152 cont./

415 Mortars and pestles, as well as spoons of wood, are made (see Photo. 18).

[287] Painting and bark working are unknown.

171 281 The preparation of hides is the same as that practiced by the Hottentot, Herero, Bergdamara, and Betschuana. Hence, I shall dispense with a description of the process.

281 386 The women's cosmetic described above is used to dye clothing made of hides. The dye is rubbed on with the ball of the hand and is comparatively waterproof.

To be sure, it is questionable whether this process may be called "dyeing." The hides are already red from the tanning process, and the cosmetic scarcely changes the color. Perhaps it is better regarded as impregnation or greasing.

386 438 /153/ The colored stones that are pulverized and mixed with fat to make the cosmetic are dug up near Kaitsaub (45 kilometers south of Gobabis) by the Hai//um Bushmen residing there, and they constitute an article of trade. [Fig. 12 appears here.]

283 The beautiful and durable cordage of the Auin is made of the fiber of a wild agave. It looks so neat and clean that one might suspect its origin to have been in a European rope factory rather than in a Bushman settlement.

The cords are made in various strengths and are used for all kinds of purposes, mainly for the game snares.

Their manufacture is very simple and proceeds very rapidly. The leaf is softened by tapping with a wooden stick, and it is then placed on a firm base. One hand holds a pointed stick or a blunt knife firmly on the leaf, while the other hand draws the leaf against the vertically held knife and toward the body. After this has been repeated several times, the strong fibers remain and are then rolled together into cords of the thickness and length desired.

Industrial use of Bushman cordage does not seem impossible to me.

412 As a drill, the lance point or an iron knife is used, frequently red-hot.

325 Only pieces of iron found accidentally are worked. The extraction of iron from ore is unknown.

[372] Charcoal made from the giraffe acacia is the preferred fuel for ironworking.

Drawing 2

Drawing 1. Ax with perpendicular edge:
a a, wooden handle; b, root knot; c, iron tip.

Drawing 2. Ax with horizontal blade:
a a, wooden handle; b, root knot; c, iron tip.

[439] The iron blades are obtained in trade from Makoba.

/153 cont./

325 A jackal tail fastened to a stick is used to fan the fire.

[237] A hollow reed serves as a bellows, through which one blows with his mouth to fan the fire. Whether this actually suffices to bring the iron to a red heat, however, I am unable to say.

412 Two rocks take the place of hammer and anvil. Should iron tools, such as an ax or the like, happen to be available to the Auin, these are naturally preferred.

Two pieces of green wood roughly fastened together like pincers serve as tongs.

326 The smiths (only a few, usually older people know this trade) are respected, as is shown by the fact that they are "provided with food everywhere," which is apparently the way the Auin customarily express their special esteem. [Fig. 13 appears here.]

/154/ P. Political Conditions

721 The Auin, like all Bushmen, is very warlike. Every man and youth is a warrior and capable in the use of weapons.

[714] There is no declaration of war, but if a Bushman is wearing his cap of aardwolf hide, he is on the warpath (see Photo. 21).

Special training in the handling of weapons is unnecessary, since daily life forces the Auin to use his weapons constantly in hunting.

726 I myself have not witnessed any of their wars. A reliable Kaffir described an Auin campaign, in which he participated, as follows:

Several friendly settlements decided to join in an attack on another Auin settlement. They put on their war caps and after sundown marched off in the direction of the enemy. They halted in the vicinity of the enemy settlement and, without lighting a fire (this was during the cold season!), waited for morning. After sunrise, when it had become a little warmer, they surrounded the settlement and attacked it from all sides.

My informant related that the Auin had attacked with great determination and had primarily used the lance.

The attack was made with loud shrieks and cries; no special war cry was recognized.

/154 cont./

722 Women were not taken along on the expedition; the women of the settlement attacked immediately ran away.

[622] 701 In time of war the chiefs have general powers of command. Their authority is apparently no greater than in peacetime, when it is insignificant. Indeed, it is scarcely intelligible to us how a war can be carried on effectively under such circumstances.

[888] [756] Old people naturally have greater influence. The "doctor" is merely an accompanying warrior without special authority. Generally speaking, everyone for the most part does what he considers should be done; some co-operation is nevertheless apparent.

There is no fighting at night; at most they will march then.

726 619 Alliances are concluded, even between groups speaking different languages. For instance, men of different Auin settlements will ally themselves with a Naroon [Naron] settlement to attack another Auin settlement.

There is no political connection between all the Auin settlements. They form a single community only by virtue of their common language. For example, bitter hostility exists between the Auin of Gam and the Auin of Rietfontein, while the relations between the Rietfontein Auin and the Naroon settlements south of them are amicable. The two can communicate only through interpreters.

701 Young people who are staying in a given village for courtship participate without ado in the warlike undertakings of this village. I am unable to say what happens in case the undertaking is directed at the home settlement of the candidate for marriage.

Concerning the war dance and the accompanying song, see page 37.

727 Captured men are killed, and usually boys as well (because of the danger of blood vengeance).

Women and children are taken away, married, and completely assimilated into the group. Old women are killed. Objects that are useful are taken away; the rest is destroyed.

It is not worth the trouble to set fire to the windscreens.

728 Hostilities are officially concluded; unarmed negotiators appear to have safe conduct. War damages are paid in the form of food, tools, and women.

The description of the form of government is the most difficult chapter of this account.

/154 cont./

Every Auin adult can really do as he likes on the condition that
622 he does not offend against "good Bushman custom." On the other hand, he recognizes a chief, who, however, has as good as no authority at all. If, however, the chief has a rifle, for example, or if he is a very strong man, he has correspondingly greater influence. I have the impression that the chief acts more as a representative, a position which is of most importance in dealings with the Whites.

The chief has actual sovereign rights, like every other Bushman, only over his wives and children, and over the latter only while they are small.

No tribute or service is rendered, just as there are no external insignia of the chief's office.

The chief's office is hereditary in the male descent group. The office is not inherited until the candidate belongs among the men, that is, after schooling (see below) and after the killing of the first piece of big game. There is no proxy during the minority of the candidate. It works, even so!

/155/ The settlements unite and separate again depending
619 on the circumstances.

The chief of a horde, which is not always united in one
631 village, is called aichabn.

At a gathering of about 1,000 Auin, several chiefs were present. A common supreme chief was lacking.

Evidently it is old families of chiefs that possess these traces of authority. They constitute no special caste and do not belong to a foreign race.

Q. Administration of Justice and Social Conditions

428 The oldest son is the heir of the insignificant legacy, which primarily consists of a few utilitarian objects and hides.

The widow inherits nothing, but she keeps the property she already owns. Younger sons and daughters inherit nothing.

628 Blood vengeance is the basic concept that gives the legal notions their distinctive character. The son is obligated to avenge his slain father; the brother avenges his brother. I was

/155 cont./

628 unable to learn whether these obligations also extend to more distant degrees of kinship.

If the murderer himself has died or cannot be reached, blood vengeance extends to his nearest male relatives.

The sons of a murdered man are obligated to take blood revenge as soon as they are grown.

The mother of the future avenger inculcates this duty in her [867] son as she rears him. As soon as the young man has killed the [884] first piece of game, his obligation goes into effect. He turns [602] to his kinsmen for help, which is immediately granted him. Similarly, the one who has reason to fear blood vengeance finds armed support among his relatives and fellow villagers. One can imagine what a maze of obligations for blood vengeance can arise from this situation.

619 It can happen that two settlements are "saddled" with so many obligations for vengeance that an encounter between mem-
628 bers of these settlements immediately leads to bloodshed. Perhaps this also helps to explain the fact that some villages within the Auin region have for many years been so hostile to one another that a boundary violation is punished by death on the spot.

Example: Auin from Rietfontein and Gam. It goes without saying that a mortal enmity more often exists between Bushmen of different languages, for instance, between Auin and Naroon, or Auin and Genkuin [Ginkwe]. An enmity of this kind evidently does not extend to the group as a whole; instead, it is doubtless always confined to a certain number of families and settlements.

The basis for the administration of justice is extensive and
628 energetic self-help. Any injustice inflicted is avenged by the injured party or his kinsmen with a beating or murder.

As an example of the kind of self-help and the complications resulting from it, I shall cite the following authenticated case. An old Auin from Olifantskluft was visiting his brother-in-law in Sidonitzaub. The host set a snare and caught a giant bustard which the guest found, took out of the snare, and began to consume. His host arrived on the scene and stabbed his brother-in-law in the stomach with his throwing spear. The murderer fled, but he was apprehended and shot by relatives of

/155 cont./

628 the slain man. Now, naturally, a blood feud exists between the settlements, which, incidentally, are related to each other directly and by marriage.

Furthermore, it is interesting that the Auin from
648 Sidonitzaub sent a messenger to me in Rietfontein, where I was
[123] station commander, and had him inquire whether I had any objection to their making "orlog" [Tr., probably from the Dutch word oorlog, "war"]. I conveyed to them that the affair was none of my business since the war would take place in British territory. Unfortunately I was transferred from Rietfontein shortly afterward and was therefore unable to witness the campaign as a "military correspondent." According to reliable reports, the war has been settled and three men were killed.

This inquiry addressed to me makes it clear that under the pressure of present conditions the "unfortunate child of the moment" does not always surrender immediately to the impulses of the moment.

It is scarcely possible to give even a rough picture of the
674 legal notions of the Auin.

There is no doubt that the Bushman possesses a very definite sense of justice, but I do not feel capable of comparing it intelligibly to our own conceptions of justice.

It is a little easier to indicate what the Bushman (Auin) regards as absolute injustice, such as murder, theft, adultery, violation of the family territory, and stealing water (the latter only if little water is available). At any rate, with extended investigation, the catalogue could be considerably enlarged.

Personal property includes the hut (though this is not an ob-
422 ject of value), weapons, clothing, utilitarian objects, hides, and ornaments.

It is true that the gathered veld crop, game that has been killed, and water that has been collected are also personal /156/ property, but these are subject to extensive communal use which becomes more limited only in case of famine or a water shortage.

The land of the horde is communal property, as are the
423 game, veld crop, wood, and water on the land, the latter with limitations.

When a Bushman has burned off a piece of land in order to

/156 cont./

423 foster the growth of the veld crop, he alone may lay claim to the yield of the burned veld. Others, even members of the same settlement, are not allowed to use it.

The territorial property of the individual hordes is precisely delimited, and the boundaries are known to everyone. Boundary markers naturally do not exist, but with his marvelous sense of place, the Bushman knows exactly, to the last bush, the extent of his territory.

565 Social distinctions do not exist, just as there are no servants or domestics.

576 They greet each other by extending hands in a manner that differs from our practice (see Photo. 43).

567 Slavery is unknown. Men who have been, captured in war
727 are killed; captured women are taken into the victorious group and accorded completely equal rights.

R. Marriage, Position of the Woman, Children

582 Men marry between the ages of about 16 and 18 years, girls between 13 and 16. Both sets of figures naturally are estimates.

584 The candidate for marriage addresses his suit to the girl's mother. If the latter is no longer alive, the nearest relatives (father, uncle, aunt) take her place. The father is consulted only secondarily. The suitor brings his future in-laws presents in the form of game and veld food, sometimes over a period of more than a year.

If the affair proceeds smoothly, the man takes the girl to his hut after a time and the marriage is regarded as consummated.

If, in spite of the consent of her parents, the girl refuses to marry the man (she is entitled to express her wishes and by no means always follows her parents' desires), the young man will finally take the girl to his hut by force and have coitus with her. If she runs away, he brings her back. In this manner, her resistance seems to be gradually overcome.

684 If a man were to violate a girl without the consent of her parents, he would be killed.

585 No special ceremonies are observed to conclude the marriage. The marriage is considered consummated by coitus.

/156 cont./

584 The betrothal, which takes place immediately before the couple move into the man's pontok, is regarded as concluded when the man seizes the girl's wrist, as can be seen in Photograph 44. Since, however, "betrothal" and "marriage" are separated only by the walk to the hut, the seizing of the bride's forearm may be regarded as concluding the marriage.

The seizing of the forearm is a fairly violent gesture, and on the way to the hut the bride allows herself in a certain sense to be dragged along. Could it be that this perhaps represents a vestige of an earlier custom of abducting the woman?

606 It is curious how the relationship of the son-in-law to his mother-in-law changes after the marriage. The former avoids the company of his mother-in-law and does not sit down with her. If, for instance, he approaches the campfire with the obvious intention of sitting down in front of it, the mother-in-law will go away. If he is absolutely forced to discuss something with her, they yell at each other from a great distance.

836 Premarital sexual intercourse scarcely seems to occur.

163 I noted that most women had two or three children who were about two to three years apart (see p. 5).

591 The woman goes to the family or settlement of her husband, not the other way around. The fact that the young couple stays for some time in the settlement of the wife's parents, roughly until the first child is born, may have given rise to error. Later on, the couple always returns to the man's horde.

582 A man may not marry his own sister and likewise, naturally, neither his mother nor daughter. Other degrees of relationship constitute no absolute obstacle to marriage.

As a rule, however, one does not marry within his own family and, if possible, not even within his own horde. Preferably women are brought in from far away, often from groups speaking another language (Naroon, Genkuin, Hei-um [Heikum]).

851 The birth of a child does not necessitate a temporary separation of the marriage partners.

684 837 Marital fidelity seems to be observed to a fair extent. The adulterer is killed, and the wife is treated according to the temperament of the deceived husband, that is, she is given a more or less violent beating.

/156 cont./

684 Supposedly women are not killed for adultery.

/157/ Divorce rarely occurs, and then only when the woman
586 has become too old. The man then simply sends her away.

In most cases, however, the woman remains with her hus-
[595] band even in old age, while he provides himself with one or two younger and stronger women.

The children of the divorced or deceased woman stay with their father and are raised by the new wife.

587 Widows are permitted to marry again after a certain time, as is also the case for divorced women.

589 There is no special dress for widows.

The widows live in a special hut with the young girls.

The woman definitely occupies a position fairly equal to
562 that of the man. Also she quite frequently and energetically hen-
264 pecks him. Meals are consumed by the whole family together.

Concerning the division of labor, see page 29.

[184] The Rietfontein Auin always have just one wife. The reason
595 for this is said to be that "little food" is available. The Auin from Gam, on the average, have two, sometimes five wives.

Every wife has her own household.

The first wife seems to occupy a preferential position. It may be, however, that this is only because she is older.

As improbable as it may sound after what I have hitherto de-
548 scribed, there are supposed to be prostitutes among the married
684 women, who are willing to oblige for presents. When the husband finds out about it, he chases the woman away. It is not quite clear to me how this fits in with blood vengeance which is practiced in other cases. The Auin declared to me, "If a woman has affairs with many men, the man cannot after all wage 'orlog' with all these men."

Such a situation seems to be judged differently than one when a woman commits adultery in a special case.

842 Means for preventing conception are unknown.

Artificial abortion is sometimes supposed to be induced by
847 stepping on the abdomen of the pregnant woman.

Concerning infanticide, see page 5.

843 Sexual intercourse is not suspended until pregnancy has reached an advanced stage.

/157 cont./

The water and food collected by menstruating women are
841 consumed only by the women themselves and old people; the younger ones "it makes weak."

593 The authority of the parents practically ceases as soon as
858 the children are in a position to provide food for themselves.

A child is named soon after birth by the grandfather or grand-
553 mother (whether on the paternal or the maternal side was not determined).

Boys reach puberty between 14 and 16 years of age and girls
145 between 13 and 15 years of age (estimates).

The declaration of a boy's maturity is a special event in the
881 life of the Bushman. Under the leadership of the "doctor," several youths from neighboring settlements march into the bush and live together there for some weeks on the veld crop. During this time they receive some sort of instruction in secret affairs. Young and old Auin alike, whom I interrogated separately, denied that this instruction pertains to sexual matters. To the question of what they did during their stay in the bush, I always received the answer: "They dance." They did, indeed, describe for me a kind of dance which decidedly has something childishly mysteri-
[535] ous about it. A boy seats himself "piggyback" on the back of another, and both wrap themselves in a large hide mantle. The dance consists of the carrier tramping with his feet as rapidly as possible without moving forward, while both of them utter a low "hu, hu" in as horrifying a manner as possible.

It is indeed difficult to imagine that this interesting occupation should last for weeks, interrupted only by sleeping and eating.

In addition, the young people seem to be treated quite badly in the course of this preparation and to receive little to eat; all of them concurred in the opinion that it is "miserable."

I learned through hints that the candidates for manhood play all kinds of tricks on neighboring villages during the night and play as "ghosts" a bit, as well as stealing food.

The actual attainment of manhood, after which the boys are
[884] warriors and are allowed to marry, is not solely dependent on attending the preparation, but also on the killing of the first piece of big game.

Tattooing is not connected with the official attainment of
[304] manhood

/157 cont./

881 manhood. In the case of girls no special preparation occurs. As soon as a girl has her first menstrual period, people from neighboring and friendly settlements assemble for a great celebration. The girl lies prone on the ground while old women form the orchestra near, singing and clapping their hands. The younger [535] women stamp /158/ along in goose step, their buttocks exposed. Individual men from time to time enter the circle and all of them imitate the movements and sounds of rutting animals. I believe that this is the eland bull dance. A girl may marry [582] only after the onset of the first menses.

S. Birth and Death

The birth takes place in the open air outside the settlement. 844 The woman sits on the ground with the upper part of her body propped up and her knees drawn up.

[845] Reviving apparently stillborn children by rubbing their limbs and bodies is practiced.

Old women assist at the birth. In difficult cases, for instance, when the woman is ill at the time of the birth, the "doctor" is called in.

The doctor, among other means that he employs, is supposed to relieve a difficult birth by performing a kind of sucking with his mouth at the vagina.

When he assists at a birth, the doctor murmurs magical formulas.

The umbilical cord is severed with the sharp edge of a reed splinter, never with any other object. Practical reasons for this could not be given: "It has always been so."

The man slings his bowstring around the body of the woman in labor. Then he goes away and during the birth stays in his hut.

I was unable to determine any symbolic significance in the use of the bowstring. The explanation was: "The birth is easier."

[846] The woman who has given birth is spared as long as a month after delivery and does not need to work.

The newborn child is wiped off with the nest of the weaver bird (?). In no case is water used.

/158 cont./

845 847 If twins are born, which apparently is very rare, one child is killed. When the twins are a boy and a girl, curiously enough it is the boy who is killed. The killing is done by the midwife or mother by burial immediately after birth.

852 A birth is celebrated by dancing, but only if enough food is on hand.

853 Nursing continues for two to three years.

A distinction is made between people who have died "well," 764 that is, easily and without a painful illness, and those who die [766] in great pain.

The former are buried in the bush near the surface in the vicinity of the settlement, and the settlement is moved.

766 The latter, whom the Bushman probably regards as possessed and fears even after death, are not buried at all since they are abandoned even before death, and the entire settlement flees.

In the case of a burial, it takes place immediately after 764 death.

The corpse is tied up in a crouched position, with the hands placed crosswise on the shoulders; the clothing is not removed.

The grave is not oriented with regard to any special direction; it is made as shallow and small as possible and is not provided with protective measures against predators.

The bow and the quiver with its contents are supposed to be hung on a stick planted into the ground over the head of the corpse. I present this with reservations, since I have never seen a grave marker of this kind.

People who have had a "good" death have died naturally; 761 the others were bewitched. I use this expression, since it seems to me to come closest to the conception of the Auin.

If an Auin has murdered another Bushman, he drags him 766 under a rosinkis bush and places him face downward on the ground.

The women of the settlement participate in the widow's 765 lament, which consists of howling and screaming. External signs of mourning are not worn.

/158 cont./

T. Religion, Cult, Mythology

756 The Bushman doctor conjures up rain by scattering on the
[789] ground a kind of red earth which he fetches from afar and carries about with him.

I regard the doctors, who take the place of sorcerers, as quite experienced people who have a considerable gift for observation. At the same time, they throw plenty of sand in their
[775] clients' eyes. The soul of the deceased does not die. The Bush-
[769] men have great fear of the dead and even of the place of death.

Illnesses that give rise to much pain and complaining on the
753 part of the sufferers are regarded as having been caused by a higher power (demons); others are regarded as natural illness.

The doctor practices exorcism by saying magical charms over
755 the sick person and finally, with the motion of a juggler, flinging to the ground a little piece of wood or the like which is supposed to have come from the body of the patient and to have caused the illness.

The only thing that I was able to establish concerning their
776 religious notions, despite weeks of fruitless endeavor, /159/ is that a higher power exists which may be harmful to men and may cause them to perish from serious illnesses. This higher power, which is feared, dwells "above." I could not get them to do more than point upward in the direction of the sky, except for the statement that the feared power is far beyond the treetops. [Fig. 14 appears here.]

The doctor is both physician and sorcerer. He is probably
756 also a priest, for whenever I asked questions concerning religion and the like, I was always referred to the doctor, who supposedly was informed about these matters.

Not every settlement has a doctor. Between Oas, Rietfontein, and Ganab (100 kilometers north of Rietfontein) there was supposedly only one.

The doctor has his head shaved smooth. In addition, he is said to wear ornaments that no other man may use.

Boys who have been apprenticed to a doctor for many years may later, when they have become older, replace their master.

In the treatment of the sick, charlatanism seems to be mixed

[Text continues on page 56]

/159 cont./

787 Fig. 14. Prophecy Wood. One-half natural size
[as shown in the original text].

a, b, c, d, bits of wood of a set; d^1, side view of d; e e, holes for a string.

The prophecy wood consists of a set of four variously shaped bits of wood. These are thrown like our dice and the future can be predicted from their position, for example, whether hunting will be successful, or whether there will be a war.

An Auin maintained that from the prophecy wood he saw "an ox-wagon with two Whites approaching the settlement."
[791] The wood appears to belong to a dwindling group of persons who, like the "doctors," are cleverer than most people.

/159 cont./

756 with a considerable portion of actual experience and knowledge.

The doctors are paid for their efforts.

There are also female doctors.

[648] I have observed no sign of hostility toward Whites among these people. They know how to evade observation, however, even better than the ordinary Bushman, and that says a good deal.

Only the doctor may eat a certain kind of poisonous snake, apparently the so-called black mamba, which I regard as an older type of cobra.

U. Totemism

771 I was unable to observe any indications that might lead one to deduce the existence of totemism.

V. Medicine

755 A man who was suffering from headache had colored his forehead with a black grease that supposedly had curative powers and had wound a thin thong firmly around his head. Our household remedy of firmly squeezing the sides of the aching head with both hands was familiar to the Auin.

278 752 The Bushman doctor makes an antidote from the black mamba, which he alone may eat. This antidote is supposed to help against the bites of all snakes, except that of the mamba itself.

He dries and pulverizes the lungs, gall, and liver, as well as the poisonous fangs with the poison glands. This powder is stirred into a paste with the fat of the same snake, and the paste, so I was informed, is rubbed into the enlarged wound, which has first been sucked out.

At the same time, various deep incisions are made on the upper arm and chest, from which considerable blood flows.

278 Poisons that work internally are not manufactured. The Auin maintain, however, that the arrow poison also works internally.

The manufacture of arrow poison was described above.

/159 cont./

278 752 [411] Poisoned arrows shot into the chest and abdomen are described as unconditionally deadly. Arrow wounds on extremities, as well as very superficial ones, are supposed to be curable under certain circumstances if immediate help is provided.

[751] There is no inoculation against arrow poison.

[827] An older Auin suffering from badly inflamed eyes attributed this illness to an arrow wound he had received many years earlier. His statement, of course, cannot be verified.

165 Malaria is endemic and annually exacts many lives. The number of cases resulting in death was especially great in 1908-1909. Whole settlements are supposed to have died out. Epidemics were unknown even to the "oldest people."

Venereal diseases are blessings of civilization, but evidently not yet widespread.

731 Famine actually prevails every year toward the end of the dry season, especially if the preceding rainy season has been poor. During this time, almost all the Auin are emaciated to skeletons. Death by hunger is not supposed to /160/ occur. After all, the Bushman always finds something to eat, even if it is only grass seeds.

756 The so-called doctors decidedly possess great experience in medical matters, which, however, does not prevent them from practicing considerable charlatanism (see Section T).

W. Time Reckoning, Astonomy

805 The day is divided according to the position of the sun. Certain time segments are indicated with great exactitude according to the position of the sun. If one asks a Bushman, "How far is it to the watering place?" he will point to the place in the sky that the sun will have reached by the time one gets there.

The concept of the month is known (gnui, "month").

The relation of the solar year to lunar months is unknown.

The Auin divides up the year, for which, incidentally, he has no definite, but rather only a very vague concept, as follows:

/160 cont./

805 cold dry season,
warm dry season,
short rainy season,
rainy season.

Just as these various seasons of the year tend to be very irregular in the Kalahari, the Auin's division of the year also is quite variable.

821 There is only one designation, a collective name, for the starry sky.

173 I have not been able to detect any traces of a "history."

Only events going back at most two generations are transmitted as an oral tradition.

172 The Auin know nothing about the Bushman drawings.

At the watering place Kazupitzaub between Oas and Olifantskluft, in other words, in the Auin region, there are supposedly Bushman drawings on rock walls. The Auin call these drawings the "work of Satan." I should observe that this expression was given me by an interpreter who was unable to supply me with a better translation of the Bushman concept. In case I should once again go to this region, I shall report on this matter.

173 In their own opinion, the Auin have been living in the region they now occupy "as long as there have been human beings."

X. Counting and Calculating

802 Fingers and toes are used for counting.

Five is expressed by the word for hand, ten by two hands, 15 by two hands and one foot, 20 by two hands and two feet.

Among about 20 Rietfontein Auin, there was only one who could count beyond 20. I cannot say, however, whether this man may not have hit upon the idea through my suggestion. He counted up to 40.

/160 cont./

Conclusion

000 Should anyone intend to study the Auin more closely, he is urged to do so very soon.

In the near future the Auin will pay tribute to advancing civilization by surrendering their distinctive characteristics, or, what is even more probable according to what happened during the last occurrence of malaria, they will die out.

Nachstehende Arbeit ist auf Befehl des Kommandos des Nordbezirks der Schutztruppe infolge einer Anregung des Museums für Völkerkunde in Berlin entstanden.

Nachdem ich mich während der Monate August, September und Oktober 1908 mit den notwendigen Beobachtungen eingehend beschäftigt hatte, wurde ich von Rietfontein (Nord) und damit aus dem Gebiet der ǂAuin abberufen. Auf diese Unterbrechung der kaum begonnenen Studien ist die Unvollständigkeit und Lückenhaftigkeit der Angaben zurückzuführen, die sich besonders in den letzten Kapiteln bemerkbar machen. So bin ich zu dem wichtigen Abschnitt über Linguistik überhaupt nicht gekommen, ebensowenig wie zur Anlage einer Sammlung von Ethnologica.

Die vorgenommenen Beobachtungen und Erkundigungen wurden nach besten Kräften mehrfach auf ihre Richtigkeit geprüft. Die Möglichkeit von Irrtümern wird natürlich trotzdem rückhaltlos zugegeben.

Aminuis, im August 1908. Kaufmann.

* * *

Allgemeines.

Nach meiner Überzeugung handelt es sich bei den ǂAuin wie bei allen andern Kalahari-Buschmännern nicht um eine einheitliche Rasse, sondern um ein Volk oder besser mehrere Völker, welche durch Vermischung untereinander und vor allem mit Völkern anderer Rassen (Bantu) den eigentlichen Typ verloren haben. Jedenfalls macht eine Anzahl Bergdamara oder Herero entschieden mehr den Eindruck, aus einem Guß zu stammen, als die gleiche Zahl Buschleute.

Die Verschiedenheit der Sprachen der einzelnen Stämme ist manchmal so groß, daß eine Verständigung ausgeschlossen ist.

Die anscheinende Einheitlichkeit in der Kultur ist wohl durch die Gleichartigkeit der sie allerseits umgebenden Landschaft und die Lebensverhältnisse begründet (Kalaharikultur).

Eine innige Verwandtschaft irgendwelcher Art zwischen Hottentotten und Buschleuten besteht zweifellos, sei es nun, daß die Buschleute degenerierte Hottentotten mit mehr oder weniger Einschlag fremden Blutes, oder umgekehrt, daß die Hottentotten von der Kalaharikultur emanzipierte Buschleute mit fremder Beimischung sind.

Ich glaube, keine Indiskretion zu begehen, wenn ich mitteile, daß der Ethnograph Dr. Pöch diese Ansicht mit mir teilt. In einem Privatbrief schreibt er mir aus Kamelpan (Ngamiland): „Kurz möchte ich noch bemerken, daß die Kalahari-Buschmänner in bezug auf ihre Sprache von mir auch eine ebenso schlechte Note erhalten wie auf ihr Aussehen: ich konnte eine kolossal nahe Verwandtschaft mit dem Nama feststellen, aber einen alten, heute nicht mehr gesprochenen Dialekt."

Da mir zu anthropologischen Messungen usw. die Vorkenntnisse fehlen, beschränke ich mich dar-

[p. 135]

auf, einige von mir aufgenommene ǂAuintypen zu bringen. Vielleicht sind sie als Vergleichsobjekte nicht ohne Wert.

Zufügen möchte ich noch, daß ich bei Messung der Körpergröße folgendes Resultat erhalten habe:

Erwachsene Männer (zwischen 20 und 40 Jahren)	
Durchschnitt	1.51 1/2 m
Größtes Maß	1.62 „
Kleinstes „	1.47 „
Erwachsene Frauen (zwischen 20 und 40 Jahren)	
Durchschnitt	1.45 1/2 m
Größtes Maß	1.53 „
Kleinstes „	1.38 „

A. Geographie und Statistik.

1-7.*) Die ǂAuin, wie sie sich selbst nennen und auch von den benachbarten Buschmannstämmen genannt werden, bewohnen jenen Teil der mittleren Kalahari, welcher etwa durch die Wasserstellen Rietfontein — Ganab — Gam — Sidonitzaub — Otjiamangombe — Tjumda — Epukiro — Oas — Stampriet — Rooigrauwater — Habakobis näher begrenzt wird. Ihr Gebiet befindet sich größtenteils innerhalb der Grenzen des deutschen Schutzgebietes. Nebenstehende Skizze gibt die geographische Lage nach Möglichkeit genau wieder, ebenso das ungefähre Gebiet der benachbarten Buschmannstämme. Die Hottentotten bezeichnen die ǂAuin als ǂAu-San (Schinz), die Bewohner des Chansefeldes als ǂAukwé (Passarge), die Betschuanen als Makaukau. Die ungefähre Anzahl der Auin,**) natürlich in Form allerrohester Schätzung, ergibt sich aus folgender Zusammenstellung:

Es wohnen in der Gegend von

Oas	etwa 300	Köpfe
Dawis	„ 150	„
Stampriet	„ 250	„
Rooigrauwater	„ 50	„
Korikas	„ 100	„
Olifantskloof	„ 200	„
Habakobis	„ 100	„
Rietfontein	„ 200	„
Tjumda	„ 100	„
Go	„ 150	„
Sidonitzaub	„ 1000	„
Kalkfontein	„ 100	„
Epukiro	„ 100	„
Ganab	„ 100	„
Gam	„ 100	„
zusammen	etwa 3000	Köpfe.

*) Die Ziffern sind Hinweise auf die „Anleitung" des Museums für Völkerkunde in Berlin.

**) Ich lasse der Einfachheit halber von nun an das Zeichen ǂ, welches den Schnalzlaut andeuten soll, fort.

Nach meiner Ansicht ist die Anzahl der in der Kalahari lebenden Buschleute (nicht nur die der Auin) stets unterschätzt worden.

Diese Zeilen schrieb ich im Oktober 1908. Heute, also noch nicht ein Jahr später, muß ich meine Ansicht ändern, da die Malaria der letzten Regenzeit ungeheure Opfer gefordert und die Auin ebenso wie die anderen Stämme dezimiert hat. Nach mitgeteilten Angaben halte ich mich für berechtigt, anzudeuten, daß von den oben auf 3000 geschätzten Auin höchstens noch etwa die Hälfte vorhanden ist.

Die Aufstellung einer genaueren Statistik ist nicht möglich, da sich die Buschleute mit Erfolg jeder Kontrolle zu entziehen wissen. Diesem trägt auch die Verwaltung des Schutzgebiets Rechnung, indem sie von vornherein auf jede Registrierung usw. der Kalahari-Buschleute verzichtet.

Besondere Bevölkerungsschichten innerhalb der 28.
Auin sind nicht zu unterscheiden, es sei denn,
daß man bei einzelnen Individuen zweifellos mehr 29.
als bei andern einen Einschlag von Negerblut
feststellen kann.

Besonders der Stamm bei Gam besteht fast 31.
durchweg aus verhältnismäßig großen Leuten, welche auch nach gründlicher Wäsche entschieden eine etwas dunklere Färbung aufweisen als die andern Auin.

Nach meiner Beobachtung kommen auf einen Mann etwa eine bis zwei Frauen und auf jede Frau zwei bis drei Kinder.

Hierbei möchte ich erwähnen, daß neugeborene Kinder stets getötet werden, wenn die Mutter noch ein Kind stillt, was etwa bis zum dritten Lebensjahre dauert. Die Tötung erfolgt gleich nach der Geburt durch die Mutter, welche das Neugeborene lebendig begräbt. Der Vater hat keinen Einfluß hierauf. Da der eheliche Verkehr während der Dauer des Stillens nicht unterbrochen wird, die Stillungsperiode aber etwa drei Jahre dauert, so folgt hieraus, daß etwa jedes dritte Kind aufgezogen wird, während die in der Zwischenzeit geborenen ohne Ausnahme getötet werden. Es dürfte dies wohl ein Hauptfaktor des zweifellosen Rückgangs der Bevölkerungsziffer sein.

Da jede Frau ihren besonderen Windschirm 10.
(Hütte) hat, der Mann aber abwechselnd bei seinen Frauen wohnt, und diese wieder ihre Kinder bei sich haben, so kommen auf jede Hütte etwa drei bis vier Personen.

Die Größe der Werften (Dörfer) ist ganz unbestimmt und je nach den Umständen veränderlich. Zur Trockenzeit bildet sich meist aus ein bis zwei Familien eine Niederlassung, während zur Zeit der reichlichen Feldkost, also gegen Ende und kurz nach

Karte des Omin-Gebiets.

1:9 250 000.

der Regenzeit, sich manchmal bis zu 30 Familien zu einem „Dorfe" zusammenschließen. Im April 1908 wohnten in einer Niederlassung bei Sidonitzaub etwa 400 Männer. Rechnet man ihren Anhang dazu, so kommen mindestens 1000 Personen zusammen.

14. Sämtliche Männer sind bewaffnet und Krieger.

22. Wie schon bemerkt, läßt sich eine deutliche Abnahme der Bevölkerung feststellen, welche man nach dem Riesentempo, in dem sie fortschreitet, als ein rapides Aussterben bezeichnen kann. Abgesehen von Kindesmord und Malaria kann man den Rückgang des Wildstandes als Grund der Bevölkerungsabnahme bezeichnen, da hierdurch die Ernährung erschwert wird. Ältere Auin geben an, daß in früheren Zeiten die Löwenplage große Opfer gefordert hat.

Die Kriege sind anscheinend seit der Berührung mit den Weißen sehr zurückgegangen, aber auch heute noch fordern sie entschieden zahlreiche Opfer.

26. Der Auin steht auf der niedrigsten Stufe der menschlichen Entwicklungsleiter: er ist lediglich
31. Sammler und Jäger.

29. Diese Lebensweise wird ihm von dem Charakter seines Landes vorgeschrieben. Dieser Teil der Kalahari, wo die Wasserstellen manchmal 100 km auseinanderliegen und in ihrer Zahl sehr beschränkt sind, lassen den Viehzüchter nicht entstehen, zumal auch die für Vieh genießbaren Tschamas verhältnismäßig wenig vertreten sind.

Im Auin-Gebiet überwiegt die Ebene im Landschaftsbilde, nur an den Rivierrändern tritt stellenweise das Urgestein zutage. Sogenannte Dünen verleihen dem Gelände vorzugsweise in der Nähe der Riviere (trockene, nur nach heftigen Regen wasserführende Flußbetten) einen leichthügeligen Charakter. Die Bodenbedeckung wechselt zwischen Gras-, Busch- und Baumsteppe und dichtem Buschwald. Die Menge der Niederschläge ist sehr gering; aus Mangel an genügendem statistischen Material ist eine genauere Angabe nicht möglich.

B. Wohnstätten und Einrichtung.

1. Die typische Form des Wohnhauses ist der Windschirm, also die primitivste Form der menschlichen Wohnung, welche die Bezeichnung Hütte kaum verdient. Ihr Bau ist in einigen Minuten vollendet. Einige Zweige werden mit dem dickeren Ende locker im Halbkreise in die Erde gesteckt und mit den Verästelungen gegeneinander gelehnt. Eine feste Verbindung der Streben untereinander habe ich nie gesehen, obwohl ich einige hundert Hütten daraufhin untersucht habe. Das Ganze wird mit Gras beworfen, und der Bau ist fertig. In der Trockenzeit werden die Bauten meist noch viel flüchtiger ausgeführt und bestehen manchmal nur aus einigen Grasbüscheln, welche zwischen die Zweige eines lebenden Busches lose hingeworfen sind. Der ganze Bau hat oft kaum die Höhe von 1 m und keine Bedachung. Es ist dieses dann ein wirklicher Windschirm, welcher seine Bewohner im Liegen vor Zugluft schützen soll.

Halt sich die Werft nur einige Tage an der betreffenden Stelle auf, so genügt der Schatten von einigen Büschen, und auf Bauten wird überhaupt verzichtet.

Häuser auf Bäumen sind unbekannt; sie würden auch nur im Kaukaufeld (Baobab) in Betracht kommen, da im eigentlichen Auin-Gebiet die Bäume zu schwach dazu sind.

Jede Frau hat ihren eigenen Windschirm. In 7.
Ermangelung dessen wohnt sie unter einem besonderen Busch.

Junge Mädchen und junge unverheiratete 8.
Männer bewohnen manchmal, nach Geschlechtern getrennt, besondere „Mädchen"- bzw. „Junggesellenhäuser".

Irgendwelche besondere Bauten, wie Versamm- 9 22.
lungshäuser, Vorratsräume usw. sind unbekannt.

Die Reinlichkeit in der Nähe der Hütten ist 23.
ziemlich gering. Besondere Abtritte sind nicht vorhanden. Die Entleerung geschieht lediglich mit Rücksicht auf Deckung gegen Sicht. Unter der Hauptwindrichtung findet man größere Fäkalienansammlungen. Das von den Hereros häufig geübte Eingraben der Exkremente geschieht anscheinend nicht.

Der Pontok (Windschirm) ist durchaus kein 26.
Wertobjekt. Nach dem Tode des Besitzers verläßt die ganze Horde den Ort. Daher ist die Frage der Erbschaft der Hütte gegenstandslos.

Ein Türverschluß ist nicht vorhanden, auch 31.
bei der Struktur der Hütte kaum anzubringen. Hierbei ist zu erwähnen, daß in den Werften, auch während alle Leute abwesend sind, die Sachen ohne Aufsicht herumliegen. Ein Diebstahl würde unter allen Umständen mit dem Tode des Diebes gesühnt werden. Da der Buschmann die Fußspur jedes Menschen der Gegend kennt, so würde der Täter stets zu ermitteln sein. Der Buschmann arbeitet in dieser Hinsicht so zuverlässig wie der beste Polizeihund.

Als Lagerstatt dient Gras, welches mit einigen gegerbten Fellen bedeckt ist. Andere Gegenstände zur Wohnungseinrichtung sind nicht vorhanden.

C. Ernährung.

1. 2. 3. Das „Doro" (Feuerzeug) (Fig. 1) besteht aus zwei runden Stäben der Burkea Africana. Von diesen ist das eine mit einigen runden, flachen Aushöhlungen versehen, in welche das abgerundete Ende des anderen Stockes hineinpaßt.

Fig. 1. Doro (Feuerholz).
A Stock, welcher gequirlt wird.
a a langer Teil.
b abgerundetes Ende, welches in die Bohrlöcher eingesetzt wird.

a Stäbchen.
b Baumharz.

Fig. 3. Stäbchen mit Pfeilgift.
a Stäbchen.
b Giftspindel, welche umwickelt ist.

1/2 natürlicher Größe.

Der erstere Stock wird auf den Boden gelegt und mit beiden Füßen festgehalten. Der andere wird mit dem runden Ende in eine der Aushöhlung gesetzt und in dieser zwischen den flachen Händen so rasch wie möglich gequirlt. Wie man auf dem Bilde (Bild 19) sieht, gleiten die Hände hierbei nach unten, und oft greift ein zweiter Mann sofort oben wieder zu, wenn der erste mit den Händen unten angekommen ist. Um das Bohrloch herum wird eine Art Zunder von gut getrockneten Vogelnestern (Webervogel?) gelegt. Das feine Bohrmehl fängt nach einigen Minuten an zu schwälen, und durch Blasen mit dem Munde facht man den Zunder zur Flamme an.

Der „Kapitän" (Aichab) der Werft achtet darauf, daß das Feuer nicht ausgeht. Ein „heiliges" 4.
Feuer ist nicht vorhanden. Die Bewahrung des Feuers vor dem Verlöschen geschieht lediglich aus praktischen Gründen, da das Feuerquirlen immerhin ziemlich anstrengend ist.

Die Stelle des Herdes vertreten einige Steine, 5.
die übrigens nicht überall in der Kalahari vorhanden sind. Bei Regenwetter wird im Windschirm gekocht.

Die Frau kocht, während die Kinder ihr 6.
helfen. In Ausnahmefällen kann man auch den pater familias am Kochfeuer tätig sehen.

Wasser und Holz wird gelegentlich von 7.
sämtlichen Familienmitgliedern herbeigeschafft. Der Hausbau ist lediglich Arbeit der Frau. Junggesellenhütten werden ebenfalls von Frauen der Horde ausgeführt.

Hölzerne Kochtöpfe sind vorhanden. An- 8.
geblich kommen sie durch Tauschhandel aus dem Ambolande.

Primitive Löffel stellt der Auin aus Holz selbst 11.
her oder erwirbt sie durch Tausch aus der Gegend des Ngami. Besondere Schnitzkünstler befinden sich öfter unter älteren Männern. Als Löffel dient oft der obere gewölbte Teil einer kleinen Schildkrötenschale, deren untere flache Seite abgeschnitten ist.

Diese finden auch als Trinkgefäße Verwen- 12.
dung und sind neben ausgehöhlten Tschamas das einzige von mir vorgefundene Trinkgefäß.

Mörser aus Holz mit Steinboden. Die Her- 13.
stellung ist äußerst mühsam. Ein Holzklotz wird in die Erde gegraben, festgestampft und mit der eisernen Lanzenspitze oder einem Messer ausgehöhlt. Das Eisen wird hierzu manchmal heiß gemacht. Feuer wird nicht verwendet. Der Stampfer aus Holz wird unten mit einem Stein versehen. Der Stein am Boden des Mörsers ist mit Baumharz festgekittet.

Brennende Äste werden nach Art einer Fackel 17.
verwendet, aber nur für kurze Zeit in der Nähe des Feuers.

Die Form des Mörsers und der Keule gibt 18.
Bild 18. Der Mörser wird aus weichem Holz mit der Lanzenspitze ausgebohrt. Feuer zum Aushöhlen wird nicht verwendet (s. oben).

Hausgerät. Zwei flache Steine zum Zer- 27.
klopfen von harten Feldfrüchten. Löffel roh aus Holz geschnitzt. Hölzerner Topf, leere Straußeneier

mit rundem Loch als Wasserbehälter. Oft ist eine Verzierung angebracht. Grabstock an einem Ende gespitzt.

48. Verzierungen. Leider bin ich nicht dazu gekommen, genauere Feststellungen über Verzierungen zu machen. Solche werden aber an vielen Gegenständen, wie Straußeneiern, Pfeifenstopfern (welche an Schnur um den Hals getragen werden), angebracht.

19. Im allgemeinen nimmt der Auin drei Mahlzeiten täglich zu sich (morgens, mittags und abends). Hat er aber genügende Kost, so ißt er den ganzen Tag mit den notwendigen Zwischenpausen, und wenn es nicht zu kalt ist, auch während der Nacht.

20. Ein besonderes Menu ist nicht erkennbar. Es wird gegessen, was gerade vorhanden ist.

21. Die Hyäne wird nicht verzehrt, weil sie „Leichen frißt". Der Leopard soll nicht von allen Leuten gegessen werden. Die Gründe hierfür sind mir nicht bekannt. Der Schabrackenschakal wird häufig verschmäht, weil er „ein Hund ist". Der Silberschakal dagegen wird gern gegessen, weil er „keinen Unrat frißt".

Junge Mädchen, die noch nicht die Regel gehabt haben, und nicht erwachsene Knaben dürfen kein Wildfleisch essen, weil sie dann „mager bleiben".

22. Spuren von Anthropophagie habe ich nie beobachten können. Auch von alten erfahrenen Eingeborenen anderer Rassen (Klippkaffern) wurde mir mitgeteilt, sie hätten nie davon gehört, daß Buschleute Menschenfleisch gegessen hatten.

Ich sprach mit einigen alten Auin hierüber, und diese waren durchaus nicht entrüstet bei dem Gedanken. Ihre Begründung war etwa folgende: „Unsere Eltern haben uns nie gesagt, daß man Menschenfleisch essen soll. Würden andre alte Leute es genießen, dann könnten wir es auch tun".

Bei der niedrigen Kulturstufe der Buschleute ist das Fehlen der Anthropophagie meiner Ansicht nach direkt auffallend.

D. Schmuck und Haartracht.

1. Es wurden folgende Schmuckgegenstände beobachtet.

Bei Männern:

Halsring, — dünner Holzring aus sogenanntem Rosinkisbusch, kreisförmig zusammengebunden — mit eingekratzten Strichen verziert. Armringe. 3 bis 20 einfache Schnurringe. Manchmal sind einzelne Eisen- oder Glasperlen auf die Ringe aufgezogen (s. Bild 3 u. 4). Die Eisenperlen stammen wohl von östlichen Kaffernstämmen. Die Ringe werden aus dem Gespinst einer Baumspinne (Stegodyphus dumicola Pocock?) hergestellt. Eine Anzahl Fäden werden zu einem Klumpen zusammengeballt und dieser auf dem Oberschenkel mit der flachen Hand zu Schnüren etwa von der Dicke einer Stricknadel „genudelt". Die Schnüre werden dann zu zweien zusammengedreht und der Ring wird durch „Zusammennudeln" geschlossen.

Ringe um Handgelenke. Dieselben Ringe wie die um den Oberarm getragenen. Außerdem 3 bis 5 mm breite einfache Ringe aus Wildleder sowie einzelne Ringe aus Eisen- und Kupferdraht. Letztere sind angeblich von Batauana eingetauscht.

Unterschenkel. Manche Männer und Frauen tragen 1 bis 2 Lederringe direkt unter dem Knie an einem oder beiden Beinen. Dieselben sind etwas breiter als die Lederringe um die Handgelenke (s. Bild 12 und 14).

Bei Frauen:

Kopfschmuck. Verschiedene Zusammenstellungen von Ketten aus Straußeneierschalen, wie sie Bild 20 zeigt. Manchmal findet sich auch nur ein Stückchen einer solchen Molentzakette in die Stirnhaare eingeflochten (s. Bild 36: tanzendes Weib links). Auch bei einem Mann habe ich diesen Schmuck gefunden.

Ohrringe von Molentzakette, Halsketten von Glasperlen. Arm-, Handgelenk- und Beinringe wie bei Männern.

Der „Buschmanndoktor" trägt besonderen 2.
Schmuck, den andere Leute nicht tragen dürfen. Ich bin eines solchen leider nicht habhaft geworden.

Mädchen tragen Schmuck angeblich erst nach 3.
Eintritt der ersten Regel.

Zu Tänzen und Feierlichkeiten wird aller 4.
Schmuck angelegt. Der Kopfschmuck der Frauen auf Bild 20 wird nur zu besonders feierlichen Gelegenheiten angelegt.

Der „Doktor" trägt den Kopf kahl ge- 17.
schoren. Eine besondere Haartracht ist mir nicht aufgefallen. Die Männer stecken oft einzelne lose Straußenfedern in die Haare, während die Frauen gern Glas- oder Eisenperlen hineinflechten. Außerdem wird eine Art Pomade von den Frauen angewendet, die aus verschiedenen pulverisierten Pflanzenteilen besteht, welche mit dem Schalenfett von Antilopen gebunden werden.

Männer scheren das Haupthaar zuweilen mit 18.
einem Messer oder einer Glasscherbe.

Ein Unterschied in der Haartracht zwischen 21.
Mädchen und verheirateten Frauen besteht nicht.

Die Haare werden häufig durch ein Gemisch 23.
von Fett und einer roten Erde gefärbt. Es ist mir jedoch zweifelhaft, ob dies nicht ein Mittel ist, um die Haare stellenweise ausgehen zu lassen. Allerdings müßte dann wohl noch ein anderer Bestandteil

in diesem Gemisch vorhanden sein, den ich nicht feststellen konnte.

24. 25. Falls Bart vorhanden ist, was nicht oft vorkommt, so wird er weder beschnitten noch sonst entfernt.

26. Schamhaare sind spärlich vorhanden und werden manchmal rasiert (Glasscherbe). Weiber haben angeblich überhaupt keine Schambehaarung.

E. Künstliche Verunstaltungen.

1. Eine Art Schminke von rotbrauner Farbe wird von den Weibern angewendet.

2. Sie besteht aus einer Mischung von Fett und roter Erde (s. D. 23) und wird von den Weibern selbst hergestellt.

3. Die Schminke gilt lediglich als Schönheitsmittel und wird besonders zu Festen (Tänzen) an-
4. gewendet.

5. 6. 7. Männer und Jünglinge benutzen die Schminke nicht, auch nicht alte Frauen, sondern nur junge Weiber und Mädchen.

8. Die Mischung wird auf den Wangen kreisförmig aufgetragen (s. Bild 20: Frau am weitesten links), aber auch an allen möglichen anderen Stellen des Körpers, wie auf Armen oder Unterleib, eingerieben. Häufig wird der ganze Körper auf diese Weise eingefettet.

9. Bei Männern ist eine Art Schmiere von schwarzer Farbe im Gebrauch, welche „wohlriechend", wenigstens nach Buschmannbegriffen, ist. Diese wird vom „Doktor" hergestellt. Die Männer schmieren sie unter und auf die Nase. Es ist zweifelhaft, ob sie mehr Schönheits- oder Genußmittel ist.

14. Alle männlichen Auin haben über der Nasenwurzel einen grünen Strich, meist auch einen senkrecht dazu stehenden Querstrich darunter. Der Querstrich ist meist nicht gefärbt (vgl. Fig. 4).

Beide Striche bestehen aus unzähligen kleinen Querschnitten. In dem großen Querstrich sind fast immer 2 bis 4 tiefe, besonders sichtbare Narben zu bemerken. Die Länge des Längsstrichs beträgt meistens 2,5 bis 3,5 cm, die des Querstrichs 1 bis 1,5 cm. Manchmal ist der Längsstrich bedeutend länger und reicht bis an die Stirnhaare heran. Bei einem etwa zwanzig Jahre alten Auin fand sich keine Stirntatuierung vor. Er antwortete auf Befragen, daß „es später noch gemacht würde". Anderseits fand ich bei einem höchstens acht Jahre alten, gänzlich unentwickelten Mädchen bereits die Stirntatuierung vor. Sie scheint demnach keinen Zusammenhang mit der Geschlechtsreife zu haben, wie auch die Auin selbst bestätigen. Eine Frau hatte zwei parallel laufende Längsstriche, eine andere auf jeder Wange je zwei Striche von Größe und Ausführung des senkrechten Stirnstrichs. Sie waren beide geborene Auin, also nicht in den Stamm hineingeheiratet.

Die Stirntatuierung soll nach Angabe der Auin von Betschuanen abgesehen sein.

Die Stirntatuierung heißt Gi. Eine besondere 16.
Bedeutung wird ihr anscheinend nicht beigelegt. Übrigens habe ich bei allen anderen Buschmannstämmen dieselbe Tatuierung gesehen.

Fig. 4. Stirntatuierung. 1/3 nat. Größe.

a Längsstrich } Beide werden gebildet durch unzähliges kleine Schnitte,
b Querstrich } welche durch die Striche angedeutet sind.
c tiefere und längere Einschnitte im Querstrich.

Meist ist in die Tatuierung grüner Farbstoff eingerieben.

Als Werkzeug zum Einritzen der unzähligen 17.
kleinen Querschnitte, die die Stirnzeichnung ausmachen, dient irgendein geschärftes, beliebiges Stückchen Eisen. Durch welchen Farbstoff die grüne Farbe, die unverwüstlich ist, hervorgerufen wird, habe ich nicht feststellen können.

Die Tatuierung wird bei Knaben und Mädchen 18-24.
etwa im Alter von 12 bis 14 Jahren (aber auch früher und später) vorgenommen, und zwar vom „Doktor" bzw. von der „Doktorfrau". Be- 32.
sondere Zeremonien usw. werden nicht beobachtet, jedoch wird die Operation abseits der Werft im Busch vorgenommen. Es kommen möglichst viel junge Leute von mehreren Werften zum Tatuieren zusammen, jedenfalls aber nur aus praktischen Gründen. Es werden auch Feste bei dieser Gelegenheit gefeiert, d. h. es wird gegessen und getanzt. Aber diese Feste hängen mit der Tatuierung nur mittelbar zusammen. Sind nämlich mehrere

Buschleute zusammen, und haben sie reichlich Kost, so „feiern" sie stets.

25. Der Ausführende erhält kein besonderes Honorar, er wird verpflegt.

Bei Herstellung der Stirntatuierung legt sich der Patient mit etwas erhöhtem Kopf auf den Rücken. Die Stirnhaut über der Nasenwurzel wird von einem Manne zwischen Daumen und Zeigefingern zusammengefaltet und hochgezogen. Der Operateur schneidet dann die kleinen Querschnitte in die entstandene Hautfalte hinein.

26. Ziernarben bei Männern vertreten die Stelle eines Schußbuches. Für jedes erlegte Stück Hochwild läßt sich der Mann eine horizontale Ziernarbe anbringen, und zwar für männliches Wild auf dem rechten, für weibliches Wild auf dem linken Oberarm. Für kleines Wild (Ducker, Steinbock) bringen sich nur Knaben Narben an, Männer nicht. Ältere erfolgreiche Jäger verzichten schließlich überhaupt auf die Narben, nachdem sie genügend aufzuweisen haben.

29. Diese Ziernarben werden in ähnlicher Weise hervorgebracht wie die Stirntatuierung. Stets wird Schweiß (Blut) von dem erlegten Tier hineingerieben, meist auch der grüne Farbstoff. Die Jagdnarben werden von beliebigen älteren Männern ausgeführt. Die Länge der Narben beträgt etwa $^1/_3$ bis 1 cm, die Breite etwa $^1/_4$ bis $^1/_2$ cm.

Ziernarben (oder Tatuierung) bei Frauen.

Bei allen Frauen finden sich auf Oberschenkel und Gesäß bis zur Taille breite, grüne Ziernarben vor, wie sie auf Bild 14 ersichtlich sind.

Diese werden in derselben Weise wie die Stirntatuierung ausgeführt, aber von alten Frauen.

Eine genauere Untersuchung war nicht möglich, da die Buschleute darin, was ihre Weiber angeht, sehr mißtrauisch sind. Ich bin recht zufrieden damit, daß es mir gelungen ist, wenigstens eine Aufnahme zu machen, welche die Ziernarben leidlich veranschaulicht.

34. Die Ohrläppchen werden bei Männern und Frauen genau in derselben Weise durchbohrt, wie es bei uns üblich ist.

79. Eine Beschneidung wird nicht vorgenommen.

101. Eine Kürzung der kleinen Schamlippe soll nach Angabe der Auin manchmal ausgeführt werden.

103. Ausdehnung der kleinen Schamlippen wird angeblich ebenfalls in seltenen Fällen vorgenommen, und zwar durch Langrecken mit der Hand.

F. Kleidung.

1. 7. 8. Die Bekleidung der Auin ist auf den Bildern 25 10. und 26 ersichtlich.

Männerkleidung.

a) Mütze aus Fell (Schakal, Springhase, Erdmännchen, Katze).

a[1]) Kriegsmütze aus Fell des Erdwolfes (s. auch Bild 21), welche nur im Kriege aufgesetzt wird.

b) Schamlappen, stets aus Steinbockfell. Vom Schamlappen aus wird eine Schnur nach hinten durch die Gesäßspalte durchgezogen und straff am Hüftband, von dem vorn der Schamlappen herabhängt, befestigt. Der ganze Apparat wirkt dadurch ähnlich wie ein Suspensorium, indem die Hoden etwas gehoben werden (s. Bilder 9 bis 11).

c) Mantel, stets aus Steinbockfell.

d) Sammelsack, stets aus Steinbockfell.

Außerdem sind oft vorhanden: Sandalen aus 18. dem Fell einer großen Antilope, oder Laufsandalen (s. Fig. 5).

Fig. 5. Sandalen.

Fig. 5a. Ansicht einer Laufsandale von unten.
a glatter Teil, *b* nach unten umgebogene Spitze, *c* umgebogener hinterer Teil, *d* umgebogene Ränder, *e* Löcher zum Durchziehen der Befestigungsriemen.

Fig. 5b. Befestigung der Sandale.

Fig. 5c. Seitenansicht einer Laufsandale.
a glatter Teil, *b* Spitze, *c* hinteres Ende, *e* Löcher für Riemen.

Die Laufsandalen werden unter dem Fußballen befestigt und füllen ihrer Größe entsprechend diesen gerade aus. Die ganze Sandale ist so nach unten gebogen, daß sie beim Abstoßen des Fußes im Lauf die Schwingkraft des Körpers verstärkt. Sie besteht aus ganz hartem Gemsbockleder.

Eine Art Fächer, bestehend aus einem Schakalschwanz, der am Ende eines Stockes befestigt ist. Gamaschen aus Antilopenhaut. Letztere werden

von Männern und Frauen besonders im dornigen Gelände getragen. Dieselben ähneln in ihrer Form den griechischen Beinschienen.

Frauenbekleidung
(s. Bilder 27 und 28).

a) Kopfschmuck. An dessen Stelle wird bei weniger feierlichen Gelegenheiten oft eine Mütze nach Art der Friedensmütze der Männer getragen. meist ist der Kopf oben unbedeckt.

b) Schamschürze. Diese besteht, wie auf den Bildern 12 bis 14 ersichtlich, aus einem Bündel Lederstreifen, welche von einer Hüftschnur herabhängen. Die auf Bild 12 bei der Frau am weitesten links sichtbare Schamschürze mit Straußeneierschalen-Verzierung soll von Makoba eingetauscht sein. Eine hintere Schamschürze habe ich nie gesehen.

c) Mantel aus Ducker- oder Steinbockfell. Derselbe verdeckt stets das Gesäß.

d) Sammelsack (wie bei Männern).

f) Grabstock.

Kinderbekleidung
(s. Bild 22).

Mädchen: Schamschürze und Mantel.

Knaben: Schamlappen und Mantel. Sammelsack bei beiden vorhanden.

2. Die Kinder erhalten etwa im fünften Jahre den Schamlappen bzw. die Schamschürze.

9. Die Kleidungsstücke werden genäht. Es werden mit einem Eisenpfriemen, welcher aus irgendeinem gefundenen Eisenstückchen hergestellt wird, oder mit einem Knochensplitter Löcher gebohrt. Das Nähen erfolgt vermittelst Tiersehnen, welche durch die Löcher durchgezogen werden.

18. *) Als ich einige Auin-Frauen nackt photographierte, mußte ich dafür sorgen, daß sämtliche Auin-Männer, welche übrigens einverstanden waren, entfernt wurden. Mehrere Weiße und Hereros konnten jedoch zugegen bleiben.

G. Waffen.

1. Siehe Bilder 25 und 26:

f) Grabstock. Wird auch zum Schlagen und als Wurfkeule benutzt.

g) Bogen und Pfeile.

h) Wurflanze.

Sämtliche Waffen sind zugleich Kriegs- und Jagdgerät und werden auch gewissermaßen zu Sportzwecken benutzt, da Wettkämpfe damit ausgefochten werden. 2. 3.

Fig. 6. Lanzenspitzen. 1/2 nat. Größe.

Fig. 6c. Eisenspitze, welche in den Schaft eingesteckt ist.
a Kappe aus zusammengenähtem Leder.
b Eisenteil.
c Eisenteil, welcher in Schaft eingesteckt ist.
d Holzschaft.

Fig. 6d. Oberes Ende eines Speeres.

a Eisenspitze.
b Umwicklung des oberen Schaftendes (Lederstreifen oder Nackensehne einer großen Antilope).
c Schaft.

*) Ich weiß sehr wohl, daß Nachstehendes nicht als eine »Verleugnung des Schamgefühls« zu bezeichnen ist. Ich habe die Sache an dieser Stelle erwähnt, einfach, weil ich sie nirgend anders unterbringen konnte.

4. Mit Ausnahme der eisernen Spitzen der Wurflanzen werden sämtliche Waffen von den Auin selbst hergestellt. Die Lanzenspitzen gelangen durch Tauschhandel vom Ngamisee nach der inneren Kalahari.

Die Lanzenspitze (s. Fig. 6) ist der wertvollste Besitz des Buschmanns. Fast niemals wird man in einer Werft, auch wenn man sie überrascht, Lanzenspitzen vorfinden, sondern nur die dazugehörenden Schäfte. Der Buschmann ist in dieser Beziehung dermaßen mißtrauisch, daß er selbst innerhalb der Werft die Lanzenspitzen stets versteckt, meist vergräbt.

Jeder erwachsene Auin ist im Besitz von einem oder mehreren Speeren.

Die eiserne Lanzenspitze ist in den hölzernen Schaft, welcher am oberen Ende mit einem Streifen von Antilopenhaut oder Nackensehnen von Antilopen umwickelt ist, verhältnismäßig lose eingesteckt, so daß sie leicht herausgenommen werden kann. Die Lanzenspitze dient auch als Handwerkzeug an Stelle eines Messers.

Beim Tragen, was an einem nach Art eines Gewehrriemens verwendeten Lederstreifen geschieht, wird die Lanze oft durch eine kleine Lederkappe geschützt (Bild 251).

Figur 7. Bogenenden. 1/8 nat. Größe.

Fig. 7a.
Ende mit aufgestreifter Bogensehne.

a Bogen.
b Umwicklung aus Tiersehnen.
c Sehne, welche mit einfacher Schlinge aufgestreift ist.

Fig. 7b.
Ende mit befestigter Bogensehne.

a Bogenholz.
b b Umwicklung.
b' Widerlager für Sehne.
c Bogensehne.
c' Schlinge, welche festgezogen wird.

18. 29. Die Art, Bogen und Pfeil beim Schießen zu halten, scheint ziemlich willkürlich zu sein. Die gebräuchlichsten Methoden habe ich im Bilde festgehalten (s. Bilder 29 bis 32).

Die Bogensehne ist aus Tiersehnen zusammen- 20.
gedreht. Die Sehnen waren stets auf einer Seite aufgeschoben und an der anderen befestigt (s. Fig. 7a u. b).

Zusammengesetzte Bogen kommen nicht vor. 21.

Die Pfeile werden ausschließlich aus Schilf- 22.
rohr hergestellt, welches nur gerade gewachsen zu sein braucht, um den fertigen Pfeilschaft zu liefern. Am oberen Ende, wo die lose Spitze eingesteckt ist, und am Grunde, wo sich eine kunstlose, gewöhnliche Einkerbung befindet, ist der Schaft 26.
stets mit einem flachen, schmalen Grasbändchen umwickelt. Manchmal finden sich auch noch in der Mitte einige umwickelte Stellen. Die Länge des Pfeilschaftes schwankt zwischen 48 und 52 cm.

Befiederte Pfeile kommen nicht vor.

Die Herstellungskunst von Pfeilen und Pfeil- 23.
spitzen ist Gemeingut aller erwachsenen Auin. Besondere Pfeilmacher gibt es nicht.

Eine Ausnahme bildet die Herstellung der eisernen Pfeilspitzen, welche nur von einzelnen, meistens älteren Leuten ausgeübt wird.

Die Pfeilspitze ist ein mit sorgfältigstem Fleiß 25.
ausgeführtes Kunstwerk.

Die Knochenspitze wird angeblich aus Straußenknochen hergestellt. Welche Werkzeuge dabei verwendet werden, kann ich nicht angeben.

Vermittelst der Zeichnungen in Fig. 8 habe ich versucht, ein möglichst anschauliches Bild von Pfeilen und Pfeilspitzen zu geben.

Meist werden die Pfeile zusammen mit dem Bogen im Köcher lose getragen. Manchmal befinden sich die Pfeile in einem besonderen Köcher aus Elenhorn oder Holzrinde, welcher an beiden Enden mit einer Lederkappe verschlossen wird (s. Bilder 29 und 32).

Fast stets trägt der Auin im Köcher einen kleinen Behälter in Form des eben geschilderten Pfeilköchers aus Elenhorn oder Rinde, in dem sich Pfeilspitzen, Gift und anderer kleiner Schießbedarf befinden.

Das Kerbenende des Pfeiles wird beim Spannen 30.
des Bogens gegen die Brust gezogen.

Als einziger Kampfschmuck ist die Kriegs- 36.
mütze anzusehen, welche aus Erdwolffell (s. Bild 21) besteht.

H. Jagd und Ackerbau.

Man jagt sowohl einzeln als auch in Gesell- 1.
schaft.

Jagdhunde kommen ganz vereinzelt vor, sind 2.
dann aber meist von Kaffern oder Betschuanen bezogen. Die Auin behaupten aber, daß sie das Dressieren von Jagdhunden verstehen. Halsbänder usw. sind nicht gebräuchlich.

Figur 8. Pfeile und Pfeilspitzen. 1/3 nat. Größe.

Fig. 8i. Kerbenende eines Pfeiles.

Ob Eigentumszeichen an Waffen usw. angebracht sind, habe ich nicht ermitteln können, dagegen festgestellt, daß die Leute ihr Eigentum ohne weiteres sofort herauskennen. 3.

Schonzeiten gibt es nicht. 4.

Der Auin macht eine Art Dörrfleisch. Fleischstücke von beliebiger Länge und Breite werden ganz dünn (fast durchscheinend) geschnitten und auf Bäumen in der Sonne getrocknet. Die getrocknete, knüppelharte und für uns ungenießbare Masse hält sich in der Trockenzeit wochenlang. Es muß aber schon ein unendlicher Überfluß von Fleisch vorhanden sein, wenn sich der Auin zur Konservierung entschließen soll, da er sich bis zur Bewußtlosigkeit vollzustopfen pflegt. Ich habe es selbst erlebt, daß ein Buschmann einen ausgewachsenen Klippbock von etwa 6 kg Gewicht ohne Hilfe allein aufgegessen hat. 5.

Es gibt zweifellos besonders eifrige und passionierte Jäger, ebenso wie das Gegenteil. Ich habe einzelne Leute gefunden, die auf Jagd überhaupt nicht zu brauchen waren. 6.

Die Hauptjagdart ist die Pirsche mit Bogen und Giftpfeil. Ich glaube, es erübrigt sich zu betonen, daß der Auin wie jeder Buschmann ein unübertrefflicher Meister in dieser Kunst ist. Sein Schuß wird meist nur auf wenige Schritte abgegeben. Diese Jagdart ist auf beinahe jede Wildart anwendbar. 7.

Im folgenden werde ich zusammenstellen, auf welche Weise der Auin die Hauptwildarten zu erlegen pflegt. Die Erwähnung der Pirschjagd habe ich fortgelassen, wo sie nebenbei selbstverständlich auch angewendet wird.

Gemsbock und Wildebeest. Der Buschmann bleibt tagelang auf der Spur und läßt das Tier nicht zur Ruhe kommen. Schließlich jagt er es in einem finish Halali. Ein großer, verzweigter Baumast wird dem Gemsbock zwischen die Stangen geworfen. Während er sich damit beschäftigt, denselben loszuwerden, schneidet ihm der Buschmann die hinteren Beugesehnen durch oder wirft ihm den Speer aufs Blatt.

Dieses Einholen des Gemsbocks zu Fuß, welches stark nach Jägerlatein aussieht, findet seine physiologische Erklärung darin, daß der Buschmann dem Tier einfach keine Ruhe zum Verdauen und Wiederkauen läßt. Nach mehreren Stunden tritt dann eine Magenentzündung ein, die das Tier fast bewegungsunfähig macht.

Die anderen großen Tiere, wie Giraffe, Elen, Hartebeest, Strauß und Springbock, sind auf diese Weise nicht erreichbar, und bei ihnen beschränkt sich der Buschmann auf die Pirsche. Die kleinen

Böcke sind nur im nassen Boden, wenn sie tief einsinken, halali zu jagen. Sonst auch hier Pirsche.

Perlhühner werden angeschlichen und durch Werfen mit Steinen oder einem Stock erlegt.

Erdferkel wird ausgegraben. Der Buschmann macht sich an diese mühselige Arbeit doch nur heran, wenn das Erdferkel nicht allzu tief heruntergehen kann, also wenn unter dem Sand felsiger Untergrund zu vermuten ist. Er benutzt hierzu einen Spaten (von Weißen stammend), welcher meist im Besitze der Werft ist. Wie er es ohne einen solchen fertig bekommen sollte, ist mir nicht klar, da das Erdferkel etwa so schnell gräbt wie ein geübter Arbeiter mit Spaten.

Stachelschwein und Schuppentier werden ebenfalls ausgegraben.

Hase wird mit Stock geworfen. Die Jagd soll aber selten erfolgreich sein. Meist wird eine kleine Fallgrube auf dem Wechsel angelegt. Größere Fallgruben für Hochwild habe ich im Auin-Gebiet nie gesehen.

Springhase wird mit dem bekannten Angelstock der Südafrikaner, der bei den Auin nichts Besonderes aufweist, im Bau festgehalten (nicht etwa herausgezogen!) und gegen das Ende des Baues gedrückt. Dann wird von oben ein senkrechtes Loch gegraben und das Tier herausgenommen.

Klippschliefer. Die Ausgänge des Baues werden verstopft und dann ein Einschlag gemacht (d. h. von oben her hereingegraben).

Leopard wird nur gejagt, wenn mehrere scharfe Hunde vorhanden sind. Das Tier wird dann von diesen gedeckt, und von mehreren Buschleuten mit Speeren getötet. Ohne Hunde verzichtet der Buschmann auf dieses Weidwerk, was jeder Kenner verstehen wird.

Gepard wird zu Fuß von mehreren Leuten schlapp gehetzt und mit Knüppeln und Speeren erledigt.

Hyäne wird nicht gejagt. Nur wenn ein Geheck mit jungen Tieren in einer Erdhöhle gefunden ist, wird diese ausgeräuchert und die erstickten Tiere herausgegraben.

Erdwolf wird im Bau mit Rauch erstickt und ausgegraben.

Schakal wird nicht gejagt, da der Buschmann ihn angeblich doch nicht bekommt.

Wilder Hund (Lycaon pictus) wird ebenfalls nicht gejagt. Ich glaube, der Buschmann wird im Falle eines Zusammentreffens wohl meist selbst das Wild bilden.

9. Vereinzelt wird der Balg eines Straußes, in dessen Hals ein Stock gesteckt wird, als Maske verwendet. Der Jäger schlüpft in den Balg hinein, nachdem er seine Beine mit kalkhaltigem Boden grau gefärbt hat. Diese Maske wird auf Strauße wie auch auf andere Wildarten verwendet.

Andere Masken kann der Buschmann nicht herstellen, da er die Felle größerer Tiere nicht weich machen kann, ohne ihr natürliches Aussehen zu verändern. Gesehen habe ich eine solche Straußenmaske selbst nicht. Die Auin beschrieben sie mir aber so genau, daß ich nicht daran zweifeln konnte, daß Herstellung und Gebrauch ihnen bekannt war.

Der Fieplaut vom jungen Springbock, Ducker 10.
und Klippbock wird mit den Lippen nachgeahmt. Hierbei wird die Nase mit Zeige- und Mittelfinger zugehalten.

Ebenso wird das Angstgeschrei vom jungen Gemsbock und Wildebeest nachgeahmt.

Außerdem wird Ansitz bei Straußengelegen ausgeführt, um den Augenblick abzupassen, wo die jungen Tiere auschlüpfen. Will der Auin die Straußenhenne am Gelege zur Strecke bringen, so wartet er einen Moment ab, wo sich die Henne vom Nest entfernt hat und steckt einen Pfeil mit der vergifteten Spitze nach oben zwischen die Eier in die Erde. Wenn sich die Henne zum Brutgeschäft niedersetzt, so dringt ihr die Giftspitze in den Leib und sie verendet nach einigen Sekunden. Auf diese perfide Jagdart ist der Umstand zurückzuführen, daß man in der Kalahari unendlich viel mehr Straußenhähne als Hennen antrifft.

Treibjagden werden ausgeübt auf Gemsbock, 11.
Wildebeest, Hartebeest und Springbock.

Die Feuerjagd ist unbekannt.

Mit Schlingen werden gefangen: Steinbock, 12.
Riesentrappe, Ducker, Strauß, Perlhühner, Koran, Erdferkel, Springhase, Erdeichhorn, Sandhuhn, Steinhuhn, kleinere Katzenarten, kleine Antilopen.

Bei Tieren, welche Höhlen bewohnen, wie z. B. das Erdferkel, ist die Aufstellung der Schlinge gegeben. Dieselbe wird um den Eingang herumgelegt und an einem Baum festgebunden. Entweder beim Aus- oder Einfahren zieht dann das Tier die Schlinge zu.

Für Hühner und kleine Böcke werden lange Zwangswechsel aus Dorngestrüpp angelegt, welche mit engen Durchlässen versehen sind. Wenn das Tier den Durchlaß benutzen will, so gerät es mit dem Halse in die Schlinge, welche den Durchlaß umgibt. Ein Köder ist hierbei natürlich nicht erforderlich. Diese Zwangswechsel, deren ich bis zur Länge von 1000 m gesehen habe, bilden nicht etwa einen unpassierbaren „Kraal", sondern sind ganz niedrige, locker aneinander liegende Zweige, welche das Wild ohne weiteres überspringen kann. Das Wild hat aber die Gewohnheit, an solchen

Wechseln entlang zu trollen, bis es auf einen bequemen Durchgang trifft.

Strauße, Riesentrappen, Korane, Perl-, Sand- und Steinhühner werden mit dem Schwippgalgen gefangen. Ein Bäumchen, je nach dem Fangobjekt stark (beim Strauß natürlich muß es schon ein ziemlich kräftiger Baum sein), wird zur Erde gebogen und durch einen Strick in der Lage festgehalten. Der Strick endigt in einer Schlinge, welche auf dem Boden durch Holzpflöckchen festgelegt ist. Mitten in diesem durch die Schlinge gebildeten Kreise liegt ein Köder (meist eine Kugel von Baumharz). Durch eine einfache Verbindung wird infolge der Aufnahme des Köders die Schlinge frei, und mit ihr schwippt der Galgen zurück und reißt das Tier am Halse in die Höhe. Über das
25. Schlingenmaterial s. S. 153. Die Pfeilspitzen der Auin sind im allgemeinen vergiftet. Ich habe auch einzelne Pfeile vorgefunden, welche nur eine einzige, nicht vergiftete Knochenspitze hatten. Diese werden zu Sportzwecken, vielleicht auch zum Erlegen kleiner Vögel verwendet.

26. Herstellung des Pfeilgiftes. Burkea africana (Feuerholz des Buschmanns) wird in der Regenzeit von einem Käfer (oder Termitenart?) besucht, der sich gegen Ende der Regenzeit im Erdboden unter dem Baum verpuppt. Die Larven werden ausgegraben, getötet, an der Sonne getrocknet und zwischen Steinen gerieben.

Wurzeln der Dorntschammas (Cucumis heptactylus Naud.) werden in glühende Kohle gelegt, warm herausgenommen, und der bittere Saft wird ausgepreßt. Dieser Saft wird mit dem Giftbrei verrührt und ergibt eine schmutzig-rotbraune Schmiere, welche das fertige Pfeilgift darstellt. Das Gift wird in dicker Kruste von einigen Millimetern auf die Pfeilspitze aufgetragen und trocknet dort ein.

Die Buschleute fürchten ihr eignes Pfeilgift sehr und tragen die Giftspitze der Pfeile stets im Schaft verborgen. Erst unmittelbar vor dem Gebrauch wird die vergiftete Seite herausgesteckt. Die Giftschicht auf den Eisenspitzen, die sich ihrer Breite wegen nicht im Pfeilschaft verbergen lassen, ist stets mit Bast umwickelt, welcher erst beim Gebrauch abgenommen wird. Alle Auin können Pfeilgift herstellen und zeigen das Verfahren bereitwillig.

28. Als Jagdtrophäen sind die auf Seite 142 beschriebenen Ziernarben zu betrachten.

30. Jagerlatein soll vorkommen. Streitigkeiten hierbei finden manchmal blutigen Austrag.

32. Das einzige Haustier ist der Hund.

51. Der Buschmanndoktor soll Aderlaß zu Heilzwecken vornehmen. So z. B. wurden bei einem Manne, der nicht gut laufen konnte, blutige Einschnitte an den Oberschenkeln vorgenommen. Ich weiß allerdings nicht, ob man dies Verfahren als „Aderlaß" bezeichnen kann. Derartige Schnittnarben sind mehrfach gezeigt worden.

Das Instrumentarium besteht aus einem ge- 52.
schärften Stückchen Eisen.

Ackerbau ist unbekannt. Man kennt nur zu- 58.
fällig wachsende Nahrungspflanzen.

Um das Wachsen der Feldkost zu fördern, 71.
brennt der Buschmann das Gras ab. Ein Bergdamara, mit dem ich über ein brennendes Grasfeld ritt, sagte zu mir: „Der Buschmann macht seinen Garten".

Arbeit der Männer: 60.

- Jagd,
- Gelegentliches Feldkostsammeln,
- Holzsuchen,
- Wasserholen,
- Felle präparieren,
- Anfertigen der Kleider,
- Anfertigen der Waffen und Mörser,
- Anfertigen der Stricke,
- Feuerquirlen,

Arbeit der Frauen:

- Hüttenbau,
- Kochen,
- Feldkostsammeln,
- Feuer unterhalten,
- Holzholen,
- Wasserholen,
- Anfertigen der Weiberkleider.

Das einzige vorhandene „Ackergerät" ist der 61.
Grabstock (s. Figur 9).

Dem Nichtbotaniker ist es unmöglich, auch 65.
nur einigermaßen verständlich die zahlreichen wildwachsenden Nahrungspflanzen der Auin beschreiben zu können. Die Sammlung muß an Stelle der Beschreibung treten. Leider habe ich hierzu keine Gelegenheit gehabt.

Für denjenigen, der mit der südwestafrikanischen Feldkost Bescheid weiß, will ich einige Nahrungspflanzen aufzählen, womit diese allerdings keineswegs erschöpft sind.

- Tschammas,
- Stacheltschammas,
- Ontjes der Buren,
- Wasserwurzeln,
- sogenannte „wilde Kartoffel",
- Rosinkis der Buren,
- sogenannte „wilde Gurke",
- Pilze, welche an Termitenhaufen wachsen.

Gesammelte Feldkost wird in Stekchen aus 73.
Ducker- oder Steinbockleder in den Hütten aufbewahrt.

Der Auin legt auch im Felde kleine Vorratsmagazine an, indem er Säcke mit Feldkost eingräbt, ebenso vergräbt er Tschammäs oder mit Wasser gefüllte Straußeneierschalen. In Kronen großer Bäume findet man oft außer Tierfellen Vorräte von Feldkost aufbewahrt.

Fig. 9. Grabstock. 1/3 nat. Größe.

a Stock, *b* Grabspitze, *b'* dieselbe von der Seite gesehen.

76. Der Grundbesitz ist Gemeineigentum, das heißt, er gehört gemeinschaftlich einer Horde, die aus mehreren Familien besteht. Das auf diesem Grund vorkommende Wild, sowie das Holz und die Feldkost stehen ausschließlich zur Benutzung durch die Mitglieder der besitzenden Gemeinde. Darin vorhandene Wasserstellen stehen zur allgemeinen Benutzung, aber nur, wenn reichlich Wasser vorhanden ist. Wird das Wasser knapp, so hat der Grundeigentümer ausschließlich das Nutzungsrecht.

Die Grundbesitzer wohnen manchmal räumlich weit getrennt, so daß derselbe Grund und Boden von mehreren Werften ausgenutzt wird. Die Werften bestehen eben nicht aus einer ein für allemal feststehenden Anzahl von Familien, sondern finden sich von Fall zu Fall in beliebigen Gruppen zusammen. Wie aber auch die zufällige Zusammensetzung der Werften sein mag, immer bewegen sich die Angehörigen dieser Werften innerhalb eines ganz bestimmten Gebietes, und immer sind es die Angehörigen derselben größeren Horde, welche die Werften bilden.

Zwischen befreundeten Horden ist Jagdfolge erlaubt, d. h. ein auf dem Grund und Boden einer Horde angeschossenes Stück Wild kann auf das Gebiet der befreundeten Horde verfolgt werden. Von der Beute fällt ein Teil dem „Grundbesitzer", innerhalb dessen Gebiets das Wild zur Strecke kommt, zu. Bestimmte Verabredung ist in jedem Fall erforderlich, da der Buschmann jeden fremden Buschmann auf seinem Familiengebiet ohne weiteres attackiert.

Bei besonders befreundeten Stämmen ist die Ahndung einer Gebietsverletzung nicht blutig. Der Frevler wird verjagt, und außerdem werden ihm ganz wie in Preußen das „Schießgut" und die Beute konfisziert. Diese Flurpolizei übt jeder Buschmann auf seinem Gemeindeland aus.

Werden Weiber bei Bodenfrevel betroffen, so werden sie gefangen genommen und in die Werft der Bodeneigentümer geführt. Dies führt dann oft zum Kriege, wenn den Weibern bei ihrer Gefangenschaft in geschlechtlicher Beziehung ein Unglück passiert ist. Ehebruch rächt der Buschmann unter allen Umständen blutig.

J. Genußmittel.

Tabak, der nur als Einfuhrgut in Betracht kommt, ist äußerst begehrt. Eine Pfeife Tabak ist der höchste Genuß für den Auin. 1.

Tabak schnupfen ist unbekannt. 4.

Es raucht alles, vom kleinen Kinde angefangen. 6.

Figur 10. Tabakspfeife (Durchschnitt). 1/3 nat. Größe.

Die Auin verfertigen eine Tabakspfeife (s. Fig. 10) aus einem roten weichen Stein (Serpentin), der sich lediglich nur an der Wasserstelle Korikas vorfinden soll. Hier findet man unmittelbar über der Quelle auch tatsächlich eine Art von bescheidenem Steinbruch. 7.

Ein Bruchstück von diesem Stein wird mit der Lanzenspitze oder einem eisernen Messer konisch ausgebohrt und dann von außen her nach der Ausbohrung zu so dünn geschabt, daß die Wand etwa 2 bis 4 mm beträgt. Diese Pfeife ähnelt einer gewöhnlichen konischen Zigarrenspitze.

Ein Pfropfen aus dem Gewebe des Webervogels (?) verhindert den Tabak nach hinten zu fallen.

Vereinzelt sieht man noch einen Pfeifenstopfer oder Räumer, welcher meist aus Rosinkisholz ohne Rinde besteht und hübsch mit einer Art Brandmalerei verziert ist. Die Verzierung besteht aus Strichen und Punkten, welche mit einer glühenden Nadel eingeritzt sind. Auffallend ist die haarscharfe Richtung der Linien.

Der Pfeifenstopfer (s. Fig. 11) wird an einer Glasperlenkette oder einem Lederriemen um den Hals getragen (s. auch Bild 1 der zweite Mann von rechts).

8. Der Auin erhält den Tabak nur gelegentlich von Weißen, wenn er ihnen Dienste als Bote, Führer usw. leistet, oder von bei Weißen beschäftigten Kaffern, welche ihn gegen Feldkost eintauschen.

9. Hanf oder Dacha der Kaffern (Haium der Auin).

10. Hanf wird von Männern und Frauen gleichmäßig leidenschaftlich geraucht, und zwar aus den gewöhnlichen Tabakspfeifen.

11. Leute, welche durch Hanfgenuß erkrankt waren, habe ich nicht gesehen. Auch die Auin wußten nur, daß der Genuß manchmal Übelkeit hervorbringt.

12. Der Hanf wird von Kaffern in Oas und Betschuanen in Chansefeld, wohl auch von weißen Farmern angebaut und kommt durch Tauschhandel in den Besitz der Auin.

Die Auin behaupten übrigens, auch selbst Hanf anbauen zu können. Diese „Anbauung" geschieht folgendermaßen: Im weichen Sandboden wird eine kreisförmige Stelle von 30 bis 40 cm Durchmesser mit einem kleinen Damm von einigen Zentimetern Höhe umgeben und 10 bis 15 Löcher mit dem Finger in die vom Damm umgebene Stelle gemacht. In jedes Loch wird ein Hanfsamenkorn hineingesteckt. Die „Kultur" wird dann gut unter Wasser gehalten.

Das Verfahren haben die Auin den Bergdamara von Oas abgesehen.

Der Garungsprozeß ist unbekannt.

K. Spielzeug. Spiele, Sport.

4. Kleine Bogen und Pfeile dienen als Kinderspielzeug.

11. Vexierspiel, wird von jung und alt, Männern und Frauen durcheinander gespielt. Obige Bezeichnung habe ich nach dem Wesen des Spiels willkürlich gewählt.

Die Partner sitzen einander in Hockstellung gegenüber.

Beide klopfen sich gleichmäßig abwechselnd mit beiden Händen auf die Oberschenkel und murmeln dazu unartikulierte Laute ohne Bedeutung.

Der eine Partner streckt dann überraschend die rechte oder linke Hand gegen den andern aus oder macht irgendeine andere Bewegung mit der Hand. Es kommt nun darauf an, daß der Gegner dieselbe Hand sofort auch ausstreckt oder die entsprechende Bewegung mit einer ähnlichen beantwortet, kurz, sich nicht verblüffen läßt.

Figur 11. Pfeifenstopfer. 1/3 nat. Größe.

Beispiel für von Auin ausgeführte Verzierungen.

Die Zeichnungen sind auf dem Holz mit einer Nadel eingeritzt, die Punkte sind eingestochen.

a Loch zum Durchziehen einer Schnur.
a' Seitenansicht.
bb Larger Teil.
c Spitze.
d Seitenansicht der Spitze.

Der Buschmann an zweiter Stelle von rechts auf Bild 1 trägt den Pfeifenstopfer um den Hals.

Hat er die Bewegung z. B. mit der falschen Hand ausgeführt oder sonst einen Fehler gemacht, so markiert der Gegner seinen Vorteil ganz kurz dadurch, daß er eine wegwerfende Bewegung mit der Hand macht, oder mit dem rechten Zeigefinger auf seine linke Faust schlägt (soll bedeuten: „Ich schlage ihm, d. h. dem Gegner, den Kopf entzwei"). Unterbrochen wird das Spiel durch das rasche Markieren nicht.

Das Ganze spielt sich in einem ziemlich raschen Tempo ab.

Manchmal sitzen mehrere Männer einander gegenüber, die sich in den Partien ablösen. Auch kleine Jungen nehmen am Spiel der Großen teil.

Hereros und Bergdamara spielen ein ähnliches Spiel. Die Auin behaupten aber, es sei ein ursprüngliches Buschmannspiel.

Preise werden nicht ausgespielt. Es geht lediglich um die „Ehre".

Glücksspiel: Es hat große Ähnlichkeit mit dem Vexierspiel, nur daß die Teilnehmer außerdem noch mit den Knieen auf den Boden klopfen. Das „Töten", d. h. Besiegen des Gegners wird ohne Unterbrechung des Spiels durch lauten Ausruf angedeutet. Der ausgespielte Gegenstand (z. B. Tabak, Kost) liegt zwischen den Spielern und wird von dem Gewinner fortgenommen. Da die Wechselfälle innerhalb einer Partie aber zahlreich sind, so wandert derselbe Preis oft hin und her.

Ich habe dieses Spiel nur immer von zwei Männern (nicht Frauen und Kindern) spielen sehen. Man findet besonders passionierte Spieler bei den Auin, besonders unter älteren Männern.

Tanzspiel der Frauen (goei) (s. Bilder 36 u. 37).

Es ist mir zweifelhaft, ob ich dieses zu den Spielen oder Tänzen rechnen soll.

Einige Weiber stehen längs eines liegenden Baumstammes. Der rechte und linke Fuß wird abwechselnd taktmäßig je nach der Stellung mit dem vorderen Teil gleichzeitig von allen auf den Stamm aufgesetzt. So geht es fort, zuerst langsam, dann immer schneller. Stehen die Weiber mit dem Rücken gegen den Baumstamm, so wird die Hacke in derselben Weise aufgesetzt.

Manchmal stehen sich auch zwei Reihen Weiber dabei gegenüber. Es wird auch öfter eine Art taktmäßigen Singsanges dabei ausgestoßen.

Begonnen wird das Spiel auf den gleichmäßigen Ruf ‖ ai — etwa „jetzt los".

13. Gehörne von Böcken werden bei manchen Tänzen vor die Stirn gebunden (Elenbulltanz). Als eigentliche Maskentänze kann man sie aber wohl kaum bezeichnen.

14. Stelzen sind den Auin bekannt und werden von Männern und Knaben gebraucht. Gesehen habe ich übrigens keine, aber bei Beschreibung zeigten sich die Auin äußerst verständnisinnig.

18. Wettlaufen (Gâ).

Die Läufer bauen sich in einer Reihe auf, und auf „Gâ" läuft alles los. Der Sieger erhält einen Preis in Kost oder in Gestalt eines Gebrauchsgegenstandes (z. B. Messer).

Preisrichter sind ältere Leute. Blutige Streitigkeiten sollen bei Preiszuerkennung vorkommen.

Rutenwerfen (Gai oder Albi). 17.

Dünne Ruten beliebiger Länge bis zu 2 m vom Rosinkisbusch werden mit Anlauf in sausendem Schwunge vorwärts geworfen (nicht speerartig geschleudert, sondern an einem Ende gefaßt). Es kommt darauf an, möglichst weit zu werfen. Preise sind nicht ausgesetzt; es ist also ein echter Sport. Da die Sache ziemlich anstrengend ist, so wird das Spiel, wie übrigens alle andern auch, nur ausgeführt, wenn der Ernährungszustand ein guter ist, also zur Kostzeit (Regenzeit). Manchmal wird auch ein etwa $1^1/_2$ m hoher Sandhaufen aufgeworfen, welcher zu überwerfen ist.

Das Spiel wird stundenlang von Knaben und Männern unter großem Jubel betrieben.

Von Kaffern und Hereros wird dieser Sport ebenfalls ausgeübt. Die Auin geben an, daß es nicht ein ursprüngliches Buschmannspiel ist.

Ringen (s. Bild 34). Dieses scheint schon einen 21.
etwas ernsthafteren Charakter zu haben, da der Sieger den Unterliegenden schlecht behandelt und längere Zeit nicht mit ihm verkehrt. Die Buschleute bezeichnen es aber als Spiel.

Bogenschießen (unvergiftetes Pfeilspitzenende 23.
nach vorn). Ziel ist eine Tschamas oder sonst ein weicher Gegenstand, um die Pfeile zu schonen. Es wird einzeln von derselben Stelle geschossen. Anschlag stehend, knieend, sitzend, nicht liegend. Der Sieger erhält einen Preis (Kost, Messer pp.).

Speerwerfen. Das Ziel (Tschammas) wird auf einen Stock, der in die Erde gesteckt wird, aufgesetzt.

Auf 20 m traf unter 30 von 6 Mann ausgeführten Speerwürfen nur ein Wurf.

Ziel war ein Mehlkisteneinsatz.

Preise werden ausgesetzt.

Reiten (s. Bild 33). Zwei Männer bilden ein 27.
„Pferd", der dritte „reitet". (Gabi = reiten).

L. Musik.

Musikbogen von verschiedener Größe aus „Rosinkisholz" mit Tiersehne. Der Klöppel ist von beliebigem Holz.

Ich habe den Verdacht, daß die beiden Auin auf Bild 38 ein wenig gemogelt haben, denn der eine hat einen Schießbogen, während der andere einen beliebigen Zweig genommen hat. Sie werden wohl gerade keinen richtigen Musikbogen da gehabt haben. Allerdings kann man ja auf jedem gespannten Bogen „Musik" machen. Diese Musik ist übrigens auch für andere Leute recht vernehmlich, nicht nur für den Spieler.

6. Besondere Musiker gibt es nicht. Wohl aber findet man einzelne Leute, die an der Musik offensichtlich mehr Freude haben als andere. Ich habe einen Mann beobachtet, der in jeder freien Minute seinen Musikbogen benutzte.

9. Begleitung zum Gesang bildet taktmäßiges Händeklatschen.

13. Tanzrasseln (Guri) werden aus Kokons eines Nachtfalters angefertigt. Dieselben werden auf Schnüre gezogen und getrocknet. Solange die Kokons noch weich sind, werden kleine Steinchen oder Stückchen von Straußeneierschalen in den inneren Hohlraum hineingedrückt und die weiche Hülle darüber geschlossen (s. Bild 39).

Die hartgetrockneten Rasseln werden auf eine Schnur gezogen und am Unterschenkel befestigt. Sie sollen bei allen Tänzen Verwendung finden.

23. Kriegstanz (s. Bilder 41 und 42).

Die Weiber sitzen oder stehen klatschend und singend, die Männer hocken oder stehen gegenüber. Ein Mann rutscht auf den Knieen aus der Reihe heraus auf die Reihe der Weiber zu und deutet kriegerische Bewegungen an, wie Ausweichen vor einem Pfeil, Schleudern eines Speeres usw.

Eins der Weiber stößt einen Arm vor und einen tiefen kurzen Ruf aus und deutet hierdurch einen Speerwurf oder Pfeilschuß an. Der einzelne Mann markiert verwundet und schreit. Ist er „tot", kriecht er zurück, und ein neuer Solotänzer tritt für ihn ein. Auch Frauen sind manchmal „tot" oder „verwundet".

Unentschiedene Kämpfe werden angedeutet.

Es gibt auch hierbei ganz passionierte Tänzer und Tänzerinnen sowie solche, die ein besonderes Talent für Mimik haben.

24. Stachelschweintanz (s. Bild 40) wird nur von Männern getanzt. Einige Männer stehen einander gegenüber, stampfen taktmäßig auf den Boden und stoßen laute Rufe aus. Einer ist „Stachelschwein", welches von einem andern totgeschlagen oder mit dem Speer erstochen wird. Alles wird durch Bewegung angedeutet.

Elenbulltanz. In das Wesen dieses bekannten Tanzes habe ich nicht eindringen können, es scheint aber die Brunft des Elens dann nachgeahmt zu werden.

M. Transportmittel.

1. Buschpfade werden vom Buschmann in den Hauptverkehrsrichtungen, z. B. von der Werft zum Wasser, ausgetreten. Wenn ein Buschmann die Pad (d. h. den Weg der Weißen) benutzt, so hat er ein außergewöhnlich gutes Gewissen. In diesem Fall befindet er sich meist auf einem Botengang. Als Bote im Dienste von Weißen darf er auch feindliches Stammesgebiet (immer auf der großen Straße!) passieren, ohne daß ihm etwas geschieht. Es ist dies eine Konzession, die die Buschleute unserer Überlegenheit machen.

N. Handel, Geldsurrogate, Maße und Gewichte.

Zum Handeltreiben zwischen befreundeten 1.
Stämmen oder Werften begibt sich ein kleinerer Trupp Männer und Frauen (ein größerer Trupp würde Verdacht von Feindseligkeiten schaffen) zu der Werft, mit der gehandelt werden soll, und legt vorher die Waffen ab. Dann wird Erlaubnis zum Betreten der Werft eingeholt.

Befinden sich zwei Werften in Feindschaft, was übrigens der Normalzustand zu sein scheint, so gehen manchmal trotzdem Weiber zur feindschaftlichen Werft, um dort zu handeln. Es ist ein absoluter Tauschhandel.

Die Handelsbeziehungen sind trotz ihrer Urwüchsigkeit räumlich sehr ausgedehnt und erstrecken sich durch verschiedene Zwischenhändler vom Sambesi bis zum Oranje. Wohlverstanden kommt der Auin selbst niemals so weit herum.

Der Auin ist anscheinend im Verhältnis zu anderen Buschmannstämmen recht unproduktiv. Während z. B. der Kung die geschätzten und gut bezahlten Straußeneierketten anfertigt, der Noroon Fellkleider und Pfeilspitzen aus Knochen herstellt und verhandelt, scheint der Auin lediglich Zwischenhändler zu sein und gelangt auf diese Weise in den Besitz der begehrten Gegenstände.

Ich habe übrigens den Eindruck nicht gewonnen, daß der Auin Waren eintauscht mit der ausgesprochenen Absicht, dieselben weiter zu verhandeln. Vielmehr erwirbt er die Handelsobjekte zunächst für den eigenen Gebrauch, um sie später bei Gelegenheit wieder zu vertauschen.

Die hauptsächlichsten Tauschartikel sind: Salz 2. 3.
(kommt von Noroon), Pfeil und Bogen, Wurfspeerspitzen (Makoba), Holztöpfe, Holzschüsseln, Holzlöffel (kommen anscheinend von Ambos bzw. Owakwanguaris durch Vermittlung der nördlichen Hai ǁ um), europäische Storewaren von den Aikwe des Chansefeldes.

Innerhalb der Werften werden hauptsächlich 4.
getauscht: Feldkost, Fleisch, Kleidungsstücke, Gebrauchsgegenstände. Es scheint auch im engeren Kreis getauscht zu werden. Dem „Kind des Augenblicks" gefällt eben alle Augenblicke etwas anderes.

Märkte werden nicht abgehalten. 11.

Einen gewissen feststehenden Wert haben 12.
die Straußeneierschalenketten, da sie sehr begehrt sind. Eine Platte Tabak hat ebenfalls einen feststehenden Wert.

Dies will sagen, daß man unter allen Umständen, wo man auch hinkommt, beides los wird. Nur in diesem Sinne kann man von Geldsurrogaten sprechen. Ich bin überzeugt, daß man mit der genügenden Anzahl Plattentabak in der Tasche, ohne Proviant mitzunehmen, durch Tausch leben kann, d. h. wenn der Buschmann selbst gerade etwas hat.

Das einzige, was man vom Auin nicht unter allen Umständen gegen Tabak einhandeln kann, sind Lanzenspitzen.

26. Der Auin kennt nicht das bei uns gebräuchliche Angeben von Längenmaßen durch Aneinanderhalten von zwei Fingern einer oder beider Hände. Längen werden durch Anzeigen mit einem Finger auf dem Zeigefinger der anderen Hand oder auf einem Stock angegeben.

„Klafter" wird ähnlich wie bei uns durch Ausbreiten beider Arme angedeutet.

27. Als „Hohlmaß" gelten eine oder beide hohle Hände, letztere dicht nebeneinander gehalten.

Ein anderes Hohlmaß wird hergestellt, indem der Arm angewinkelt und die Höhlung zwischen Arm und Brust durch einen Lappen ausgefüllt wird; oder beide Arme werden vor den Leib mit geschlossenen Händen angewinkelt und die Höhlung wird mit einem Lappen ausgefüllt.

Bei uns sagt man auch „einen Arm voll".

Die Fellmütze dient ebenfalls zum Abmessen.

So roh die Maße sind, so haben sie doch anscheinend eine gewisse, natürlich ganz ungenaue Gültigkeit. Ich habe gesehen, wie ein Buschmann gegen Tabak „einen Arm voll" Feldkost einhandelte. Dem Tabakbesitzer erschien die erhaltene Ware nicht genügend, und der andere mußte noch „eine Hand voll" zugeben.

28. Gewicht wird geschatzt. Es wird natürlich immer ein Vergleichsobjekt vorhanden sein.

Die Schätzung wird in derselben Weise wie bei uns vorgenommen, indem die zu vergleichenden Gewichte kurz nacheinander etwas hochgehoben werden. Sogar der nachdenklich-schlaue Gesichtsausdruck dabei ist genau wie bei uns.

O. Technik.

1. Es ist eine ausgesprochene Hausindustrie vorhanden. Was der Auin wirklich notwendig hat, kann er auch selbst herstellen. Alle eingeführten Gegenstände sind Luxusartikel. Eine Einschränkung mache ich bei den eisernen Lanzenspitzen. Ich glaube aber, daß der Buschmann zur Not auch ohne diese auskommen kann.

2. Der Anfang einer Arbeitsteilung ist darin zu erblicken, daß nur ganz bestimmte einzelne Leute die Schmiedekunst ausüben, die sich übrigens nicht auf die Herstellung von Lanzenspitzen erstreckt.

Töpferei ist unbekannt. 3.

Töpfe, welche vom Okawango stammen sollen, sind vereinzelt vorhanden. Der Auin ist jedoch nicht in der Lage, eine Reparatur, wie z. B. Kitten, daran auszuführen.

Ringe von Grasgeflecht werden hergestellt. 9.
Ich habe sie nicht selbst gesehen, da sie nur aus jungem, aber nicht mehr grünem Gras hergestellt werden, also kurz nach der Regenzeit.

Angeblich sollen zur selben Jahreszeit von einzelnen besonderen Künstlern auch hutartige Kopfbedeckungen geflochten werden.

Grasringe und Hüte haben nur eine beschränkte Haltbarkeit, denn im September und Oktober konnten mir keine mehr gezeigt werden.

Siebe werden aus parallelen Grashalmen 14.
hergestellt, welche durch dünne Stricke miteinander verbunden sind. Sie dienen zum Durchsieben der Kost.

„Kirris" mit hübschen Verzierungen werden 17.
angefertigt (Fig. 12).

Ein Wurzelstock mit knotigem Ende wird geschält und geglättet. Eine Art Brandmalerei wird darauf ausgeführt, indem ein langer Streifen der abgeschälten, nassen Rinde unter Aussparung herumgewickelt und dann der ganze Stock in glühende Kohle gelegt wird. Die nicht umwickelten Teile brennen schwarz, während die anderen weiß bleiben.

Wozu die Auin diese verzierten Stöcke eigentlich gebrauchen, konnte ich nicht feststellen. Als Grabstöcke benutzen sie rohe, angespitzte Stöcke. Die Kirris scheinen demnach Luxusartikel zu sein.

Als Werkzeuge dienen eiserne Messer, geschärfte Eisenstücke oder Lanzenspitzen. Als Beispiel einer Brandmalerei siehe Pfeifenstopfer Seite 149.

Mörser und Stößel sowie Löffel aus Holz werden angefertigt (s. Bild 18).

Malerei und Herstellung von Rindestoffen sind 24-30.
unbekannt.

Die Bearbeitung von Fellen ist dieselbe, wie 31.
sie von Hottentotten, Hereros, Bergdamara und Betschuanen geübt wird. Ich verzichte daher auf eine Beschreibung.

Zum Färben von Kleidungsstücken aus Fell 32.
wird die früher beschriebene Schminke der Weiber angewendet. Die Farbe wird mit dem Handballen eingerieben und ist ziemlich regensicher.

Es ist allerdings zweifelhaft, ob man dieses Verfahren „Färben" nennen kann. Durch den Gerbungsprozeß sind die Felle sowieso schon rot, und die Schminke verändert die Farbe kaum. Vielleicht kann man es mehr als Imprägnieren bzw. Einfetten betrachten.

Die Farbsteine, deren Pulver zusammen mit Fett die Schminke ergibt, werden bei Kaitsaub (45 km südlich Gobabis) von den dortigen Hai || um = Buschleuten gegraben und bilden einen Handelsartikel.

Fig. 12. Keule. 1/3 nat. Größe.

34. Die wunderschönen und haltbaren Stricke der Auin werden aus der Faser einer wild wachsenden Agave angefertigt. Sie sehen so nett und sauber aus, daß man ihre Entstehung eher in einer europäischen Seilerei als in einer Buschmannwerft vermutet.

Die Stricke werden in verschiedenen Stärken hergestellt und zu allem möglichen verwendet, hauptsächlich zur Anfertigung von Wildschlingen.

Die Herstellung ist sehr einfach und geht äußerst rasch vonstatten.

Das Blatt wird mit einem Holzstock weich geklopft und dann auf eine feste Unterlage gelegt. Eine Hand setzt einen spitzen Stock oder ein stumpfes Messer auf das Blatt fest auf, während die andere Hand das Blatt gegen das senkrecht gehaltene Messer zum Körper hervorzieht. Nachdem dies mehrmals wiederholt ist, bleibt die feste Faser übrig, welche dann zu Stricken beliebiger Dicke und Länge zusammengerollt wird.

Eine industrielle Ausnutzung der Buschmannstricke scheint mir nicht unmöglich.

Als Bohrer wird die Lanzenspitze oder ein 44.
Eisenmesser verwendet, welche oft glühend gemacht werden.

Nur gelegentlich gefundene Eisenstücke kommen 53.
zur Bearbeitung. Die Gewinnung von Eisen aus Rohmaterial ist unbekannt.

Als Schmiedekohle wird vorzugsweise Holz- 54.
kohle von Giraffenakazie verwendet.

Ein an einem Stock befestigter Schakal- 53.
schwanz wird zur Erzeugung von Luftzug durch Fuchteln verwendet.

Als Blasebalg dient auch ein hohles Schilfrohr, durch welches das Feuer mit dem Munde angeblasen wird. Ob dies aber tatsächlich genügt, um Eisen glühend zu machen, kann ich nicht angeben.

Die Stelle von Hammer und Amboß ver- 52.
treten zwei Steine. Befinden sich Eisenwerkzeuge wie Beil usw. zufällig im Besitz des Auin, so werden sie natürlich vorgezogen.

Als Zange dienen zwei flüchtig zangenähnlich verbundene grüne Holzstücke.

Die Schmiede (nur einige meistens ältere 61.
Leute verstehen die Kunst) sind angesehen. Dies äußert sich darin, daß sie „überall Kost bekommen", wodurch die Auin anscheinend ihre besondere Hochachtung auszudrücken pflegen.

Figur 13. Beile. 1/4 nat. Größe.

Fig. 1. Beil mit senkrecht stehender Schneide.
a a Holzgriff. b Wurzelknoten. c Eisenspitze.

Fig. 2. Beil mit wagerecht stehender Klinge.
a'a Holzgriff. b Wurzelknoten. c Eisenspitze.
Die Eisenklingen sind von Makoba eingetauscht.

P. Politische Verhältnisse.

1. Der Auin ist, wie alle Buschleute, sehr kriegerisch. Jeder Mann und Jüngling ist waffenfähig und Krieger.

2. Kriegserklärung erfolgt nicht. Wenn aber ein Buschmann die Mütze aus Erdwolffell auf hat, so befindet er sich auf dem Kriegspfade (s. Bild 21).

3. Eine besondere Ausbildung in Waffenführung braucht nicht zu erfolgen, da das tägliche Leben ihn zur dauernden Verwendung seiner Waffen auf der Jagd zwingt.

4. Ich selbst habe keinen Krieg mitangesehen. Ein glaubwürdiger Kaffer schilderte mir einen mitgemachten Auin-Feldzug wie folgt:

Mehrere befreundete Werften kamen zusammen und beschlossen, eine andere Auin-Werft zu überfallen. Die Kriegsmütze wurde aufgesetzt und nach Sonnenuntergang in Richtung der feindlichen Werft abmarschiert. In der Nähe der letzteren wurde gehalten und, ohne Feuer anzuzünden (es war in der kalten Zeit!), der Morgen erwartet. Nach Sonnenaufgang, als es etwas wärmer geworden war, wurde die feindliche Werft umstellt und von allen Seiten überfallen.

Mein Gewährsmann erzählte, daß die Auin mit großem Schneid draufgegangen wären und sich in erster Linie der Lanze bedient hätten.

Der Überfall geschah unter lautem Schreien und Rufen; ein spezielles Kampfgeschrei war nicht herauszuerkennen.

5. Weiber wurden nicht mitgenommen; die Frauen der überfallenen Werft liefen sofort weg.

8. 9. Die Häuptlinge haben im Kriege allgemeine Befehlsbefugnisse. Ihre Autorität ist anscheinend nicht größer als im Frieden, wo sie verschwindend ist. Es ist allerdings für uns kaum verständlich, wie sich unter solchen Umständen ein glatter Verlauf eines Krieges gestalten kann. Alte Leute haben naturgemäß einen größeren Einfluß. Der „Doktor" ist lediglich Mitkämpfer ohne besondere Autorität. Im allgemeinen tut so ziemlich jeder, was er für gut hält; ein gewisses Zusammenarbeiten kommt schließlich doch heraus.

14. Bei Nacht wird nicht gekämpft, höchstens marschiert.

15. Bündnisse werden abgeschlossen, auch zwischen Stämmen verschiedener Sprachen. So z. B. verbanden sich Männer verschiedener Auin-Werften mit einer Naroon-Werft, um eine andere Auin-Werft zu überfallen.

Ein politischer Zusammenhang zwischen sämtlichen Auin-Werften ist nicht vorhanden. Die einzige Gemeinschaft bildet die gemeinsame Sprache. Bittere Feindschaft besteht z. B. zwischen den Auin von Gam und von Rietfontein, während das Verhältnis der Rietfonteiner Auin und der südlich davon wohnenden Naroon-Werften ein freundschaftliches ist. Verständigen können sich die beiden nur durch Dolmetscher.

Junge Leute, welche sich Freiens halber bei einer Werft aufhalten, nehmen an kriegerischen Unternehmungen dieser Werft ohne weiteres teil. Wie die Sache sich gestaltet, wenn sich die Unternehmungen gegen die Vaterwerft der Heiratskandidaten richtet, kann ich nicht angeben.

Kriegstanz mit begleitendem Gesang siehe S. 151. 16.

Gefangene Männer werden getötet, Knaben zumeist auch (Blutrachegefahr). 17.

Weiber und Mädchen werden mitgenommen, verheiratet und vollkommen in den Stamm aufgenommen. Alte Weiber werden getötet. Brauchbare erbeutete Gegenstände werden mitgenommen, der Rest wird zerstört.

Die Windschirme anzustecken lohnt nicht der Mühe.

Offizielle Friedensschlüsse finden statt; unbewaffnete Unterhändler scheinen freies Geleit zu haben. 18.

Kriegskosten in Gestalt von Kost, Gerätschaften und Frauen werden gezahlt.

Die Schilderung der Regierungsform ist so ziemlich das schwierigste Kapitel dieses Aufsatzes. 19. 21. 22.

Jeder erwachsene Auin kann eigentlich tun und lassen, was er will, vorausgesetzt, daß er nicht gegen die „gute Buschmannsitte" verstößt. Er erkennt anderseits aber auch wieder einen Häuptling an, welcher aber so gut wie nichts zu sagen hat. Hat der Häuptling aber z. B. ein Gewehr, oder ist er ein sehr starker Mann, so hat er einen entsprechend größeren Einfluß. Ich habe den Eindruck gewonnen, daß der Häuptling mehr eine repräsentative Stellung hat, die in erster Linie im Verkehr mit Weißen zum Ausdruck kommt.

Eigentliche Hoheitsrechte hat der Häuptling wie jeder andere Buschmann nur seinen Weibern und Kindern gegenüber, bei letzteren auch nur, solange sie klein sind.

Abgaben und Dienstleistungen gibt es nicht, ebensowenig wie äußere Abzeichen der Häuptlingswürde. 23. 24.

Die Häuptlingswürde ist im männlichen Stamm erblich. Das Erbe der Würde wird erst angetreten, wenn der Anwärter zu den Männern gehört, d. h. nach Schule (s. u.) und nach Erlegung des ersten Stücks Hochwild. Eine Stellvertretung während der Minderjährigkeit findet nicht statt. Es geht eben auch so! 32. 38. 42.

35. Die Werften (Dörfer) finden sich je nach Umständen zusammen und trennen sich wieder.

36. Der Häuptling einer Horde, die nicht immer in einem Dorf vereinigt ist, heißt Aichabn.

37. Bei einer Ansammlung von etwa 1000 Auin waren mehrere Häuptlinge vorhanden. Ein gemeinsames Oberhaupt fehlte.

45.46. Anscheinend sind es alte Häuptlingsfamilien, die diese Spuren einer Herrschaft innehaben. Sie bilden keine besondere Kaste und gehören keiner fremden Rasse an.

Q. Rechtspflege und soziale Verhältnisse.

1. Der älteste Sohn ist der Erbe des geringeren Nachlasses, der zunächst in einigen Gebrauchsgegenständen und Fellen besteht.

Die Witwe erbt nichts, behält aber ihr bisheriges Eigentum. Jüngere Söhne und Töchter erben nichts.

2. Die Blutrache ist der Grundbegriff, der den Rechtsanschauungen sein Gepräge verleiht. Der Sohn ist verpflichtet, den erschlagenen Vater zu rächen, der Bruder den Bruder. Ob sich diese Verpflichtungen auch auf entferntere Verwandtschaftsgrade erstreckt, konnte ich nicht ermitteln.

Ist der Mörder selbst verstorben oder nicht für den Richter erreichbar, so erstreckt sich die Blutrache auf dessen nächste männliche Verwandte.

Söhne, deren Vater ermordet wurde, sind zur Blutrache verpflichtet, sobald sie erwachsen sind.

Die Mutter des zukünftigen Bluträchers prägt während der Erziehung dem Sohne diese Pflicht ein. Sobald der Jüngling das erste Stück Wild erlegt hat, beginnt die Verpflichtung. Er wendet sich um Hilfe, die ohne weiteres gewährt wird, an seine Sippe. Ebenso findet derjenige, der Blutrache zu befürchten hat, Waffenunterstützung bei seinen Verwandten und Mitwerftbewohnern. Man kann sich denken, was für ein Rattenkönig von Blutracheverpflichtungen hieraus entstehen kann.

Es kann vorkommen, daß zwei Werften mit so viel gegenseitigen Racheverpflichtungen „hängen", daß ein Zusammentreffen zwischen Vertretern derselben ohne weiteres zu blutigen Tätlichkeiten führt. Hieraus läßt sich vielleicht auch erklären, daß manche Werften innerhalb des Auin-Gebietes seit vielen Jahren so verfeindet sind, daß eine Grenzverletzung ohne weiteres mit dem Tode bestraft wird.

Beispiel: Auin von Rietfontein und Gam. Selbstverständlich besteht noch öfter eine Todfeindschaft zwischen Buschleuten verschiedener Sprachen, wie z. B. zwischen Auin und Naroon, oder Auin und Genkuin. Auf den Stamm in seiner Gesamtheit erstreckt sich eine derartige Feindschaft anscheinend nicht, sondern ist wohl immer innerhalb einer bestimmten Anzahl von Familien und Werften begrenzt.

7. Die Grundlage der Rechtspflege bildet eine ausgiebige und energische Selbsthilfe. Zugefügtes Unrecht wird von dem leidenden Teil oder seiner Sippe durch Prügel oder Mord gerächt.

Als Beispiel für die Art der Selbsthilfe und die daraus entstehenden Weiterungen führe ich folgenden verbürgten Fall an: Ein alter Auin von Olifantskluft war bei seinem Schwager in Sidonitzaub zu Besuch. Der Gastgeber stellte eine Schlinge und fing eine Riesentrappe, welche der Gast fand, aus der Schlinge nahm und zu verzehren anfing. Der Gastgeber kam dazu und stach seinem Schwager den Wurfspeer in den Leib. Der Mörder floh, wurde aber von Verwandten des Erschlagenen eingeholt und erschossen. Jetzt herrscht natürlich Blutfehde zwischen den übrigens miteinander verwandten und verschwägerten Werften.

Interessant ist ferner der Umstand, daß die Auin von Sidonitzaub einen Boten zu mir nach Rietfontein, wo ich Stationschef war, schickten und mich fragen ließen, ob ich etwas dagegen hätte, wenn sie „Orlog" machten. Ich ließ ihnen sagen, daß mich die Sache nichts anginge, da der Krieg auf englischem Gebiet stattfinden würde. Leider wurde ich kurz darauf von Rietfontein versetzt, und so ist es mir nicht gelungen, dem Feldzuge als „Militärberichterstatter" beizuwohnen. Nach sicheren Nachrichten ist der Krieg inzwischen zum Austrag gekommen, wobei drei Mann gefallen sind.

Aus dieser Anfrage geht hervor, daß das „unglückselige Kind des Augenblicks" unter dem Druck der heutigen Verhältnisse sich nicht immer ohne weiteres den Eingebungen des Augenblicks überläßt.

3. Es ist kaum möglich, von den Rechtsanschauungen der Auin ein auch nur annähernd richtiges Bild zu geben.

Ohne Zweifel hat der Buschmann ein ganz bestimmtes Rechtsgefühl. Ich fühle mich aber nicht in der Lage, dieses mit unseren Rechtsanschauungen in einen verständlichen Vergleich zu bringen.

4. Etwas leichter ist es schon, anzugeben, was der Buschmann (Auin) für absolutes Unrecht hält, wie z. B. Mord, Diebstahl, Ehebruch, Verletzung des Familiengebietes, Wasserdiebstahl (letzteren nur, wenn wenig Wasser vorhanden ist). Jedenfalls läßt sich bei längerem Studium das Verzeichnis noch bedeutend erweitern.

5. Persönliches Eigentum sind Hütte (allerdings kein Wertobjekt), Waffen, Kleidung, Gebrauchsgegenstände, Felle, Schmuck.

Gesammelte Feldkost, erlegtes Wild und aufgesammeltes Wasser sind zwar auch persönliches

[p. 156]

Eigentum, unterliegen aber einem weitgehenden Kommunismus, der eine Einschränkung nur erleidet, wenn Hungersnot oder Wassermangel eintritt.

Gemeindeeigentum ist der Grundbesitz der Horde und darauf befindliches Wild, Feldkost, Holz und Wasser, letzteres mit Einschränkung.

Wenn ein Buschmann ein Stück Land abgebrannt hat, um das Wachsen der Feldkost darauf zu fördern, so hat er allein Anspruch auf die Erträge des Brandfeldes. Andere, auch Mitglieder derselben Werft, dürfen das Feld nicht benutzen.

Der Grundbesitz der einzelnen Horden ist genau abgegrenzt, und die Grenzen sind jedem bekannt. Grenzmarken existieren natürlich nicht, aber bei dem fabelhaften Ortssinn des Buschmanns weiß er ganz genau, bis zu welchem Busch, welchem Revier sein Gebiet reicht.

15. Standesunterschiede sind nicht vorhanden, ebensowenig wie es Diener oder Dienstboten gibt.

26. Begrüßung geschieht allgemein durch Handreichung, die von der bei uns geübten abweicht (s. Bild 43).

28. Sklaverei ist unbekannt. Kriegsgefangene Männer werden getötet, gefangene Frauen vollkommen gleichberechtigt in den Stamm des Siegers aufgenommen.

R. Ehe, Stellung der Frau, Kinder.

1. Männer heiraten etwa zwischen 16 und 18 Jahren, Mädchen zwischen 13 und 16. Beide Angaben beruhen natürlich auf ungefährer Schätzung.

2. 4. Die Werbung wird vom Ehekandidaten bei der Mutter des Mädchens angebracht. Ist diese nicht mehr am Leben, so vertreten die nächsten Verwandten (Vater, Onkel, Tante) deren Stelle. Der Vater wird erst an zweiter Stelle gefragt. Der Freier bringt den zukünftigen Schwiegereltern Geschenke in Gestalt von Wildbret und Feldkost, manchmal länger als ein Jahr hindurch.

Verläuft die Sache glatt, so führt er nach einiger Zeit das Mädchen in seine Hütte und die Ehe gilt als vollzogen.

Weigert sich das Mädchen trotz Einwilligung ihrer Eltern, den Mann zu heiraten (sie ist berechtigt, ihrem Willen Ausdruck zu verleihen und befolgt durchaus nicht immer den Wunsch der Eltern), so führt der Jüngling schließlich das Mädchen mit Gewalt in seine Hütte und vollzieht den Koitus gewaltsam. Läuft sie fort, so holt er sie wieder zurück. Auf diese Weise scheint der Widerstand allmählich überwunden zu werden.

Würde ein Mann ohne Einwilligung der Eltern einem Mädchen Gewalt antun, so würde er getötet werden.

Besondere Zeremonien bei der Eheschließung 3.
werden nicht vorgenommen. Die Ehe gilt durch den Koitus als vollzogen.

Das unmittelbar vor der Übersiedlung in den Pontok des Mannes vorgenommene Verlöbnis gilt als abgeschlossen, wenn der Mann das Mädchen, wie auf Bild 44 ersichtlich, um das Handgelenk faßt. Da „Verlobung" und „Hochzeit" aber zeitlich nur durch den Marsch nach der Hütte getrennt sind, so kann man das Umfassen des Unterarms der Braut als Vollziehung der Ehe betrachten.

Das Umfassen des Unterarmes geschieht ziemlich 6.
gewaltsam, und die Braut läßt sich beim Marsch nach der Hütte etwas ziehen. Sollte darin vielleicht ein Überbleibsel früheren Frauenraubs zu erblicken sein?

Eigenartig ist es, wie sich nach der Heirat das Verhältnis des Schwiegersohns zu seiner Schwiegermutter verändert. Der erstere vermeidet die Gesellschaft der Schwiegermutter und sitzt nicht mit ihr zusammen. Wenn er sich dem Lagerfeuer z. B. in der erkennbaren Absicht nähert, sich davor niederzusetzen, so geht die Schwiegermutter fort. Hat er notgedrungen mit ihr etwas zu besprechen, so schreien sie sich gegenseitig auf große Entfernungen an.

Vorehelicher Geschlechtsverkehr scheint kaum 7.
vorzukommen.

Ich habe zwei bis drei Kinder bei den meisten 11.
Frauen festgestellt, welche stets etwa zwei bis drei Jahre im Alter auseinander sind (s. S. 136).

Die Frau tritt zur Familie oder Werft des 13.
Gatten über, nicht umgekehrt. Zu Irrtümern mag Veranlassung gegeben haben, daß das junge Paar einige Zeit, etwa bis zur Geburt des ersten Kindes, bei der Werft der Eltern der Frau verbleibt. Später erfolgt immer Rückkehr zur Horde des Mannes.

Die eigene Schwester darf nicht geheiratet 15-19.
werden, ebenso natürlich nicht Mutter und Tochter. Andere Verwandtschaft bilden kein absolutes Hindernis.

Es ist aber die Regel, daß nicht innerhalb der eigenen Familie, auch möglichst nicht innerhalb der eigenen Horde geheiratet wird. Frauen werden mit Vorliebe weit hergeholt, oft von Stämmen anderer Sprache (Naroon, Genkuin, Hei-um).

Geburt eines Kindes bedingt keine zeitliche 25.
Trennung der Eheleute.

Die eheliche Treue scheint ziemlich gewahrt zu 27.
werden. Der Ehebrecher wird getötet, die Frau je nach Temperament des betrogenen Gatten behandelt, d. h. mit mehr oder weniger Prügel bedacht.

Ermordung der Frau wegen Ehebruch soll nicht vorkommen.

28. Ehescheidung tritt selten ein, und zwar nur, wenn die Frau gar zu alt geworden ist. Der Mann schickt sie dann einfach fort.

In den meisten Fällen bleibt sie aber auch im Alter bei ihrem Mann, welcher sich dann noch eine oder zwei jüngere Kräfte zulegt.

30. Die Kinder der geschiedenen oder verstorbenen Frau bleiben beim Vater und werden von der neuen Frau aufgezogen.

32. Witwen dürfen nach Verlauf einer gewissen Zeit wieder heiraten, ebenso geschiedene Frauen.

33. Eine Witwentracht besteht nicht.

35. Die Witwen wohnen in einer besonderen Hütte zusammen mit den jungen Mädchen.

17. Die Frau hat entschieden eine dem Manne ziemlich gleichberechtigte Stellung. Auch der Pantoffel wird oft ganz energisch geschwungen. Mahlzeiten werden in der Familie gemeinsam eingenommen.

38. Arbeitsteilung s. S. 147.

39. Die Rietfonteiner Auin haben durchweg nur eine Frau. Als Grund hierfür wird angegeben, daß „wenig Kost" vorhanden ist. Die Auin von Gam haben durchschnittlich zwei, manchmal fünf Frauen.

40. Jede Frau hat ihren besonderen Haushalt.

41. Die zuerst geheiratete Frau scheint eine Art Vorzugstellung einzunehmen. Es bleibt aber zweifelhaft, ob dies vielleicht nur dem höheren Alter zuzuschreiben ist.

47. So unwahrscheinlich es nach dem bisher Geschilderten klingt, so soll es doch auch Prostituierte unter den verheirateten Frauen geben, die für Geschenke gefällig sind. Wenn der Mann es erfährt, jagt er die Frau weg. Wie sich das mit der sonst geübten Blutrache verträgt, scheint mir nicht ganz klar. Die Auin erklärten mir, „wenn eine Frau sich mit vielen Männern einläßt, so kann der Mann doch nicht mit allen diesen Männern ‚Orlog' machen".

Es scheint dies anders beurteilt zu werden, als wenn eine Frau in einem speziellen Fall Ehebruch begeht.

51. Mittel zur Verhinderung der Konzeption sind unbekannt.

54. Künstlicher Abortus soll angeblich manchmal durch Treten auf den Leib der Schwangeren eingeleitet werden.

57. Über Kindesmord s. S. 136.

61. Der eheliche Verkehr wird erst im vorgerückten Stadium der Schwangerschaft unterbrochen.

62. Das Wasser und die Kost, welche von den Frauen während der menses geholt werden, wird nur von diesen selbst und alten Leuten genossen, jüngere „macht es schlapp".

66. Die Autorität der Eltern hört so ziemlich auf, wenn die Kinder in der Lage sind, sich selbst zu ernähren.

67. Die Namengebung erfolgt bald nach der Geburt durch Großvater oder Großmutter (ob väterlicher- oder mütterlicherseits war nicht festzustellen).

71. Die Geschlechtsreife tritt bei Knaben etwa zwischen 14 und 16, bei Mädchen zwischen 13 und 15 Jahren (ungefährer Schätzung) ein.

Die Reifeerklärung des Knaben ist ein besonderes Ereignis im Leben des Buschmanns. Mehrere Jünglinge von benachbarten Werften ziehen unter Leitung des „Doktors" in den Busch und leben hier einige Wochen gemeinschaftlich von Feldkost. Während dieser Zeit erhalten sie irgendwelche Unterweisung in geheimen Dingen. Daß diese Unterweisung sich auf das Geschlechtsleben bezieht, wurde von jungen und alten Auin, die ich unabhängig voneinander befragte, geleugnet. Auf die Frage, was bei diesem Leben im Busch eigentlich gemacht wird, erhielt ich immer die Antwort: „Es wird getanzt." Eine Art von Tanz wurde mir auch beschrieben, die entschieden etwas kindlich Geheimnisvolles an sich hat. Ein Junge setzt sich „Huckepack" auf den Rücken des andern, und beide hüllen sich in einen großen Fellmantel. Der Tanz besteht darin, daß der Träger so schnell als möglich ohne sich vorwärts zu bewegen, mit den Füßen auftrampelt, während beide dabei ein möglichst schauerliches, dumpfes „Hu, hu" ausstoßen.

Man kann sich allerdings kaum vorstellen, daß diese interessante Beschäftigung wochenlang, nur durch Schlafen und Essen unterbrochen, andauert.

Außerdem scheinen die jungen Leute bei dieser Vorbereitung ziemlich schlecht behandelt zu werden und wenig zu essen zu bekommen; denn alle stimmten in dem Urteil überein, daß es „übel" wäre.

Andeutungsweise erfuhr ich, daß die Mannbarkeitskandidaten den benachbarten Werften nächtlicherweile allen möglichen Schabernack zufügten und ein bischen „Gespenst" spielten, auch Nahrungsmittel entwendeten.

Die eigentliche Mannbarkeit, nach welcher die Knaben Krieger sind und heiraten dürfen, ist nicht allein von dem Besuch der Vorbereitung abhängig, sondern außerdem noch von der Erlegung des ersten Stückes Hochwild.

Die Tatuierung hängt nicht mit der Mannbarkeitserklärung zusammen. Bei Mädchen erfolgt keine besondere Vorbereitung. Sobald ein Mädchen die erste Regel hat, versammeln sich benachbarte und befreundete Werften zu einer größeren Feier. Das Mädchen liegt auf dem Boden, während alte Frauen mit Singen und Händeklatschen in ihrer Nähe die Kapelle bilden. Die jüngeren Weiber gehen stamp-

fend im Gänsemarsch vorwärts, wobei sie das Gesäß entblößt haben. Einzelne Männer treten von Zeit zu Zeit in den Reigen ein und alles ahmt die Bewegung und Laute brunstigen Wildes nach. Ich glaube, daß dies der Elenbullentanz ist. Erst nach Eintritt der ersten Regel ist das Mädchen heiratsfähig.

S. Geburt und Tod.

1. 2. Die Geburt geht im Freien außerhalb der Werft vor sich, während die Frau mit angelehntem Oberkörper und hochgezogenen Knieen am Boden sitzt.

3. Die Wiederbe'ebung scheintot geborener Kinder durch Reiben der Gliedmaßen und des Leibes ist bekannt.

4. Alte Frauen besorgen die Geburtshilfe. In schweren Fällen, z. B. wenn die Frau zur Zeit der Geburt krank ist, wird der „Doktor" zugezogen.

Dieser soll unter anderen Mitteln die schwere Geburt dadurch erleichtern, daß er mit dem Munde eine Art Ansaugen an der Scheide ausführt.

6. Zauberformeln werden vom Doktor bei Geburtshilfe gemurmelt.

7. Die Nabelschnur wird mit der scharfen Kante eines Schilfrohrsplitters durchgeschnitten, niemals mit einem andern Gegenstand. Praktische Gründe hierfür konnten nicht angegeben werden: „es war immer so."

8. Der Mann schlingt seine Bogensehne der Kreißenden um den Leib. Dann entfernt er sich und hält sich während der Geburt in seiner Hütte auf.

Eine symbolische Bedeutung der Verwendung der Bogensehne war nicht festzustellen. Die Erklärung war: „Die Geburt geht leichter."

9. Die Wöchnerin wird bis zu einem Monat nach der Geburt geschont und braucht nicht zu arbeiten.

10. Das Neugeborene wird mit dem Nest des Webervogels (?) abgewischt. Wasser wird in keinem Fall angewendet.

12. Bei Geburt von Zwillingen, welche anscheinend äußerst selten vorkommt, wird ein Kind getötet. Wenn es Knabe und Mädchen sind, wird merkwürdigerweise der Knabe getötet. Die Tötung wird gleich nach der Geburt von der Hebamme oder Mutter durch Begraben ausgeführt.

13. Geburt wird durch Tanz gefeiert, aber nur, wenn genug Kost vorhanden ist.

15. Gestillt wird zwei bis drei Jahre lang.

16. Es wird ein Unterschied gemacht zwischen Leuten die „gut", d. h. leicht und ohne schmerzhafte vorhergehende Krankheiten gestorben sind, und solchen, die unter großen Qualen sterben.

Erstere werden oberflächlich im Busch in der Nähe der Werft begraben und die Werft wird verlegt.

Letztere, welche der Buschmann wohl für besessen hält und auch nach dem Tode fürchtet, werden überhaupt nicht begraben, da man sie schon vor dem Tode verläßt und die ganze Werft fluchtartig das Feld räumt.

Falls begraben wird, so erfolgt es unmittelbar 17.
nach dem Tode.

Die Leiche wird in Hockstellung, Hände kreuz- 18.
weise auf die Schultern gelegt, zusammengeschnürt; die Kleidung behält der Tote an.

Das Grab wird ohne bestimmte Himmelsrichtung, so flach und klein wie möglich angelegt und nicht mit Schutzmaßregeln gegen Raubzeug versehen.

Bogen und Köcher mit Inhalt sollen an einem Stock aufgehängt werden, welcher über den Kopf der Leiche in den Boden gesteckt wird. Letzteres gebe ich mit Vorbehalt, da ich nie ein derartiges Grabmal gesehen habe.

Leute, die einen „guten" Tod gehabt haben, 22.
sind natürlich gestorben, die anderen sind behext worden. Ich gebrauche diesen Ausdruck, da er mir der Auffassung der Auin am nächsten zu kommen scheint.

Hat ein Auin einen anderen Buschmann ermordet, so schleppt er ihn unter einen Rosinkesbusch und legt ihn mit dem Gesicht nach unten auf den Erdboden.

Die Weiber der Werft beteiligen sich an der 23.
Totenklage der Witwe, welche in Heulen und Schreien besteht. Äußere Trauerabzeichen werden nicht angelegt.

T. Religion, Kultus, Mythologie.

Der Buschmanndoktor zaubert Regen herbei, 26.
indem er eine rote Erdart, die er von weit herholt und bei sich trägt, auf den Boden streut.

Ich halte die Doktoren, die an Stelle der Zauberer 27.
treten, für recht erfahrene Leute, die eine gute Portion Beobachtungsgabe besitzen. Dabei streuen sie ihren Klienten nebenbei reichlich Sand in die Augen. Die Seele der Toten stirbt nicht. Die 29.
Buschleute haben vor Verstorbenen und sogar vor dem Sterbeort große Furcht.

Krankheiten, die mit großen Schmerzen und 31.
Klagen seitens der Leidenden verbunden sind, gelten als durch höhere Macht (Dämonen) hervorgerufen, andere als natürliche Erkrankung.

Der Doktor exorziert, indem er den Kranken 33.
bespricht und schließlich mit einer Taschenspieler- 34.
bewegung ein Stückchen Holz usw. zu Boden schleudert, welches aus dem Körper des Kranken kommen und die Krankheit hervorgerufen haben soll.

Das einzige, was ich trotz wochenlanger ver- 69-76.
geblicher Bemühungen über religiöse Anschauungen

ermitteln konnte, ist, daß es eine höhere Macht gibt, die den Menschen schädlich sein und sie an schlimmen Krankheiten zugrunde gehen lassen kann. Diese höhere Macht, die gefürchtet wird, befindet sich „oben". Mehr als ein Hinaufdeuten in Richtung des Himmels konnte ich nicht erreichen, außer der Angabe, daß die gefürchtete Macht sich weit oberhalb der Baumkronen befindet.

Fig. 14. Prophezeiungshölzer. 1/3 nat. Größe.

a b c d Hölzchen eines Satzes. *d'* Seitenansicht von *d*. *e e* Löcher zum Aufziehen auf eine Schnur.

Die Prophezeiungshölzer bestehen aus einem Satz von vier verschieden geformten Hölzchen. Dieselben werden ähnlich wie unsere Würfel geworfen und aus der Lage wird dann die Zukunft vorausgesagt, z. B. ob die Jagd erfolgreich sein wird, oder ob es Krieg gibt.

Ein Auin behauptete, aus den Prophezeiungshölzern ersehen zu haben, daß „ein Ochsenwagen mit zwei Weißen sich der Werft nähere". Demnach scheinen die Hölzer zum Schwindelinventar von Leuten zu gehören, die, wie die „Doktoren", klüger sind als die große Masse.

78. Der Doktor ist Arzt und Zauberer. Priester ist er wohl auch, denn bei allen Fragen, welche sich auf Religion usw. bezogen, wurde ich immer auf den Doktor verwiesen, welcher angeblich darüber Bescheid wissen sollte.

Nicht jede Werft ist im Besitz eines Doktors. Zwischen Oas, Rietfontein und Ganab (100 km nördlich Rietfontein) war angeblich nur ein einziger vorhanden.

79. Der Doktor trägt den Schädel kahl rasiert. Außerdem soll er noch einige Schmuckstücke tragen, die kein anderer Mann anlegen darf.

80. Knaben, welche lange Jahre beim Doktor in der Lehre gewesen sind, können später, wenn sie ältere Leute geworden sind, ihren Meister ersetzen.

84. Bei der Krankenbehandlung scheint sich Schwindel mit einer gehörigen Portion tatsächlicher Erfahrungen und Kenntnisse zu mischen.

85. Für ihre Bemühungen werden die Doktoren bezahlt.

91. Es gibt auch weibliche Doktoren.

90. Von einer feindlichen Gesinnung dieser Leute gegen Weiße habe ich nichts bemerkt. Aber sie verstehen es noch besser als der gewöhnliche Buschmann, sich vor der Beobachtung zu „drücken", und das will viel sagen.

Der Doktor allein darf eine bestimmte Giftschlangenart essen, anscheinend die sogenannte schwarze Mamba, welche ich für eine Altersform der Cobra halte.

U. Totemismus.

Ich habe keine Anzeichen, welche auf das Vorhandensein von Totemismus schließen lassen, wahrnehmen können.

V. Medizin.

Ein Mann, der an Kopfschmerzen litt, hatte die 1.
Stirn mit einer angeblich heilsamen schwarzen Schmiere gefärbt und einen dünnen Riemen fest um den Kopf geschlungen. Unser Hausmittel, den schmerzenden Kopf seitlich mit beiden Händen fest zusammenzupressen, war den Auin bekannt.

Der Buschmanndoktor stellt aus der schwarzen 2.
Mamba, die er allein essen darf, ein Gegengift dar, welches gegen die Bisse aller Schlangen helfen soll, ausgenommen gegen den der Mamba selbst.

Er trocknet und pulverisiert die Lungen, Galle und Leber, sowie die Giftzähne mit Giftdrüsen. Dieses Pulver wird mit Fett derselben Schlange zu einer Schmiere verrührt, welche angeblich in die erweiterte Bißwunde, die vorher ausgesaugt worden ist, eingerieben wird.

Zugleich werden verschiedene tiefe Einschnitte am Oberarm und Brust gemacht, aus denen reichlich Blut abläuft.

Innerlich wirkende Gifte werden nicht hergestellt. Doch behaupten die Auin, daß das Pfeilgift auch innerlich wirken soll.

Die Herstellung des Pfeilgiftes wurde weiter 3.
oben beschrieben.

Giftige Pfeilschüsse in Brust und Leib werden als unbedingt tödlich bezeichnet. An Extremitäten sowie ganz oberflächlich sitzende Schüsse sollen unter Umständen heilbar sein, wenn sofort Hilfe geleistet wird.

Eine Schutzimpfung gegen Pfeilgift gibt es nicht.

Ein älterer Auin, welcher an stark entzündeten Augen litt, führte diese Erkrankung auf einen vor vielen Jahren erhaltenen Pfeilschuß zurück. Die Angabe ist natürlich unkontrollierbar.

Malaria ist endemisch und fordert jährlich viele 5.
Opfer. Besonders groß war die Anzahl der Todesfälle 1908/09. Ganze Werften sollen ausgestorben sein. Epidemien wurden auch von den „ältesten Leuten" nicht gekannt.

Geschlechtskrankheiten sind Segnungen der 6.
Kultur, aber anscheinend noch wenig verbreitet.

Hungersnot herrscht eigentlich in jedem Jahr 15.
gegen Ende der Trockenzeit, besonders wenn die vorhergehende Regenzeit schlecht gewesen ist. Zu dieser Zeit sind fast alle Auin zu Gerippe abgemagert. Tod durch Hunger soll angeblich nicht

vorkommen. Etwas zu essen, und wenn es Grassamen ist, findet der Buschmann schließlich immer.

16. Die sogenannten Doktoren verfügen entschieden über eine große Erfahrung in ärztlichen Dingen, was sie aber nicht hindert, außerdem reichlich in Schwindel zu machen (s. T. 27).

W. Zeitrechnung, Astronomie.

1. Der Tag wird nach dem Stand der Sonne eingeteilt.

2. Bestimmte Zeitabschnitte werden mit großer Genauigkeit nach dem Stand der Sonne angegeben. Wenn man einen Buschmann fragt: „Wie lange gehe ich bis zur der Wasserstelle?" so zeigt er die Stelle am Himmel, an der bis dahin die Sonne angelangt sein wird.

3. Der Begriff des Monats ist bekannt („gnui"— Monat).

5. Die Gleichung zwischen Sonnenjahr und Mondmonaten ist unbekannt.

6. Der Auin teilt das Jahr, für das er übrigens keinen bestimmten, sondern nur einen ganz ungefähren Begriff hat, ein in:

kalte trockene Zeit
warme trockene Zeit
kleine Regenzeit
Regenzeit.

Ebenso schwankend und unbestimmt, wie diese verschiedenen Jahreszeiten in der Kalahari einzusetzen pflegen, ebenso schwankend ist auch die Jahreseinteilung des Auin.

10.11. Es besteht nur eine Bezeichnung als Sammelname für den gestirnten Himmel.

12. Von einer „Geschichte" habe ich keine Spuren wahrnehmen können.

Nur Ereignisse, welche höchstens zwei Generationen zurückliegen, werden durch mündliche Mitteilung überliefert. 13.

Buschmannszeichnung kennen die Auin nicht. 14.

Bei der Wasserstelle Kazupitzaub zwischen Oas und Olifantskluft, also im Auin-Gebiet, sollen sich an Felswänden Buschmannszeichnungen befinden. Die Auin bezeichnen diese Zeichnungen als „Satanswerk". Ich bemerke, daß mir dieses Wort von einem Dolmetscher gesagt wurde, der mir keine bessere Übersetzung für den Buschmannsbegriff liefern konnte. Falls ich noch einmal in jene Gegend kommen sollte, werde ich darüber berichten.

Die Auin befinden sich in ihrem jetzigen Gebiet nach ihrer Ansicht: „solange es Menschen gibt". 19.

X. Zählen und Rechnen.

Finger und Zehen dienen zum Zählen. 1.

Fünf wird durch das Wort für Hand ausgedrückt, 10 für zwei Hände, 15 für zwei Hände und einen Fuß, 20 für zwei Hände und zwei Füße. 2.

Unter etwa 20 Rietfonteiner Auin befand sich nur einer, der über 20 hinaus zählen konnte. Ich kann aber nicht angeben, ob dieser nicht vielleicht erst durch mich darauf gebracht worden ist. Er zählte bis 40. 7.

Schluß.

Sollte man beabsichtigen, der Erforschung der Auin vermehrte Aufmerksamkeit zuzuwenden, so ist Eile geboten.

Die Auin werden der eindringenden Kultur sehr bald ihren Tribut durch Aufgabe ihrer Eigenart zollen, oder was nach den Erfahrungen der letzten Malariaperiode noch wahrscheinlicher ist, aussterben.

[1] Introduction

121 The purpose of my expedition, on which I was accompanied by my wife, Maria Lebzelter-Grammetbauer, was to study the anthropology and ethnology of the native tribes, especially of the Bushmen, as well as the archeology of South Africa. The original plan came from Professor Father Dr. Wilhelm Schmidt, S.V.D.
122 Repeated generous stipends from His Holiness Pope Pius XI made possible the continuation of the expedition, which was fostered with tireless zeal by Father Schmidt. The Austrian Government, by means of special administrative measures, made it possible for me to set out on this journey. Furthermore, the editor of Anthropos, Professor Father W. Koppers, repeatedly lent considerable support to the expeditionary fund. The Research Grant Board in Johannesburg granted me -- although for purely anthropological purposes -- a single subvention of 50 pounds.

114 I have already described the program and execution of my South African expedition in the first volume of this work. Here, before presenting the ethnological results, I should like to portray in rough outline how these results were arrived at. I must state in advance that there was a space of only three weeks between the time when the measures taken by the Austrian authorities made it certain that I could leave my homeland and my actual departure. Hence, a
[122] more detailed study of the native languages was out of the question. The conditions under which a person today can do ethnological field work are fundamentally different from those of the pioneering era.
[177] Through the activity of the missions, there is growing up among all
[177] tribes, except for the Bushmen, a stratum of intelligent individuals who, if not in this generation, certainly in the next, will take over
000 the research among their own people. I recall a lawyer's clerk in Natal (Swazi) who had acquired a pamphlet of ethnological lectures from Johannesburg and had learned it by heart. When he turned to a White ethnologist, in order to begin the practical work, the latter assured him that just as a race horse could not be used for plowing, so an ox could not be used for racing. Meanwhile, however, a number of very creditable works by natives have
115 already appeared in print. In my investigations I have always used native schoolteachers who had a command not only of the

[1 cont.]

115 German or English language, spoken and written, but also of their native tongue in grammar and phonetics.

000 Among the Zulu and Swazi I made my studies more as the occasion arose. Here I was indebted in particular to Father Andreas Ngidi in Inkamana, Princess Maris Dhlamini in Mbabane, and the Italian missionaries in Swaziland for my data. My travels were aided predominantly by the missions. Whereas in the diocese of the Catholic missions of Zululand and Marianhill the main emphasis of the work was upon anthropological and prehistoric matters, in Southwest Africa ethnological studies were the special [121] task of the expedition. Through the kindness of the provicar, 115 Father Schleipen of the Catholic Mission in Windhoek, the schoolteacher Alois Kheibeb was assigned to me, with whose help I came in contact with the old Dama. At the [2] Catholic Mission in Okombahe, Father Bachmann introduced me to the brother of Chief Gottlieb Horeseb, who came with a few other people to tell me stories. In Grootfontein it was Father Jaeger who placed his Dama schoolteacher, Nikolaus Horeseb, at my disposal. I then further succeeded in obtaining a very intelligent !Kung woman, Katiti, who was married to a Hei//om, and this made it possible for me to have verbal contact with the !Kung. In Ovamboland I was able to rely on the generous support of the Finnish Evangelical Mission. Through the help of Mr. Leuch I engaged a respected man from Oshigambo, Erastus Mbumba, who had been a clerk in Swakopmund for 13 years and who spoke superb German. The Bushmen informants in Ovamboland spoke Ovambo. In Epukiro the mission superior, Father Watterott, O.M.J., placed at my disposal the village headman, Franz Arenat, who in turn established contact for me with the Nogau Bushmen. The interpreters [124] have to be paid well. To all those who helped me in my work, I should like at this point to express my heartfelt thanks.

123 In order to achieve genuine success in the ethnological field, it is necessary to gain the confidence and sympathy of the natives and to instill in them the conviction that one has no evil intentions toward them or would want to make them look ridiculous; money alone does not suffice. The relationship between the 648 Whites and Coloreds is of such a kind that the native from the 576 outset faces the White with the greatest distrust. The natives are basically a courteous people, and among themselves they live

[2 cont.]

648 according to strictly regulated codes of conduct. No native would
576 say something unpleasant to another without cause. Modes of address such as are frequently heard among us, for example, "You don't look well, are you ill?" and similar amiable remarks, are out of the question. Each native expects to be treated in accordance with his social position. The natives cannot understand it when, say, a European traveler or missionary treats young people with extraordinary kindness; on the other hand, they find the casual treatment of older people and patresfamilias a sign of crude tactlessness. In Ovamboland, for example, the term of
123 respect for men is tati = "father." The ethnologist who treats
648 the grey-haired men of a native tribe as though they were old people of his own race who, in whatever position they may find themselves, have fulfilled their life's task and therefore deserve respect will have won half the battle. However simple and matter-of-course following this maxim might seem, in actual practice it turns out to be quite difficult in many cases. Quite aside from the fact that many a scholar sees in the native less a fellow human being than an object of study, the chief difficulty lies in the traditional forms of conduct that the Whites have adopted toward the natives. No native is allowed to sit on a chair in the company of Whites. In European houses there is usually a little bench in front of or behind the entrance door for black notables. The ordinary native is made to squat on the floor. It is maintained, not unjustly, to be sure, that this is the natives' original manner of sitting; nonetheless, the Black finds this manner of sitting a humiliation if it is forced upon him by the European. The native, in the view of the Europeans residing there, is simply an inferior kind of human being, with whom they do not even want to go to the same church, a circumstance that makes the task of many missionaries considerably more difficult. Should the traveler make a radical break with these customs and practices, he would have to forego the company and support of the Europeans, on whom he is, after all, dependent. Hence, an extraordinary measure of tact is required in order not to injure the pride of either the Whites or the natives. At the same time, it is true that among certain tribes, such as the Herero or the Ombarantu, the dislike of the Whites is so intense that useful

[2 cont.]

123 ethnological work among them, for the time being, is quite im-
648 possible. Even among the Bushmen the matter was by no means simple. Old Khame, who later became my good friend and informant, at first refused to help, saying: "Why should I open my heart to you, since I know very well that you are my enemy." The native also senses very accurately whether the respect one shows him is genuine. Finally, through the way he is treated, he suffers from inferiority complexes that make dealings [3] with him even more difficult. I have treated the natives as though they were Europeans, but naturally with due regard for the native forms of conduct, and in my relations with them I can say that I have been successful.

123 A single serious conflict with the natives can mean the end of an expedition. It is not just that the colonial authorities rightly grant permission to cross the police zone only to those people who have proved capable of getting along with the natives; another reason is the fact that the transmission of news among the
[203] natives is extraordinarily rapid. The news of my measurements in Walvis Bay reached the Otjiwarongo Reserve within 14 days, and from there it reached Otjituo in the extreme northeast in a week, not, as one might think, by postal communication, but through migratory Herero. Upon my arrival in Otjituo the people there were already acquainted with my intentions and my personality. The reader may possibly object to my actual accounts on the ground that I have succeeded in providing a fully rounded picture for only a very few tribes. I can truthfully say that there was a sincere intention to investigate the material thoroughly
[122] everywhere. I carried on the investigations among the individual tribes for as long as I had money available. It is impossible, after all, to depend entirely on a single informant; instead, several informants are needed in every case. Ethnological inquiries are practically the only situations in which the natives have the op-
123 portunity to lay down conditions. I can force the native to string
124 wire, to harvest maize, or to herd cattle as much as I want at the low price customary in the country, but I cannot force him to reveal his old tribal traditions. Not even the Bushmen wanted to take "brown money," but only "white" and "yellow." After I gained the confidence of the natives, as I can truthfully state,

[3 cont.]

123 the sum of the ethnological results obtained in each case is a func-
124 tion of the amount of "yellow" money that in each instance was available to me.

000 The results of my work, together with the space available to me, determined the size and content of this book. For the prehistoric cultures, I refer the reader to the first volume.

114 My original intention of giving a survey of those tribes
128 among whom I was unable to do research had to be abandoned in view of the amount of space placed at my disposal. I intend to do this in the final section of the third volume, where, along with the anthropological findings, an over-all survey of the cultural and racial history of South Africa is to be presented. I have
[127] referred to the literature at some length only in the accounts on the Bushmen tribes of South Africa. In particular the officers of the Imperial German Colonial Force performed extremely valuable pioneering work in this area. Their accounts, given with military exactitude, are unsurpassable and represent ethnological sources of the first rank.

126 Wherever I did not carry out the observations myself but wrote down the translations of my native interpreters, I have left them unchanged. Hence, I hope that the reader will not hold against me the stylistic defects that appear here and there. The native words for the most part were written down by my interpreters. I would have been happy if it had been possible for me to have all the texts checked by competent experts. This was impossible. I therefore request indulgence in case there are any errors in the linguistic transcription. At any rate, these people wrote their mother tongue. [Page 4 blank.]

[5] The Bushmen Tribes

172 In terms of geological eras, South Africa has undoubtedly been inhabited for as long a time as the other parts of the Old World. Naturally, the first cultures we know are those that possessed a stone industry. Among these the hand-ax industry, which is also the oldest elsewhere, is likewise widespread in South and Southwest Africa. Since Reck has most recently established

[5 cont.]

173 the Oldoway race as one of its carriers, the presence of a Eurafrican racial element from oldest times on may be regarded as certain also for South Africa. The carriers of this hand-ax industry, who, I am convinced, already carried on a kind of plant cultivation and were tied essentially to the forested zones, were later followed by a group of peoples and races with definite flake industries. Among these we may include the Katanga race and the other Australiform finds. A new wave of Eurafrican racial elements was brought by the carriers of the blade industries of the
174 Middle Stone Age of South Africa. Even today we are still unable to determine when the Bushman races adopted a Stone Age industry or even when they entered the country. Just as racially
[144] the Bushman incorporated remnants of all the preceding races or
[184] those that at one time existed side by side with them (Europoid -- Australiform), so their culture, varying from tribe to tribe, likewise constitutes a unity only in its optimal adaptation to the conditions of the environment. In its individual traits, on the other hand, it represents a residual culture whose stability depends on a selection intentionally and purposively carried out, and which resulted from foreign cultures from the Old Stone Age up to the present.

Chapter 1

The Bushmen of Angola

105 We are indebted to D. F. Bleek (1) for most of the data

[113] 1. D. F. Bleek, "Bushmen of Central Angola, " Bantu Studies, Vol. III, No. 2, 1928 Johannesburg. Further, Archiv für Anthropologie, 1930.

concerning the Angola Bushmen. The Bushmen are !Kung. The men are 159.3 (145.5-170) centimeters tall, the women 148.8 (135-161.3) centimeters. They live between the Msuma in the north, the Lomba in the south, and between Okawango and the

[5 cont.]

105 Ninde. They have stopped collecting veldkost and confine themselves to hunting, exchanging the products for vegetables and the like from the Mabunda [Bunda] and Luchazi, with whom they have a dependent relationship. Their time divisions are the same as those among the !Kung in the south.

The Angola Bushmen have two or three wives. Some of the married couples were cousins.

Each household has a number of calabashes, a few baskets, and a clay pot. Wooden pestles are used for pounding the grain, as in the south.

Among the Bushmen of Kunzumbia, the ear lobes and nasal septum are pierced. All adult men have tattooing on the forehead with vertical lines between the eyes. Furthermore, on the arm and chest they wear so-called "flesh marks" (2) [6] to

[171] 2. These are also found in Ongandjera and along the Natakanako Pan.

record the big game they have killed. The women, too, are tattooed. As weapons, besides bows and arrows, they have the kirri and a short knife. Spears are rare. Ironware, of course, is obtained in trade from the Bantu for the most part, although the Bushmen in Musombu already have their own forge.

[114] The rain dance is described by Bleek just as I have witnessed it. The women and girls stand in a group on one side, singing and clapping their hands, while the men also sing, but do not clap, and perform rhythmic movements with the upper part of the body and arms. They sing:

//nwa-se //kabama //gu a i-i New moon, come out, give us water
//nwa-se tatana //gu a i-i New moon, thunder water down for us
//nwa-se tala u//gu a i-i New moon, throw water down for us.

For the boys' initiation, the candidates withdraw into the forest with three medicine men for a month. There they dance at night, and occasionally the spirit Huwe appears at the dance. There is also a girl's initiation, and at that time another spirit, //Gaua, is supposed to lead the dance. The tattooing of the girls is done in his honor.

ANGOLA !KUNG WESTERN OTJIMPOLO VELD

[6 cont.]

105 In their religious ideas, the moon plays the chief role. The new moon is supposed to be a child or a man; the full moon, a woman. They also say that the moon is the older sister, and the sun, the younger sister. Besides the moon, Huwe and //Gaua appear as mythical personages. Instead of Huwe, they also say //Nwa-se, "little new moon." Bleek believes that Huwe is the spirit of the forest, who causes the growth of trees and grass and thus also the growth of game, therefore determining the success or failure of the hunt. Whether or not Huwe is worshiped could not be determined. It is interesting to note what is said concerning //Gaua: "//Gaua is another being. The people from Ngami Lake give the word three meanings: dream, ghost, spirit. Among the Angola Bushmen it is used sometimes for ghost, and sometimes more impersonally. A woman said: When a person dies, a ghost (//Gaua) comes from his grave, which can be seen by the medicine men." Thunder and lightning come from //Gaua. The person struck by lightning becomes a star in the sky. The stars are the campfires of //Gaua. The Bushmen are supposed to be the children of //Gaua. He is a man who lives in the forest, and his home is a hole in the ground. An informant explained that //Gaua is equivalent to Ndjambi (god). There are two kinds of medicine men: those who can see the spirits, conduct the boys' initiations, and do the tattooing, while the second kind cures the sick.

Chapter 2

The Bushmen of the Western Otjimpolo Veld

122 In Shandi, among the eastern Ukuanjama [Kuanyama], I was able to establish contact with the Bushmen through the kindness of the Resident, Mr. Eaddes, and of the native pastor, Paulus.
101 In part, these Bushmen were genuine !Kung, who said they were the same as those from Karakowisa, with whom, however, a fruitful understanding was impossible; and in part they were people who called themselves !Kung, but, judging by their language and customs, are southern Bushmen of Amboland. They themselves say that their fathers came from Ongandjera. The following

[6 cont.]

101 account refers only to the latter.

821 [7] The sky is designated by them as !nanu áiba Éroba Kharésa ("rain house of god").

776 For god they have the expressions "Erob" and "χ'amab"
775 only "Erob" is used in prayers. χ'amab (1) has been preserved

1. χ indicates a very low gutteral click, for which I know of no notation.

in χ'amá //gu Khe = "people who are with god," in other words, the souls of the deceased in heaven. Everyone goes there, the good as well as the bad. Erob has no wife and no children. A human being has only one soul (!gau-ba). This soul goes to the heavenly house and remains there "until Erob makes new people from it." Here is a belief in the transmigration of souls, which, it must be admitted, is not thought through any further.

No spirits of the dead remain on earth. There are little
776 bush spirits, the gangorob; they are harmless and do nothing. There are no evil little spirits. They supposedly know nothing about Heiseb and /Nawa.

136 The supply of game is ample in the tall dry forests of the Otjimpolo Veld. There are also fish in the rainy season. The
[825] Bushmen call them "shiba" (Ovambo: oshi or ochi); in other words, originally they had no word for them.

224 The Bushmen are helpless against the lion (χ'oréba).
[825] They leave a region as soon as lions make it unsafe. "There is no point in hunting them."

The leopard (χ'nába) is hunted with dogs (ariba). The
[439] chiefs of Amboland pay a good price for the skin, since little princes and princesses are not carried in a litter made of cowhide, but in a leopard skin. The jackal (≠Khai-eba) and the Löffelhund (//arúba) [a fox-like wild dog of the subfamily Octocyoninae] are hunted with enthusiasm. "Aruba" probably corresponds to N. //arob = striped jackal.

Wild dogs, "Khere," !nube (N. !goub) are preferably
[825] avoided. No notice is taken of the hyena, ≠Khai-lasa (N. ≠heirab),
[262] and it is not eaten. When they come near the camp, it is not a
[767] good sign.

[7 cont.]

222 825 The honey badger, !uisa (N. !ous), which leads to the bees, is followed ever so eagerly.

224 The common wild pig (gariba), the kudu (daub), the gemsbok χ'uaba (N. /gaib), and all the small antelopes are hunted. Pits are no longer known, although they used to dig them in former times.

If they decide to go hunting, sexual intercourse must be [834] avoided the night before. In the evening the hunters go into the forest and spend the night there. Before dawn they rise and pray:

[539] Pu, pu, Eró, /nari dsu /ari mate — God, tomorrow early we receive.

When a piece of game has been killed, one of the hunters cuts a piece of flesh from the animal's body and hands it to the leader of the hunt. This meat is called am-shái-khe. A fire is made, and this piece is placed on it. When it is roasted, the leader cuts off a piece and shouts:

[539] Ero, Ero, Ero, ha gore, ha gore — Erob, Erob, Erob, eat, eat
i Khe Khandi ô — With us flesh.

After a pause:

ha lĕ a lĕ ha góre o Khandi ô — Come! Come! Let us eat flesh.

Now the roasted flesh is consumed. Nothing is thrown away or left behind for Erob.

Then the game is cut up, and everyone goes home with his portion.

136 Snakes are not rare, although they are by no means as common as in the stony regions of the southwest.

The boa constrictor eats human beings; if it catches a Bushman, it starts to consume him at the legs!

132 821 731 In spite of the timber forest, the danger of drought is great. Erob sends rain. When there is a drought, the Bushmen dance and pray:

[539] Ero, Ero, Ero, /ga !goro — Erob, Erob, Erob, we are dying of thirst
/ga-wi -ma ta re — Water give us.

177 776 782 [8] It is very interesting to observe how in these certainly very ancient hunting and rain prayers the former old heathen gods' names Huwe and χ'amab were replaced by the Christian "Ellob."

I asked the people whether they knew any other prayers and received the following answer: "We know very well that

[8 cont.]

177 nothing can be done without Erob; we also pray to him whenever
776 somebody is ill, but we have no song for that, we do it in our
782 hearts." In these conceptions Christian influence is obvious.

881 They have no initiation for boys, but there is one for girls at the time of the first menstruation.

The girls' initiation is called "dorob."

At the onset of the menses, the girl becomes a "X'ába X'ábesa"; a special hut (omba) is built for her, where she is guarded by older women who feed her. The girl is allowed to eat anything, but nothing with her hands. When the menses end, a two-day festival begins, which terminates with a concluding dance. The candidate is seated in the center. Men and women go around
[534] her in a circle. The men blow on wooden trumpets. (These trumpets are made by the !Kung at only one place.) At the same time the drum is beaten (!guruba). At the conclusion, the women make "music." They clap their hands and sing:

[539] e-e-e-e-a-eje a jeja ni u u e . . .

Between times the drums and wooden trumpets sound.
539 Then the choral song of the men begins.

881 boro ai /i-he ≠hasa	Daughter my has become tall (just)
≠hau ge	Stand erect (tall)
/gai /ka uta (?) /noro-re	Good be now our little sunshine (1)

1. Literally: "Shine, you."

/ari ni tessa	Dance (2), sing, sue for her hand (3)

2. Literally: "Jump."

3. Literally: "Ask for!"

!goasa hi bare	People, be glad
Ti Komi !gǒǒ Kǒǒ...Kǒǒ... Kǒǒǒ	So, in this way, people, you should do it.

Then the dance begins anew.

[582] The engagement usually takes place long before the
585 girl's initiation. Hence the rule is that the wedding and the girl's
881

[8 cont.] HENCE THE RULE IS THAT THE WEDDING AND THE GIRLS
585 initiation coincide, and usually the girl moves to the village of
881A her first husband immediately after the completion of the festivi-
[591] ties.

584 When a man is courting, he must first attempt to obtain the consent of the girl. Once he has succeeded, he goes to the girl's parents. If they also give their consent, the engagement is settled. At this point, all communication is interrupted until the bridegroom appears and says to the girl's parents: "I want to have the wedding now." If the parents agree, they go to their relatives to spread the happy news. If the relatives object, they can still prevent the marriage. If they do not, the date of the wedding feast is fixed. In the bush, the bridegroom must bring the bride's parents a piece of big game. Usually people make matters
439 simpler for themselves. Either they have already earned a head
584 of cattle from a black farmer, and this stands ready in the farmer's
648 herd to be fetched for the wedding feast, or -- and this is more
452 common -- the Bushman will begin a begging tour around the black farmyards until someone gives him a cow as an advance on hides to be supplied later or on work to be performed.

452 And miraculously, this always succeeds. It is to be ex-
648 plained on various grounds. A black farmer, whose worst character traits include avarice and greed, would never give another Black who possesses nothing one of his dearly beloved cows on the strength of uncertain promises. And not unjustly. The next day the cow would have disappeared into the stomachs of the borrower and his friends, and on the day after that the borrower would have disappeared beyond the tribal boundaries. Repeatedly the Bushmen came to my camp too late. But from the Ukuanjama I always received the assurance: "The Bushmen will keep their word; they will certainly come if they are alive." In addition to this, of course, there is the symbiosis. Each village has its
[437] Bushmen. During the period of the harvest they suddenly appear
[9] and help with it. Between times they never miss a celebration, and at one time or another this one comes with hides and another with honey. And finally the chiefs of the Bushmen kin
[622] groups see to it that nothing happens to injure the reputation of
[674] the Bushmen. It is unheard of for these people to commit theft.

[9 cont.]

586 Up to the birth of the first child, the marriage is dis-
595 solvable, but not thereafter. Monogamy is the rule; where
596 there is polygamy, the first wife is the "head wife." The eldest
611 brother of the head wife is the family head. The boys belong to the family of the wife, and the daughters to the family of the father.

582 The strictest exogamy prevails. Son and daughter may marry neither into the father's kin group nor into the mother's
[587] kin group. On the other hand, a young widow is usually married by one of her brothers-in-law.

551 The following kin-group names were reported to me: !Nui-a, Dai, áben, orasi, Gombe, χ'am, χ'am-Kha.

805 The following times of the day are differentiated:

eruba, time before sunrise.

!khoasa, time of sunrise (N. khoa-am = to open, that is, the door for the sun is opened).

sorésa, "the sun shines."

sorésa ≠kam go, "the young sun goes," breakfast time. In effect, below the tropics one has the impression that the sun, after it has stood on the horizon for a while, moves toward the zenith with great speed.

sorésa !khoai go, "the sun goes back." Noon.

//gui-sa, "it declines (lies down)." Afternoon.

[512] ≠khai-am-go, "to rise and go." After hunting or searching for veldkost, the Bushmen usually take a rest before it is time to go home and start cooking (late afternoon).

≠kha-go, "to go through." (The sun goes through the gate of the night.) Dusk, sunset.

!khui-sa, to be evening.

dschu-ba, night (N. tsuχub).

821 These Bushmen have the idea that the old sun dies every night and a new, young sun appears the next morning. That the
[171] moon dies every month and is resurrected again is a notion so widespread in Africa that it is really unnecessary to make special mention of it.

805 The year begins when a new rainy season sets in.

//hauba, "storms rise." Rainy season.

[9 cont.]

805 shauba, cold season (N. sáob).

!kn-aba, hot season (N. !nái, warm).

535 Among dances, an ostrich and an ape dance were mentioned to me.

123 The studies, which began so promisingly, came to an end because I was evidently unable to present the village chief with enough presents. One evening a boy appeared and told me that the Bushmen had "had to go hunting." I continued to wait a number of days for the !Kung called by Mr. Eaddes. The messengers returned with the news that they had found no one. Another Sunday coat for the village mayor and some yellow money for the Bushmen, and priceless material could have been obtained.

[10] Chapter 3

The Dama Bushmen from the Palm Bush East of the Ondonga [Ndonga]

173 According to their tradition, these Bushmen came from Herero country. Hence they represent the connecting link between the "Saan" in the Gobabis district and the Hei//om [Heikum] of the north. The people as a whole designate themselves as Daman = the wealthy. The horde around Oshigambo calls itself //Huru-Khái. They call their dialect Cháraba. I do not believe that they live far in the interior of the Otjimpolo Veld. They have an enormous respect for the !Kung. The outermost cattle posts of the Ondonga probably coincide pretty much with the boundaries of their territory. A number of them are Bantuized and have small physiques. The others engage in hunting and supply the black farmers with the flesh of wild game, hides, ostrich egg beads, and poison. They serve as beaters on the great hunts of Chief Martin. At the court they count for nothing. The farmers like to see them. Little acts of assistance, a sack of berries or veldkost, soften the heart of the black housewife, so that here, as in Uukualuthi [among the Kualuthi?], there are a number of do-nothings who are nonetheless gladly received.

101
131
172
142
439
648

/10 cont./

123 Since I was able to become quite friendly with their "foreman," who possesses a small farm, I discovered some details concerning their outlook on life.

776 They believe in a supreme being which is not conceived of as a human being and which they call χ'amaba. Here we have H. Vedder's /Gamab of the Bergdama.

773 χ'amaba made everything, the sun, the moon, the stars, and also human beings. First he made the Whites, then the Blacks, and finally the Bushmen. They are unable to say how χ'amaba made human beings.

[372] The old Bushmen say that fire comes from the devil.
[776] Heiseb is the devil, according to them. Heiseb and the ostrich played together. The ostrich had the fire on his arm. While dancing the ostrich spread his wings, and Heiseb took the fire from him. Heiseb threw the fire brand behind him. There was a bush which started to burn. And there the people discovered the fire.

776 Heiseb is evil and only does evil. He is conceived as human in form. No one knows where he came from.

χ'amaba, on the other hand, is benevolent. People pray to him for help.

539 I took down the following prayers:

782 1. Prayer for rain: In olden times pieces of wood were
821 cut from the !Hawewa tree. It could not be felled. These pieces of wood were thrown into the fire, and as soon as the pungent smoke rose upward, the people sang in chorus:

χ'amaba duwa /gam-i-i a a God, give water to drink.
χ'amaba duwa /gam-i-i !hanusa God, give water rain,
anita(?) a a so that we may drink.

2. Prayer of thanks for rain: When the rain has finally come, a dance of joy is performed, and the following is sung:

χ'ámaba χ'ámaba χ'ámaba God, God, God
tūta tūta We have received, we have received
!hanusa /gam-i-i !hanusa /gam-i-i Rain water, rain water
tara ái /gam ái !hanusa tutasi We can drink, drink water, receive water.

[10 cont.]

539 χ'ámabe χ'ámabe χ'ámabe χ'ámabe God, God, God, God
782 /gami tara ái Water we can drink!
[821]
791
731 [11] In the waterless wilderness of the palm bush and the Otjimpolo Veld death from thirst often enough overtakes even the Bushmen, accustomed as they are to privation. They
[888] do not deny that at times they are forced to leave the old and
[758] the sick behind in the wilderness. But such an occurrence stays in the people's memory for a long time as a serious misfortune. Anyone who is acquainted with the Bushmen's love of children and veneration of parents and old people can understand what it means to them to be forced to leave behind one of their own.
271 One must have experienced personally the feeling that overcomes one when due to thirst and heat the body no longer gives off perspiration, the dry forehead feels burning hot, and a slight chill passes through the body, in order to understand this song of joy which seems so naïve, whose content is: We can drink again!

539 3. Short and fervent prayer at the beginning of a
782 journey:
[484] χ'ámaba !Khu gai teve God, let me travel well.

[755] 4. Choral prayer for a sick person: When someone is gravely ill, the relatives sing in chorus, while the doctor performs his ceremonies.

χ'ámaba !khoé-wa ≠khai khaíra téve God, let our people rise again.

789 5. Not a real prayer, but rather a formula of exorcism is said to oneself when meeting a stranger regarded as evil: Tshuai Kwewa /Nawa!

821 They do not know anything to say about the sun (sorésa). The moon (χ'áwa) dies every month and wakes up again.

753 Illnesses are sent by χ'amaba. He sends them to those
776 persons with whom he is angry. Other spirits have no role in this, and there is no spirit of sickness.

776 There is a host of little spirits, the /ga /ga hú, in the bush. They play tricks.

775 A human being has only one soul, !gaoba. This soul goes to heaven after death. (!nanu-aiba, rain house?) The house of χ'amaba (≠khauba) is there. Only the doctors know
[756] what it looks like up there. They speak with χ'amaba.

/11 cont./

775 "No spirits of the dead remain on the world; I have never yet seen any spirits, and I tell you only what I know. People talk a lot, but they know nothing." My informant thus concluded his statements concerning the beyond.

778 A sacred fire is unknown to the Dama Bushmen.

372 A youths' initiation is still performed by the !Kung in
881 the east. Among the Dama it is no longer held. On the other
184 hand, initiations for girls are still held, but they refused to give me any information about the details.

584 Marriage depends upon the free consent of the girl. To be sure, through the persuasion of the parents the girls always say yes. Once the girl has the initiation ceremonies behind her, a suitor soon approaches her to tell her that "she has now grown up and can become a wife." If the girl consents (after consultation with her parents), the suitor goes to his parents. He does not
585 consult his future parents-in-law. The bridegroom must bring a fat ox and a number of goats to the wedding. The parents of the bride likewise kill some animals. The actual ceremony consists of the bridegroom rubbing a thick layer of fat mixed with red ocher over the entire body of the bride, while the men sing:

[539] jejeje jejeje !hawawa !hawawa.

!hawawa means wedding. At the same time, the women and girls clap their hands.

177 Bantu influence is already strongly apparent in the mar-
582 riage laws. Thus, it is possible to "marry" even little girls, whom the man keeps with him until they are sexually mature. A
595 man may have as many wives as he wants. The first wife is not consulted when the husband wants to take more wives. My question concerning this matter was met with an outburst of laughter from the yellow-brown circle.

586 It is possible to send a wife away, but this is regarded as improper and indecent, and it is taken as an insult by the wife's relatives.

582 [12] A man can look for a wife wherever he wishes; only marriage with the children of the father's siblings, especially of his sister, is prohibited.

611 The daughter belongs to the family of the man, the son to the family of the wife.

[12 cont.]

843 The pregnant woman may eat no "ongaka" and no bush-
262 buck (okapundja, //airibkhe); she is allowed to eat hares.

844 Birth takes place in the hut. Men may not be present. As soon as the umbilical cord (//náëba) has fallen off, the child's hair is cut and buried. Then the child is carried out of the hut.
[553] The father receives it and gives it a name, which is chosen quite arbitrarily.

764 As soon as death occurs, the corpse is unclothed, wrapped in hides or blankets, and is placed in the grave on its left side in an extended position with the head toward the west. Brushwood is placed on the covered grave. People come there to weep. Offerings are not brought.

224 At the beginning of the hunt, certain ceremonies are
[177] performed, which I believe have in part been taken over from the Ovambo.

The hunters meet at a certain place in the forest (Khoá !Khuásha). Every hunter brings a twig with omsati leaves; these are thrown together in one place (omsati-//khái-wa), and a circle is drawn around it in the sand. Each hunter steps into the circle and on the leaves and says:
[539] //am ≠haiba, //am ≠haiba (?)
[782] The leader answers:

!Khu !Khu /ao /ao /auschá Lord! Lord! We must now go hunting!

When a wild animal has been killed, the lucky marksman first cuts a piece of flesh from it, roasts and eats it, and then divides the meat among his fellow hunters. No offerings are made.

224 This procedure is of the greatest interest. In the lower
422 form of hunting practiced by primitive peoples, the individual huntsman is the undisputed owner of the game he has killed. In the case of the more highly organized hunting that these Bushmen practice today, the property right of the individual hunter is still stressed through these ceremonies, although ultimately the hunter receives no more meat than his companions.

222 The gathering of veldkost does not have the great signifi-
[184] cance here that it does in the east. After all, the women already
[462] commonly cultivate a little garden plot, and the youngsters herd
[657] a few goats, while the men still practice hunting as their main
[233] OCCUPATION.

[12 cont.]

000 439 occupation. Even among the nomadic groups, however, meat, hides, and so forth are commonly traded for millet.

Also, the Blacks like to have veldkost on their table, [222] and the Bushmen, like our sponge and berry gatherers, use their knowledge to supply them and carry on petty trade with their veldkost, as well as with honey.

222 This is the reason that veldkost, which is either scarce 137 or not very tasty, is not gathered at all any more; indeed, the knowledge of its presence is even disappearing. We must also not forget that the black shepherd boys long ago acquired the knowledge of the Bushmen by observing them. As a result, the number of those interested has naturally climbed sharply, and the veldkost plants have become rare. The following kinds are still regularly gathered:

222 /airoba (ombimbo)	Sweetish, very starchy tubers, like large potatoes.
/érui (omauungá)	Galls on the leaves of the omsati tree.
≠gan-i (esarata)	Small fruit.
!Khui-i (oombi)	Dates.
!Korob-ke (oompali)	Bulbs at the roots of a liana.

251 Dried meat is made from kudu flesh, which in part is 439 kept and in part sold.

278 [13] Arrow poison is made from the sap of a tree (Euphorbiacea), !Khores-Ke. The Ondonga themselves make no [439] arrow poison, but buy it from the Bushmen for one to two sh per 752 portion. There is no medicine against arrow poison. Deep incisions are made at the place where the arrow entered, and after blood has flowed freely from the wound, it is sucked. In the case of snakebite the same procedure is followed, and some arrow poison is placed on the wound (!!!).

278 Our Bushmen denied any knowledge of poisons added to 609 food. Only the "evil Bushmen" in the east had such knowledge, they claimed. This statement scarcely deserves credence.

177 In clothing, dwellings, and weapons, as well as ornaments, not much that is original remains. The process of Bantuization is much further advanced in the material culture than in the spiritual culture. It is, after all, easier to part with clothing than with ideas.

[13 cont.]

Chapter 4

The Bushmen of Ukuambi

115 At an outpost of the Finnish Ukuambi Mission, where I undertook anthropological measurements, I encountered a Bushman from the hordes that live on the northern bank of the Etosha Pan and stand in a loose dependent relationship partly with Ipumbo, partly with Shanika. I was able to converse with him only a few hours.

101 These Bushmen in Ukuambi, as well as at other places, belong to the Ezimo of the Akuanambua. They themselves are [614] divided into a number of exogamous kin groups. My informant belonged to the clan Ari-Ari. The tribe calls itself Akese or Kere and comes from the region between Okaukuejo and Outjo. Today this tribal organization is broken up. The following names -- formerly independent hordes which now live mixed together -- were mentioned to me: /Aru-Kwe, Ashuche, Asécha, !Kuru-Kwei, A !Kha-ta-bé, A-Hei-tére, A !gnuri.

648 Insofar as these Bushmen do not already lead the life of the Bantu farmers, they are hunters, spies, and occasionally also executioners for the chiefs. They manufacture ostrich egg beads [+39] and poison. For twelve good ostrich eggs they receive a fat ox. The Ovambo have quite a peculiar outlook in this respect. They spurn the perfectly good eggs of their hens. The ordinarily somewhat "disreputable" ostrich eggs are purchased for dear money as a delicacy.

611 The sons belong to the family of the father, the daughters to that of the mother. The men are not allowed to eat hares, 262 but the women and children do. The eating of hyenas and boa constrictors is prohibited to all.

776 Concerning their religious conceptions I was able to discover the following: In the sky dwells the great captain !Khuwa, which means the same as Huwe. In answer to the question about God, however, he stated that this was Erob, which naturally coincides with the name for God, Ellob, of the Rhenish Mission. The name !Khuwa only occurred casually in the conversation. He was unable to give a clear answer to my question as to whether

[13 cont.]

776 !Khuwa and Erob were the same. In any case, the expression Ellob used by these people comes from Outjo, where there are a number of Christian Bushmen.

!Khuwa lives in the heavenly house χ'ain !nao gároba.
[772] The people in heaven eat only large flies, !Khu !Khua-i. The figure /Nawas is unknown. The evil antagonist of Huwe, //Gauab, is also absent. These Bushmen, however, have the same doctrine
[774] of the two souls as the !Kung of the east.

775 When someone dies, he becomes the property of !Khuwa; he is a !Khunga. The actual soul, χ'aobe, goes to the heavenly house, remains there, and does nothing but eat large flies. From the bodies of the dead [14] arise the //gauá-i, which run around in the bush and stir up trouble. They correspond to the akwapungu
[171] and azizi of the Ovambo. "But the actual souls of the Ovambo and the Bushmen go different ways; those of the Ovambo go under the earth where they have their fields and herds, but those of the Bushmen go up." Since the missionary Mr. Kylves expressed the desire to make some detailed studies of the Bushmen himself, I gladly left this attractive field of study to my kind host.

197 Finally, a number of words indicate that these people
192 are to be included in the Hei//om-Nama group, a point which
[101] is very striking with respect to the !Kung elments in their world view.

Chapter 5

The Bushmen of Uukualuthi

In all Uukualuthi, Uonkolonkathi, and Ombarantu, there
115 are, reportedly, only two Bushmen left who understand the old lan-
[177] guage. Both of them are good-for-nothing loafers who go from one beer pot to another. Thanks to the kind offices of the missionary, Mrs. Aarni, Chief Moala made one of these men available to me. To be sure, he could not hold out for very long, and during the few days that he devoted to us, he was rarely sober. We had to limit our conversations to the forenoon. What I learned from him is a dying way of life that no longer has any continuity. The man faced the situation with the cheerful resignation of the CHRONIC, GOOD-NATURED IMBIBER...

/14 cont./

000 chronic, good-natured imbiber . . .

776 In heaven there is one god, Erob. Lightning (dábara)
[821] and rain (!nanus) are sent by him. He calls heaven χ'ameiba. This word is very interesting. It can mean both "place of the /15/ souls (χ'a) " or "place of the χ'amab." The souls
[775] (um-ské) go to heaven after death. "This is what they say," said the man, "I haven't been there yet."

He did not know Gauab and Heiseb. Concerning other spirits, he said that people had mentioned them, but he did not believe in them. The spirits are supposedly called "gangarob."
756 The old Bushmen had neither doctors nor medicines against ill-
753 nesses. To my question about what made people ill, he responded with philosophical equanimity: "If one becomes ill, he is ill like an animal." He knew nothing about the sun (soris)
[821] and moon (χ'ab). A sacred fire is unknown to him.
[778]

224 Of greatest interest is his report, undoubtedly based
782 upon autopsy, concerning an initial offering at the hunt. I give the report in literal translation:

"Before people go out to the hunt, they meet at an omsati tree (//Khaia-aib). There a fire is made. Each hunter rips off a number of leaves, spits on them, and throws them into the fire as he shouts:

[539] Érob, Érob, áu tere! God, God, help us!

"When the game has been killed, one first cuts a piece each from the lung, liver, and stomach and throws each piece singly to the side, saying all the while:

Érob úre, Érob úre! God take, God take!

[539] "Then they start to eat."

This function is performed by the one who has killed the game.

881 The following was communicated to me concerning the
585 social organization:

There are initiation ceremonies. The celebration of the first menstruation originally coincided with the wedding. On the first day of menstruation the girl went into a pontok especially constructed for this purpose. Then there was dancing for two or three days, and after the cessation of the menses the girl went to

[15 cont.]

881 the man's encampment and took up married life. Nowadays the
585 first menstruation and wedding no longer always coincide.

584 The consent of the girl is absolutely necessary for the conclusion of the marriage. People often are betrothed already in childhood. Once the girl has grown up, that is, once she has become sexually mature, the suitor goes to the girl's parents. Neither the bride nor the bridegroom is allowed to enter the encampments of their prospective parents-in-law. If father and mother agree, then they go to the grandparents to obtain their consent. Then oxen, wethers, and goats are collected for the feast. Then the suitor goes to his parents, who in turn consult the grandparents. In the bridegroom's house also livestock is now collected, or, as the case may be, begged or purchased.
585 Then a great feast begins. There is dancing, and long trumpets are blown.

During the wedding dance the men sing:
[539] "Huwi é haa -- huwi é taa -- huwi áni taa." (The girl has grown up.)
The women clap their hands and sing:
"Jee jeee ja! jee jeee ja!"

881 A boys' initiation in the true sense of the term is no longer held. When the boy has grown up, however, a celebration
852 is held and livestock is killed. Similarly, when a child has been born, a celebration takes place, at which wethers or sheep are slaughtered. It is striking that among these Bushmen a sheep usually takes the place of the goat.

551 The boy receives the father's name; the daughter, the mother's name. The children belong to the family of the woman,
611 and the oldest uncle, or oldest brother of the woman, is the head of the family. It is prohibited to marry the children of the
582 mother's sisters.

The kinship terms are as follows:

601

German	Uukualuithi Bushmen	Nama
Father	//khum-khe	//gub, dadab, eib
Mother	//khums	//gus, is
Son	a χ'oron-khe	/gōab/gōb
Daughter	χ'ams-khe	/gōas/gōs
Brother	!gasab	!gasab
Sister	di !gas-khe	!gasas

[16]

	German	Uukualuithi Bushmen	Nama
601	Son of father's brother	awób (1) !garis-khe	--

1. In this connection cf. !awi (N.): "To bear the first child."

Son of mother's brother	/góa khoaba	--
Daughter of father's brother	//khum khoás	--
Daughter of mother's brother	//khum khoás	--
Father's brother	di khoáb-khe	--
Mother's brother	khoes-khe-khoaba	--
Father's sister	di-khoaba	--
Mother's sister	//khum khoás	--
Sister-in-law	//khum khoas	--
Wife	tarás	--
Husband	aubā	--

Khoás (pronounced like quás) corresponds to Khois in Nama. Khoib, however, means man, human being, friend, and comparative Khoi X a-Khoin = blood relative.

//Khum Khoas therefore signifies 'blood-related mother," which is properly applied to mother's sisters and their daughters and to the daughters of father's brother, but curiously enough also [582] to the sisters-in-law, probably because there is also a marriage prohibition with respect to them. Father's sisters and their daughters do not have this title, and one may marry these cousins.

Chapter 6

The !Kung Bushmen

131 The whole enormous region between Ewale, Ukuanjama, Oondonga, the Umaramba u Owambo up to its source, and from there across the farm bush veld up to north of Otjituo, and the whole Sand Veld east of the Omuramba Omatako to Alexeck on

[16 cont.]

131 the one hand, to the Okovanggo and the regions inhabited by the Bamangwato [Ngwato] west of Ngami Lake on the other hand, are inhabited by the tribes of the !Kung group.

Seiner (2) supplies the following apt division of this zone:

[113] 2. Mitteilungen aus Deutschen Schutzgebieten, 1914.

"The !Kung Veld forms the part of the Omaheke belonging to the northern Kalahari and is located between the Okovanggo (from Kagere to 19° southern latitude), the Kaukau Veld, the Sand Veld, the Karst Veld, the Etosha Pan, and the Otjimpolo Veld. -- The Kaukau Veld (according to Passarge, a plateau) is located between the Kung Veld, the Okovanggo, the Okovanggo basin, and the Sand Veld district. As the western boundary, in other words, toward the Sand Veld, the line Bogara -- Debra -- Blue Bush Pan in the western tip of the Okovanggo basin, close to the German border, should be adopted. The northern Sand Veld, through which I have traveled, can be delimited on the west by the line Nuragas -- Otjituo and by the valley of the Omatako from Otjituo to Okahitua; on the south by the line Okahitua -- Okosondusu -- Otjosonjou -- Epata -- Epukiro -- Rietfontein-East; on the east by the border zone of the Chanse Veld, the Okovanggo basin, and the Kaukau Veld. For the
137 northern boundary toward the Kung Veld, the factors of climate and plant geography must be taken into consideration, since there is no natural boundary here; the line Bogara -- Kanovlei -- Nuragas approximately forms the northern boundary of the Kalahari bush of the central Kalahari, which is sharply differentiated from the dry forest of the northern Kalahari. -- The loose,
[134] deep, leached steppe sand bears for the most part a tall, light xerophytic dry forest, usually with no underbrush and with deciduous trees that, as a result of the quantities of water stored in their root stalks and trunks, bear green leaves during the greater part of the dry season, and in part even bear blossoms and fruit during this season; this dry forest is a formation of
[134] relatively recent date. The vegetation of the firm, gray-humus, loamy river sand, or of the looser sand with ample ground

[16 cont.]

[134] saturation and ground water, is a dry forest of a different type
137 which corresponds to Warburg's lowland forest and, in contrast to the light dry forest of the looser sand, is distinguished by a relatively high density. -- The dry forest steppe occupies the largest areas of the !Kung Veld, and [17] lowland forest and grass steppe form only modest enclaves in it. Within the dry forest, at those places where the nature of the terrain makes possible the accumulation and preservation of relatively significant quantities of water or ground humidity, there are individual trees that are to be regarded as remnants of a former compact lowland forest, and the floristic composition of such forest islands leads to the conclusion that the entire region, with the exception of the primary grass steppes, whose floor probably never displayed taller vegetation because of its sterility, was once covered by a lush lowland forest as is preserved in its finest form at present in the northern Kalahari and in the 'rain forest' of Victoria Falls."

101 By the !Kung Bushmen in the narrower sense, who are
[131] divided into a northern group and an eastern group, I refer to those people who are located north of the police zone and south of the Okovanggo in the effluent region of the Omuramba u Owambo at the Löwenomuramba and on both sides of the lower and central Omuramba u Omatako. The groups in the source region of the Omuramba u Owambo have been studied by me in
174 greater detail. In former times, the !Kung undoubtedly lived much farther south and west. It is not improbable that they left the Grootfontein plain and the Otawi mountains under the pressure of the Hei//om, who in turn were forced out of the central region by the Herero. On the other side they undoubtedly gained space toward the south, for according to reports from the pre-war period, the Nogau were settled in the Sand Veld all the way to the vicinity of Otjituo, whereas today they have retreated
144 behind Alexeck. The racial composition of the !Kung Bushmen allows one to make a conclusion about their history. Among them we find a larger number of Europoid types than among the surrounding Bantu tribes. In addition, Austroloid influence is

[17 cont.]

144 obvious, and the southern Bushman race, that is, the one that displays the characteristics generally ascribed to the Bushmen as a whole, is found to be pure only to a modest degree which in-
137 creases toward the south. In the north, the !Kung Bushmen are
184 decidedly forest people, whereas in the Sand Veld they inhabit the shadeless low bush. The surface of the region consists of
134 areas of whitish sand, red toward the east and north, which is
137 streaked with strips of surface chalk. Along the Omuramba Omatako and parallel to it there are pseudo-dunes running north-northeast -- south-southwest and covered with dense thorn bushes. On the more clayey soils in the vicinity of the Omurambas [perhaps a local term for "rivers"] there is denser tropical dry forest. A reminder of more humid times is provided by three or four giant baobab trees that are dying.

Ludwig Zukowsky (1) reports on the fauna and flora:

[113]

> 1. "Beitrag zur Kenntnis der Säugetiere Deutschsüdwestafrikas [Contribution to the Knowledge of the Mammals of German Southwest Africa]," Archiv für Naturgeschichte, Vol. 90, No. 1, Part A, 1924.

137 "The Kung Veldt, a large deciduous broad-leaf forest
[136] region, bounded in the north by the Okovanggo, in the east by this river's flood area, in the south by the Dusche and Schadum, and in the west by the lower course of the Omuramba u'Omatako, is regarded by J.H. Wilhelm as a special faunal region, since here the most striking representatives of the Sand Veld, oryx, oribi, bubalis, guevei [blue duiker], and canis are absent and in their place new forms appear, such as damaliscus, schaeffia [?], and hippotragus. Red sand dominates the entire region, which is covered with sereng [Burkea africana], red bean trees [Copaifera coleosperma], mokussi (Baikiaca plurijuga), yellowwood [Terminalia sericea], dolf [Therocarpus erinaceus], and wild orange trees (Strychnos schumanniana). During the rainy season, when the trees are covered with leaves, the deciduous forest that covers the entire region remotely resembles a younger German beech forest. The chief tree is the sereng (Burkea africana) with its accompanying tree, the mokussi

[17 cont.]

137 (Baikiaca plurijuga), which have particularly thick trunks along the banks (dunes) of the large Omurambas. Another common tree is the red bean tree (Copaifera coleosperma), the yellow-wood (Terminalia sericea), sometimes in tree form, but more commonly in bush form as underbrush. In the northern part the Greesappelboom (Parinarium mobola) appears here and there, and, individually over the entire veld, the rattle tree or the wild orange (Strychnos schumanniana) and the dolf (Therocarpus erinaceus). The dunes of the Omurambas are covered not only with mokussi, but also with camel thorn trees (Acacia giraffa), hackie bushes (Acacia detinens), and another thorn bush (Acacia spec.). Between the large Omurambas, which extend to the flood area (Kaudum and Schadum), and between the Okovanggo and the Kaudum, there is a number of sometimes recognizable, sometimes overgrown Omurambas, such as Tschakaue, Gani, and north and south of the Kaudum, Tschaudum and Kuatschadum. The island-like appearance of Hyphaena ventricosa at the watering place Tschaudum is worthy of mention, 500 to 1,000 specimens occurring as isolated trees, as in the Grootfontein plain.
[133] In the entire region there are many hackie thorn bush islands and salt pans which have open water or water half a meter deep and are usually overgrown with reeds (Phragmites). The pasture is bad, with the exception of the Omuramba beds, which, like the Kaudum, for example, have a very high water level 20 to 50 centimeters deep. Long, hard grass or low leafy bush [Author: perhaps related to Dichopetalum venenatum (Machau), which occurs sporadically] is to be found here, whereas Bushman grass and knawel grass occur only among the thorn bushes. In the underbrush area there are species of Grewia. During the rainy season the ground is [18] covered with prickly cucumbers (Citrullus nausimorus), and onkies (Cyperus usitatus) grow under the hackie bushes. In addition, there are a great number of shrubs that bear a tasty bush crop during the rainy season. The baobab tree (Adansonia digitata), whose first representatives appear north of Dowigna in the Kaukau Veld, the morula tree (Sclerocaria schweinfurthiana), the manquetti tree (Ricinodendron rautannei), and the hartekohl tree (Combretum primigenium) are absent.
133 Pans of brackish water are absent; in their stead there are ef-
135 florescences of salt at various places in the Kaudum and Schadum.

ooo

[18 cont.]

134 The ground is covered with red sand (fox sand), which in the thorn bush areas changes to a firm, grayish-yellow; perhaps argillaceous sand. Chalk cliffs and other rocks are completely lacking. The Kaudum bed is perpetually covered with dense green grass. The sand pans have humous sand; only in the northeast near Schamatura is a peat-like swampy soil to be found with red, strongly ferruginous water. Forest fires are the order of the day, but they do little damage to the tree growth."

133 South of the Omuramba u Owambo there is a fairly large
134 number of limestone pans, which in part still contain water but are mostly dried up. The land there is drying up rapidly, according to both the Bushmen and the Europeans. During the rainy season the clayey soils are swampy, and at that time the
[136] dense bush forest is filled with myriads of mosquitoes, and
[164] malaria claims its victims from all races. The unhealthy situa-
648 tion, the difficulty of getting workers, and the irregularity of the rainfall have led to the abandonment of most of the farms outside Grootfontein, so that the Bushmen have actually gained ground there. The !Kung Bushmen outside the police zone live entirely according to their old customs and traditions. The in-
[578] dividual kin groups are in part hostile to one another. A kind
[619] of hereditary feud exists with the Hei//om, who are often attacked because of the women. The !Kung live on good terms with the farms along the northern boundary (Duwib, Keitsas, Keibeb, Kuntsas, Neitsas, Foxhof). Many of them work there for
[464] certain periods of time, and quite a few permanently; in particular, they like to let women and children work on the farms.
[177] Mr. Cleark, the owner of Keibeb, has trained a large number of
[439] them to make charcoal. These Bushmen make the charcoal out in the wilderness and deliver it. It is then resold to the mottramite mine in Abenab. Until the establishment of the police zone, a perpetual state of war existed between the police and the Bushmen. There are constant battles between the Herero of Otjituo and the !Kung because of livestock thefts. The Herero attack the Bushmen on horseback and kill them from the saddle with the kirri.

The Bushmen, who are not accustomed to shooting at rapidly moving targets, usually come out the losers. Like the

[18 cont.]

648 Nogau, the !Kung who are settled in the Sand Veld east of the Omuramba u Omatako are more hostile toward the Whites, and the attitude of the Whites and natives on the farms is correspondingly hostile toward them. This attitude is explained by the fact that only in recent times the Bushmen were forced out of the region west of the Omuramba and now have considerably reduced the scant living space of their brothers east of the dry bed. The living conditions in this region are hopeless. The !Kung live in symbiosis with the tribes along the Okovanggo. Lacking a stable social organization, lacking fixed dwellings in the narrower sense, the Bushmen is much less manageable than, say, the black farmers. Making the tribe collectively responsible, which is the best protection for the European, cannot be used against the Bushmen, and the likelihood of seizing a Bushman who has committed a crime on the edge of the police zone or outside it is zero. One must keep this in mind in dealing with them. On the other hand, I had no bad experiences with them.

[19] The Biological Bases of Life

1. The Number

161 Seiner has estimated the number of the !Kung at about 12,000. Since then, the wars of 1914-15, as well as the steady deterioration of the water conditions, have strongly curbed any increase, so that their number has certainly not risen in the last 20 years.

621 The basic social unit is the essentially patriarchal family horde, which on the average consists of one or two old men, four to six adult men, an equal number of women capable of bearing children, and a number of old matrons, as well as the 221 children. Toward the end of the winter they assemble in great 621 numbers at the few remaining watering places; they then meet again when the first veldkost ripens at certain places, frequently several hundreds of them; and then, when summer sets in, they again move in small groups to their family terrain. As examples, 161 I shall give four hordes for which I was able to determine the

!KUNG

[19 cont.]

approximate ages of the members:

162

	Horde I	Horde II	Horde III	Horde IV
Men	9	7	4	10
Old men	--	--	4	1
Women of child-bearing age	10	12	13	9
Matrons	4	9	7	6
Infants	6	6	7	2
Small children:				
Boys 1-4 years old	2	3	8	3
Girls 1-4 years old	3	4	6	1
Children:				
Boys 5-10 years old	4	4	?	?
Girls 5-10 years old	3	2	?	?
Young men	5	--	?	?
Young women	5	3	?	?

The above table thus has reference to 44 women capable of bearing children and to 38 marriages, of which two are polygamous. Four are widows. In these 38 marriages, there are 15 infants, mostly under one year old. To the extent it could be determined, 12 women were pregnant, and about five of them had [842] older infants. It would seem, then, that nursing beyond one year [853] affords no practical protection against a new conception.

833 183 The rule among the Nog-au that cohabitation with the mother may be renewed only when the baby is able to sit is well known, but it is not particularly observed.

165 With these 15 infants there should accordingly be 45 small children from one to four years old; in actual fact, however, there are only 30 small children, which gives an infant mortality rate of 33 per cent. This rate is no higher than is to be expected among primitive tribes in malaria regions; in fact, it is lower than in some native locations, such as East London.

[19 cont.]

162 In the age group of five to ten years, the number re-
165 mains the same.

The mortality rate is therefore very low, as among us, in fact, even lower, since the dangerous infectious diseases of childhood are absent. Insofar as the few figures given here permit one to draw conclusions, the sex ratio is 1:1. It is impossible to say what the sex ratio is among the adults. A great number
[123] of the men disappeared when I arrived -- since most of them had a bad conscience and did not want to be pinned down either metrically or photographically. It is certainly clear, however, that the higher the age group, the greater is the excess of women.

[20] Concerning the gray-haired individuals of an advanced age, in other words, over 60 years old, I counted four men and 13 women in the case of the four hordes mentioned above, in other words, a ratio of 1:3. As is the case among us, there, too, the women on the average reach a higher age.

161 C. v. François (1) on his journey to the Okovanggo in
[113]

1. Mitteilungen aus den deutschen Schutzgebieten, IV, 1891.

1891 estimated the population of the region at 500 Honigkaffir and Hei//om, 2,000 !Kung and 10,000 Okawango. The Bushman
[131] tribe of the Wasseckeri was supposed to live north of the Okovanggo, between the Kuando and Cuito. He calls the chief
133 of the northern !Kung the person best acquainted with the land, and this chief assured him that the water conditions had been much better in earlier times. Many of the vleis that are now dry formerly had water the year round. The Okaluombe (Apato) is supposed to have formerly flowed into the Ngami.

Theodor Leutwein (2) reports:

[113]

2. Elf Jahre Gouverneur in Deutsch-Südwestafrika [Eleven Years as Governor in German Southwest Africa], Berlin, 1906.

648 "North of Grootfontein at Gaub, a place with ample
621 water, a number of Kaffir and Bushmen had formed a village and
622

[20 cont.]

648 put themselves under a chief, a Herero half-breed named
621 Krüger, whose position was acknowledged" (see p. 87). "In
622 Naidaus a Bushman leader named Aribib introduced himself, who, like Krüger in the east, was recognized as the captain of the Bushmen in the west" (p. 88).

114 "During the journey of Captain Volkmann in the year 1902 to the Okovanggo, the !Kung Bushmen provided extensive help. Volkmann describes these !Kung in the following manner:
147 'The Bushmen, who are almost totally naked, are very sensitive to the cold. In the morning each Bushman has a burning log in
372 his hand, which he holds close to his chest. The other hand is placed on the shoulder with the upper arm pressed close to the body. At the resting place the log is used immediately to make
481 a fire. When a Bushman walks in front of the horse as leader, he
222 springs with incredible speed, now here and now there, to get a tuber or root out of the ground. Various berries growing on low
276 shrubs are also very popular. Anything that can serve is used as a tobacco pipe: kudu horns, calabashes, hollowed fruit of the Strychnos, old metal cartridge shells, and so forth. Most of all they like to smoke through water, which is never renewed. When they run out of tobacco, they boil the bark of a tree in the thick tobacco water, dry the bark, which has some tobacco taste, and smoke it'." (p. 180).

101 F. Seiner reports the following concerning the divisions
131 of this tribe:

"The Kung, to the best of our present knowledge, are divided into four groups. The western group seems to extend from the Portuguese border near Kurinkuru along the route via Tschitschib to the Omuramba u Owambo and then seems to be bounded by the latter and in the east by the line Nuragas--Blockfontein. The Karakuwisa group bordering them to the east inhabits the valley of the Omuramba u Omatako from Karakuwisa to Blockfontein during the dry season, and during the rainy season also the steppes 100 to 150 kilometers east and west of the Omuramba and the latter itself up to the Kanovlei. The more southerly group extends from the latter in the Omuramba to around Osondema; we shall call these Nog-au, who have already settled in the central Kalahari and can scarcely be classed with

[20 cont.]

101 the half-breed Bushmen, the Otjituo group. The Gam supposed-
131 ly dwell in the region west of the Omatako valley from Okanakasewa to Omambonde. The most serious complaints are
[648] lodged against the western group, which, in the opinion of the
[631] District Office, is for the most part under a single head chief, the notorious Namagorub, and is called !Kung-au (that is, !Kung people) by the other Bushmen. The Karakuwisa chiefs, Gnani and Ma, both crippled, are worth mentioning, and further, the leaders of the burglars of Blockfontein, Gachu and his brother Tamburi; no one, however, has as much power as the notorious Namagorub."

According to Vedder, the Bushman tribe of the Masi-
[197] Keren live in the forests south of the Otjimpolo Veld. They do
[342] not understand the !Kung language; they live communally in
[301] large rectangular houses and make incisions in the upper thigh
[827] in order to be able to run better. Their arrows have large iron
[411] points that are not poisoned.

2. On their Character

157 In character, the Bushmen differ among themselves just as much as the members of any other people. The various types of disposition already point to this fact. In view of the relatively brief period that I was able to spend with the individual Bushmen, I do not want to give too much significance to individual characteristics. The character of a people, if one can speak of such, [21] manifests itself in the average conventional or traditional kind of reaction in different situations, and, in spite of the physically conditioned differences in character, this kind of reaction nonetheless displays a certain broad uniformity.

Since among the other Bushman tribes my observations
[114] were less detailed, I shall report everything worthwhile that I observed here.

When he is confronted with something new, the Bushman at first acts relatively uninterested. He has little curiosity. On the other hand, two !Kung Bushmen did once demand of me a detailed explanation of the motor, and they listened patiently to my account. When an American once gave a phonograph concert, they listened to it with obvious pleasure, but none of

[21 cont.]

157 them thought of asking a question about it. The Bushmen of
today at least do not believe that any kind of magic is concealed
[177] in the Europeans' machines. They learn to use European instru-
ments fairly quickly; in particular, they soon become familiar
with the rifle. Dornan reported that there was a large number
of improvised rifles that the Bushmen had adapted. In a new
environment, the Bushman is wholly self-possessed and coolly
observant. He is highly adaptable. The girls, of whom a num-
[648] ber are kept by farmers as concubines, are quite skillful at
housekeeping. In Ovamboland they quickly adopt the living
[177] habits and economic activities of the Bantu. An Ongandjera
Bushman acts as an instructor at the teacher's college in Oonipa.
He owns a small kraal that is well-maintained in Ovambo fashion
and, in addition, has built himself a round hut of tiles in which
[648] he keeps his "library." They seldom stay long on the farms, but
[147] probably in the main because the food does not agree with them.
609 The Bushmen are most distrustful of other people. Every armed
person whom they encounter is regarded from the outset as an
enemy. The Bushman is allowed to enter the regions of other tribes
only if he is unarmed. Even along the edge of the farm zone
the mutual distrust is so great that a Bushman who has been sent
to a farm as a messenger dares not leave the road, which is
regarded as a neutral zone, if another kin group has settled in
the vicinity. If two armed Bushmen who are strangers approach
each other, they disarm at first sight before they greet each
other. When a Bushman comes to a village or to a farmhouse,
he will put down his arms at a certain distance and sit down to
wait patiently, if need be for hours, until he is questioned. A
186 distinct sense of race is not apparent. Everything that does not
609 belong to one's own kin group is regarded as strange, even
hostile, except when common persecution causes a sense of
solidarity to spring up among all those who are persecuted. At
the same time, they very clearly possess a kind of sense of
humanity as a whole, that is, they do not believe that they are
the only people, and they are convinced, for example, that the
people of all races are received in the heavenly house. Their
602 conduct toward relatives is regulated by numerous customs, but
in general it is formal and almost ceremonial, even toward the
[593] wife and children. The Bushman is never importunate.
[157]

[21 cont.]

648 The Bushmen as a whole are despised by the other peoples, but in individual cases they are feared, and not least by the Whites. The Bushmen are familiar with this attitude and conduct themselves accordingly.

797 The Bushmen accept a foreign point of view only with
177 great difficulty, if at all. The mission, accordingly, can show no noteworthy success among them. On the other hand, they
157 usually grasp the intentions of others more quickly than the ordinarily more superficial Blacks. Consequently, they give brief and precise answers to the questions put to them. When asked questions that they do not want to answer, they remain silent. At the same time, in dealings with them one should note that they tire very quickly when they have to do mental work, and then they will not answer further questions, not because they do not want to, but because they are too tired.

181 The Bushmen are not generous. Nevertheless, allow-
[574 ing a stranger to partake of a meal, as well as giving him some
609 of the available water, is wholly matter-of-course with them.
[43] They very rarely, however, give any of their personal belongings, weapons, ornaments, hides, and so forth, as presents. If they themselves receive presents, they are obviously delighted.
181 It is true that they do not express their gratitude with words,
577 [22] but anyone who does the Bushmen a kindness may be sure that they will manifest their gratitude by deeds to the point of self-sacrifice.

To help a fellow human being who is in trouble is a moral obligation. There is a report of a prospector who lost his
[648 way in the bush forest and was then saved by the Bushmen, with whom he could not even converse; they took care of him for several days and finally put him on the right path.

Agreements and promises are kept unconditionally by the Bushman, although it is true that he usually arrives a little too late. Once, when an ox from the ox-cart of the Catholic mission had to be left behind on the way to the Okovanggo, it was put in the care of the Bushmen and they were to deliver it at the time of the next full moon. The people kept their word, and the ox was delivered, well-fed, at the specified time.

As a comrade, the Bushman is reliable and faithful (1).

181
648

1. A European had once illegally

/22 cont./

181
648

appropriated a number of little trees and planted them in front of his house. On one occasion when he was in town with his Bushmen, the original owner of the trees declared that in the afternoon he was going to see about it. The Bushmen heard this and disappeared. When the two Whites came to the farm, the little trees had disappeared. The Bushmen had run ahead and had hurriedly removed them on their own initiative.

181 The Bushmen are at all times courageous and steadfast people, characteristics which, indeed, their very way of life would produce.

831 The Bushmen strictly avoid talking about sexual matters
[864] in the presence of women and children. Just as in general they are a people without imagination, they do not have any form of the more subtle erotic phantasies.

The endless obscene stories that one hears from the Blacks as soon as he has gained their confidence are unknown among the Bushmen.

The sexual element is absent in their religious cele-
[535] brations, but it finds expression in many of their dances, which imitate the love play of animals.

834 On the whole, their sense of modesty cannot be denied, even though, naturally, they do not have such decent forms of conduct as the genteel Bantu, among whom it is regarded as extremely improper to look at the breasts of the women. The
[516] girls and women never sit in the typical squatting position, but rather sit on the ground with the legs crossed.

[576] Although the life of the Bushmen within the encampment is openly in view, those principles that we regard as natural tact are nonetheless observed.

[514] The Bushman performs his necessities at all times out of sight of the others, and love scenes are never enacted in public.

114 It is naturally very difficult to learn anything more
124 precise concerning the more intimate details of sexual life

[22 cont.]

114 without compromising oneself. Only old people are suitable
124 informants, since they are no longer eager for renown.

In view of the hard life that the people lead, sexuality,
831 naturally, is not excessively developed. Perverse manipulations are evidently unknown, since my informants did not even understand questions on this subject.

833 Normal sexual intercourse is usually performed in the bush during the time between the evening meal and the rising
271 of the moon. Long periods of thirst result in almost total im-
147 potence.

157 Despite all the formality, they have an unbridled
578 temperament which frequently expresses itself in violent emotional explosions over trivial affairs, which then may easily lead to serious consequences since the poisoned arrow is always at hand. For example, I was told the following story: A Bushman worked on a farm for quite a long time and, with his belly fat from eating maize, came to visit his thin companions. His brother made fun of him for being so fat, saying that he could not run any more, whereupon the fat one retorted: "Just the same, I'll live longer than you." After this brief exchange of words, the scrawny brother stabbed the fat one. -- A film com-
157 pany once wanted to make a film among the !Kung who are
648 settled behind Keibeb; the film was to be called: "When the First Whites Came into the Land." The chief of this horde had a [23] pair of old German military trousers as an emblem of his office and when he was requested to take them off, he responded with the declaration that he would take off his trousers only if the White did the same, whereupon he received a box on the ears that put him and his companions in such a rage that the film company preferred to depart in order to avoid a catastrophe.
157 That they can also be quick at repartee is shown by the following story which was repeatedly told to me by Europeans: A Bushman had been accused of poaching. The magistrate asked him: "Don't you know that these animals belong to the king (royal game)?" The Bushman answered: "I saw no 'brand' (property mark)."

As a chief or family head, the Bushman is bossy and
[593] unyielding, which is understandable in view of the rigidity of his whole conception of life. The sick Bushmen lie silent and

[753] 157 [23 cont.] THE SICK BUSHMEN LIE SILENT AND patient, but a case of illness in a village upsets all its members, partly out of compassion, and partly out of fear of the spirits of sickness. The modes of conduct that I have described already permit certain conclusions concerning the structure of the psychological personality among the Bushmen. It is certainly impossible to compare the mental set of an intellectualized, highly domesticated European with that of these primitive hunters. There is absolutely no difference, however, between the simple European and the natives in their conception of life and their manner of
105 reacting to environmental influences. As I have already explained
182 in another place, we may speak of a law of inertia in cultural development (1). The primitive man is perfectly aware, perhaps

1. V. Lebzelter, "Persönlichkeit und Weltanschauung bei den Eingeborenen Südwestafrikas Jahrbuch der Österreichischen Leogesellschaft, 1932.

instinctively, perhaps by tradition, that the quantity of energy possessed by every individual is limited and that each expenditure of energy means wear on the life machine and, hence, the shortening of life. The individual, therefore, strives to attain, with the least possible expenditure of energy, what to his mind represents an optimal adaptation to the conditions of life, and to maintain this state of adaptation with the least possible expenditure of energy. The great difference between European civilization and many primitive cultures, including that of the Bushmen, lies in the fact that European culture as a whole finds itself in an unstable condition, which makes the attainment of an optimal state of adaptation possible to only a few of its members. Bushman culture, on the other hand, represents an optimal state of adaptation that can be automatically attained by each individual Bushman. In its way, therefore, it is more perfect than ours. No other people and no other race, given the same technical means and the same environmental conditions, could achieve a better adaptation. One can even speak of such an adaptation with respect to the spiritual culture. The life of the Bushman is made secure in this life

[23 cont.]

105 and in the beyond by his traditional conceptions, and the preserva-
182 tion of this adaptation, in the spiritual as well as in the material realm, is achieved by means of a strict selection of all the cultural goods offered from the outside. This selection is consciously carried out. Put briefly: the Bushmen have hitherto refused higher
[177] economic forms not because they do not possess the ability to handle them, but because they did not want to adopt them. If the material preconditions collapse, then they adopt, step by step or all at once, totally different ways of life, as is shown by their Bantuization in Ovamboland and probably also by the formation of the Hottentot people through the adoption of livestock raising on the part of a number of Bushman tribes. Their average intelli-
[153] gence is no less than that of any other race. Every Bushman knows
[184] the entire spiritual heritage of his tribe.

Of the same Bushmen, F. Schinz (2) says:

[113] 2. F. Schinz, Deutsch-Südwestafrika, Leipzig, 1891.

181 "The Bushman is always faithful to his master and will follow him anywhere without pay; one need not worry about leaving him alone at the wagon and will rarely have to reprimand him for dishonesty. All travelers and hunters unanimously praise
[593] the great affection that exists between parents and children, which goes so far that the father or mother will sacrifice themselves in order to save their child. I was told [24] by the hunter L. that at the Okovanggo he once witnessed a scene in which a young Bushman, who was one of the members of the hunting expedition, was in danger of being trampled to death by an angry elephant that stormed toward him. At the last moment when his paralyzed companions had already given the boy up for lost, his father sprang forth and flung his throwing club at the forehead of the enormous animal. The elephant now turned against his new attacher and furiously crushed him under his feet, giving the son the opportunity to flee."

[114] My observations are fully in accord with those of Dornan (1)

[113] 1. Dornan, Pygmies and Bushmen of the Kalahari, London, 1925.

[24 cont.]

181 He states:

181 593 "It has been asserted that the Bushmen have no feeling for one another. I have frequently heard it said that the mothers are cruel to their children and occasionally kill them when their burden becomes too great. As far as I can see, this is untrue. I have frequently seen Bushman mothers kiss their little ones, exactly as European women do, and when the children are ill, they go to all kinds of trouble. The fathers, it is true, are frequently gruff and rough, but never brutal to their children. The girls are usually seen in company with their mothers, the boys with the men. Between mother and daughter there is an intimate relationship of
181 trust. It has also been asserted that Bushmen are ungrateful; this is also quite untrue. They show their feeling of gratitude neither to one another nor to the Whites, but anyone who gains their trust through kindness can tell that they are indeed grateful. They show their gratitude not by words but by deeds. If someone is in need or in distress and a Bushman friend is in the vicinity, the latter will stay by him to the bitter end."

The !Kung Bushman in particular is much more a rational than a sentimental person. The extraordinary difficulty that he encounters in obtaining his livelihood makes him extremely independent in his thinking. It was surprising to see the sureness with
[124] which not only men but women, too, were able to act as interpreters. Whereas among the Bantu it is difficult to keep the conversation on the subject, the Bushman always sticks to the point. Even the tribal traditions, insofar as superstitious conceptions are concerned, are not safe from the skepticism of the individual. For instance, I once asked a number of Bushmen whether they hunt lions. They
[775] answered in the negative, and when I said that this was probably
[771] because the lions harbored the spirits of eminent deceased Bushmen, they laughed and said that this was just a tale of the Hei//om Bushmen and some Bushman doctors who had learned this from them. Other men of the same tribe, on the other hand, were firmly convinced that the spirits of great Bushmen doctors reside in the lions.

181 There are also many stories about bush spirits, especially in
771 the Otjimpolo Veld. My informants repeatedly observed, however, that they did not know whether there was any truth in them, because they had never seen any.

[24 cont.]

000 they had never seen any. A certain dry humor spiced their con-
522 versation. I once said to a Bushman: "If you tell me this, you
161 will get whatever you want." He answered: "Good, I shall speak
157 and you will give me your automobile." Their imagination is
123 very poor; in this respect they are much too accurate as observers of nature. Once a young Bushman woman with two children came to me and wanted to buy some sugar. I said to her: "I won't sell you anything, but you will get the sugar if you tell me some children's stories, for example, about animals." After some hesi-
[538] tation she began the story of Arri, the guinea hen. It was no fairy tale, but a detailed account concerning this important food bird. She even imitated the calls of the guinea hen, "for example, when someone comes and there is danger, then they say, 'gannana he gannana he,' but when they are alone and enjoying themselves, then they go 'gi gi gi.'" The children had to imi-
[861] tate this until they were able to mimic the sound accurately. Then it was the turn of the sand hen, which says, "gi ganna gi ganna"; then the ostrich, which goes, "hmm, hmm, hmm"; then the gum bird [Harzvogel], which says, "hai-dschi, hai-dschi," and the owl, "mhm, m."

3. Posture, Movement, Stamina

516 As a result of his marked lordosis, the Bushman never assumes a posture that would conform to our military ideal; he almost always stands with his stomach somewhat protruding.

481 The way the Bushmen run is very peculiar and would justify detailed study. [25] The run is really a continuous fast walk, in which the legs are kicked forward, but the lower thighs are never brought back high, as is the case with our runners. The body is held as straight as possible, and the head up, not forward (1).

[113] 1. E. v. Eickstedt (Rassenkunde und Rassengeschichte der Menschheit [Ethnology and History of Mankind], p. 556) states: "The foot is put in a peculiar transverse position, which makes the track in the sand easily

[25 cont.]

481 recognizable -- a characteristic that during the old Bushman persecutions cost many thousands of these unfortunate and peculiar hominid creatures their miserable existence. The walk of the Sanides is also peculiar; they do not walk, they prance. Out of habit they always raise their knees and feet as though they were walking among the sharp grasses and thorn bushes of their homeland. This, like the swaying walk of sailors, is of course, a secondary, acquired characteristic, not a racial one."

I prefer, nevertheless, to regard the walk of the Bushmen as somewhat racially conditioned.

516 The sitting position of the Bushman is the squatting position that is practiced by so many primitive peoples and was probably at one time universal among mankind. At the same time, their position differs from that of the Blacks, insofar as the latter usually squat in such a way that the bones of the ischium do not touch the ground, whereas this is the case among the Bushmen. As a result, when they squat, they bend their backs quite far and must spread their legs apart.

513 When sleeping, the Bushman lies rolled up on his right or left side. The children all cuddle up to the mother to sleep.

147 The muscle power of the Bushmen is very weak. The dynamometric measurements that I carried out show that the pushing power of adult men is less than that of European working women; it only amounts to between 30 and 40 kilograms, whereas European women achieve approximately 60 kilograms, men engaged in light work average 80 kilograms, and European heavy workers and the smiths among us reach an average of 120 and more kilograms. Black heavy workers attain an average of only 80 kilograms. Thus, the Black on the average is twice as strong as a Bushman, and the White is three times as strong.

At the same time, there is no essential difference between the sexes among the Bushmen themselves.

[25 cont.]

147 481 Similarly, the strength displayed by the Bushmen in using the bow is by no means impressive. While their momentary efficiency is low, their endurance in marching is great. In 1916 when the farmer Schwarz in Neudesenberg (Keitsas) was sick with black water fever, the farmer's wife sent a Bushman to Grootfontein for a bottle of champagne. The man left in the forenoon and returned around midnight. The distance was at least 100 to 120 kilometers, for the highway, which has few detours, is 90 kilometers long. (Informant: Farmer Schwarz in Duwib.)

4. Physical Types and Constitution

142 The Bushmen are a distinctly human type of savage with very gracile bone structure. A group of them that I designate as South Khoin is the only form of human being adapted to desert life, or in any case is the form best adapted to it.

The type that has developed there can in no way be subsumed in our physical type schema. Since this same type to a considerable degree is also involved in the composition of the northern forest Bushmen, there are naturally a great many individuals whom we cannot classify at all in our sense. At any rate, however, we can -- and here I am anticipating some of my anthropological conclusions -- differentiate among both sexes of the !Kung a longitype and a brachytype. Especially among the women it is almost always possible to differentiate the "chubby youthful form" from the so-called future form.

In another place I have defended the view that the athletic type should be regarded as the true normal-type, and that this type has the innate ability to accumulate a moderate amount of fat. The muscular-respiratory type with a slighter development of the skeleton and musculature does not possess the ability for a great accumulation of fat, whereas the digestive type with slightly developed musculature has a great ability to accumulate fat.

[26] From the athletic type a continuous series leads through the respiratory and digestive forms to the tall-asthenic and short-asthenic types and from there to the decided weaklings.

[26 cont.]

142 The athletic type thus represents the best realization of the human type among the races.

Since, from the day of conception on, environmental influences are predominantly of a harmful nature, the average type finally arrived at is the type formed by the average harmful effects, which, on the one hand, are of a hereditary and constitutional nature, and, on the other hand, are conditional effects during the individual's lifetime. The more unfavorable the living conditions are, the greater will be the harmful effect coefficient, and the more the average physical type will approach the asthenic. Only environmental improvement, brought about by high civilization, permits athletic forms to develop in considerable numbers.

According to our schema, we may designate the Bushmen as asthenic on the average, and the best developed among them as respiratory. In the case of many male individuals, there is an [146] ability for considerable fat accumulation, and on the farms I encountered a number of Bushmen who had adapted themselves to a flour diet and had considerable body weight.

The digestive type thus certainly does occur among them, [146] even though we must keep in mind that the diet, which is rich in meat and poor in carbohydrates, counteracts its development.

5. The Course of the Day

805 The !Kung Bushmen divide the 24 hour day into seven seg-
[192] ments, which are:

/gam χ'ǎ-o-a, dawn.
/gam do di /gii, time of sunrise.
!nai /kho, (the sun) is in the middle.
ha ti ≠náu, (the sun) will go down.
χ'ǎ-o ti ≠náu, the sun is now asleep.
/gu gǎ djo-o, one can no longer see the people because it is dark.
!a ds ĩ, midnight.

512 The division of the day varies somewhat with the season of the year. With the exception of the so-called hot season,

[26 cont.]

512 from about August 20th to the end of December, the following daily routine is normally observed. Before dawn, it becomes very cold, the people wake up, and the boys stir up the fire and put on it the remains of the evening meal. The old people move closer to the fire and go on sleeping until the sun comes up. Then they have their breakfast, which consists of the remains of the [462] evening meal. The able men now go hunting. The women continue to sit around the fire for awhile and nurse their children. [462] At about 10 o'clock the women and children, as well as the girls, go out in a group to look for veldkost. Almost every woman [482] old enough to bear children carries a child on her back, while a second child often rides on her shoulders. The smaller boys stay at home and help the old people, who get up about an hour later [361] to fetch water. The huts are never located close to the water: 1. because people get sick close to the water; 2. because the lions come there; 3. because the game would be frightened away. The watering place itself is visited quite irregularly, because in disturbed times the enemy lurks there, and occasionally also the police. The male and female doctors go into the bush, usually not very far, alone or only with a disciple, to gather medicine. Around four o'clock in the afternoon the women come back and begin to cook. Around this time, too, the men begin to return with the spoils of the hunt. When the sun goes down, [264] they all sit by the fire and eat. Each family has its own fire. Then some will continue to chat for awhile, while others go to sleep, and gradually it becomes quiet.

[264] They do not eat at noon. From eleven to four o'clock the camp is deserted, and even the old people sleep somewhere in the forest. The hunters and the women collecting veldkost also [27] take a long midday rest during the hot afternoon hours. During the hot season, on the other hand, they set out soon after midnight to hunt and search for veldkost, because later in the day the sand is too hot to walk on.

6. The Divisions of the Year

805 The Bushmen reckon time according to full moons, for example, agreeing to meet after three or four full moons, and

[27 cont.]

805 the like, but they have only ten months. They name them after terrestrial phenomena.

!Kai dsáa	It is cold (winter)	June
gama /ēi	The grass burns	July-August
!hoá sori	It is hot	September-October
!u shē	The rain begins	November
≠khŏ shē	The trees bloom	December
/hō //gāi	It is raining	January
!Khan //gai	The veldkost is coming up	February
!nâ -mâ	The veldkost is ripe	March
ao rē //kum //kā	The rain is stopping	April
!hoá //gai	The year is at an end	May

They reckon also from harvest to harvest.

221 The most beautiful time in the life of the Bushman is March and April. Even those who live on the farms hurry into the wilderness at that time. At certain places where there are many fruit trees, such as the marula, the friendly kin groups gather from far and wide. Here the young men look for brides, and there is much dancing, because at this time the women are not tired from seeking veldkost which is now to be found everywhere. Hunting yields less at this time, since the game has water and pasture everywhere.

Soon, however, the leaves fall, the bush forest becomes red and yellow, the migratory birds fly northward, and then the first cold nights set in. Now the "Dsao" (spirits of sickness) come and (753) bring sickness to the chest. At the end of May and the beginning of July [sic] the first frosts set in. Now the Bushmen move to the watering places, which stay open for a long time. The nights now (374) become torture. Burns on the skin of the chest and abdomen oc- (513) cur frequently, because the Bushmen now lie very close to the fire to sleep. Around this time, some of the kin groups already begin to suffer distress, because the game moves to other regions where there is still some pasture. In July the grass is finally dry (224) enough so that it can be set afire. Now the entire steppe burns. The young grass again attracts the game; hunting improves. The hot season is the worst period; the resting places of the game are quite uncertain, veldkost becomes increasingly scant, and the

[27 cont.]

221 Bushmen shrink to miserable skeletons. Many of them at this
[648] time! run to the Blacks or Whites in order to earn something. In
[731] dry years no attention is paid to the kin group boundaries. All
[423] gather around the few water holes that are still open. As soon as the rain begins, conditions start to improve; the people start moving out in various directions, not to meet again until several months later at the time of the veldkost harvest here and there.

7. The Course of Life

584 I shall render in literal translation the account that my informant gave of the way a young man courts a girl:

If a young man wants to marry a girl, he must first speak to her and say: "I love you and want to marry you." If the girl is willing, she says first: "You must wait." Then she goes to her parents and asks them whether they have heard that the boy has spoken to her. The parents then ask whether the girl wants to marry the man. [28] If the girl says, "Yes," then the parents say, "He wants you; he has seen that you are good and hard-working; you may marry." If, however, the young man has thought the matter over and takes back his words, the girl goes to her parents once more, and the boy to his. The latter say: "You wanted it this way; nothing can be done about it." In case the girl definitely gives her consent, however, the young man brings all kinds of little presents and gives them to his future bride, who takes them to her parents. The parents-in-law must now in turn give presents. With the exchange of presents, the
[583] marriage is regarded as legally concluded.

[114] The hunting test described by Passarge (1) and others is not
224
584
[113]

1. Passarge, Die Buschmänner der Kalahari, 1907.

the rule. Some vain girls demand it, and sometimes young men will voluntarily go through with it in order to beat his rivals. This hunting test is carried out in the following manner. The boy goes hunting without weapons and pursues the game (as a rule,

1 [i.e. The hot season -- Analyst]

[28 cont.]

224 a gemsbok) until it is tired and then drives it to the vicinity of
584 the hut of his intended. The pursuit of such a large antelope is not as difficult as it looks, for these ruminants are seized with serious cramps if they are not given time to settle down to ruminate. In other words, the pursuit of such a large antelope simply involves continually disturbing the animal for a long period of time. Then the young man calls to the people and asks them for weapons. All of them leap up, and the girl, too, stands up and watches as her people run with the spears. The hunter kills the game before her eyes. Then they bring the meat and cook it, and the girl says: "That is a courageous hunter; I want to marry
584 him." It is not unusual, however, for a young man to marry far away from his relatives, without having asked for the consent of his parents. In that case, the young woman must stay with her parents while the husband returns home and reports the marriage to his parents. The latter say: "How can you do this, when we don't know whether it will turn out all right?" The husband, however, says: "I have already done it, and I am merely telling you." Thereupon the parents answer: "Well, it's all right."
[591] Then the husband returns to his young wife, or to her kin group and brings his wife and child to his own kin group, where they are received. According to Vedder (Tsumeb), the young man sends a messenger with a piece of game to the father of the girl of his choice. If the father accepts the game, the betrothal is regarded
583 as concluded. As soon as the youth moves to the encampment of
591 his father-in-law, the marriage is regarded as concluded. He
[585] must work for a year for his father-in-law and deliver all hunting spoils to him, but he may not enter the hut of his parents-in-law. Once the first child is born, he moves with wife and child to his kin group.

585 Von Zastrow and Vedder (2) report on the conclusion of a
535

[113] 2. Von Zastrow and Vedder, "Die Buschmänner," p. 417, in Schultze-Ewarth, Das Eingeborenenrecht, Vol. II.

marriage:

"There is much dancing. The animal dances have a pervasive erotic element. In one of the first dances the bridegroom

[28 cont.]

535 makes his appearance as the bull of some animal species that the
585 two kin groups especially prize. He takes his place in the row of dancing men. Across from them the women have taken up their position in a long row and accompany the dance by stamping, singing, and clapping their hands. The bride stands among them. She is in no way distinguished from the other women and girls. After a few turns, the bridegroom steps out of the row of men, goes dancing toward the bride, seizes her, and dances back again. The bride then comes from the row of women, clapping her hands, stamping, and singing as she moves toward the bridegroom; without touching him, she turns back, keeping her face turned toward the bridegroom, and rejoins the row of female dancers. With this, the external formality of concluding the marriage in front of many witnesses is over.

583 "It is the young man's duty, however, to leave his paternal
591 kin group for a year and to work for his parents-in-law. This means that any spoils he gets from hunting must be left in his mother-in-law's hut. He, of course, gets his piece during the distribution of the meat, but he is not yet regarded as the actual provider for his young wife, who, as before, receives her share of the meat from her mother, although she searches for veldkost for herself and her husband.

(224) "As a hunter, the man eats only the flesh of the rump.
262 The women and children receive the legs and intestines. Children are not allowed to eat certain parts; for example, a child may
(825) not eat the heart of a jackal. The child would not become sick
(828) by doing so, but since the jackal is very cowardly, the child would also become cowardly.

591 [29] "After the first year of marriage with its obligatory service, the young wife follows her husband to the encampment where the man's father or his kin group resides.

845 "If the child is so weak that it probably will not live,
847 or if it has a physical defect, it is buried alive on the same day, with or without the consent of the father and mother.

553 "The name of the child is given by the father. This is
852 done a few days after birth. The father spits on the child's chest and calls it by name. Others sprinkle it with water from a well.

[29 cont.]

553 The custom of spitting is undoubtedly original, not a substitute
852 for well water."

551 The father gives his newborn child a name. The boys usually receive animal names, commonly that of the grandfather, and the girls, plant names. Albinos are unknown among the !Kung
[142] tribes visited by me, but a horde of Bushmen with red eyes is supposed to live in the eastern Sand Veld in the region of the
[845] Dussidum. I have never seen twins; they are probably done away
853 with. The children are breast fed for a long time; older infants learn to squeeze the milk out of the breast with their fingers or pull with their teeth on the leathery nipples. The assertion of
847 other travelers that the women kill their children if they are born
[114] before the previous child has been weaned is allegedly not true of the kin groups visited by me. On the other hand, Vedder (1)

[113] 1. "Zur Vorgeschichte der eingeborenen Völkerschaften von Südwestafrika. I. Die Buschmänner [On the Prehistory of the Native Tribes of Southwest Africa]," by V. Vedder, Journal of the South West Africa Scientific Society, Vol. I, p. 10, 1925-1926, Windhoek, 1927. -- Cf. also Von Zastrow and H. Vedder, op. cit., p. 414.

reports:

"I must mention one other custom which likewise considerably contributes, and may have contributed in prehistoric times, to the Bushmen being so few in number. Custom demands that a child born when the older child of the same mother is not yet three years old be buried alive. This is a gruesome custom. I spoke about it with a racially pure Bushman. My remonstrances did not convince him at all. He explained: 'We Bushmen are poor people. We have no goats and no cows to give our children milk. If the woman brings two children into the world within a period of three years, we don't know what the older child is supposed to live on if the newborn child uses up the mother's milk. It cannot live on the hard veldkost or on tough meat. The teeth are not yet strong enough. If we let the newborn

[29 cont.]

847 child live, the older child would have to die. We are left with the choice of killing one of the children so that one can stay alive.' The explanation is absolutely convincing. There is the [593] added consideration that the Bushman mothers lose their maternal instincts when they see that a child is not thriving. I saw a six-month-old Bushman child, a really pitiful figure. The mother did not have sufficient food for her child. My wife offered to give the child the bottle. The proposal was joyfully accepted. For a few days, the child was brought at the specified times. It gladly took the bottle. But then the mother felt that her freedom was restricted. After all, she had to remain in the vicinity of the house for the sake of the child. She did not lack food at all. I provided for her. The desire for veldkost was too great, however, and the child was brought only in the morning and evening and received his meal. Naturally, no noticeable improvement could be observed. Hence, at an opportune occasion the mother disappeared, and when she reappeared, she was without the child. She and her friends had buried it alive."

853 Matters are certainly not always as hopeless as Vedder describes them. First of all, at a very early age the children are given pre-chewed veldkost, and, secondly, the women of the kin group help one another out with the breast feeding. During 854 the day the infant stays in a hide sack on the mother's back, and at night the children sleep at the mother's breast; the smallest lies directly at the breast, while during the cold season the others cuddle around the mother's legs. From earliest childhood, the 867 children are taught to honor the old people and not to take anything away from anyone. For the boys, the father soon carves a bow and arrow, for the girls a little digging stick. Nothing is said to little children when they take things, but once the boy has been given a bow, he may not touch anyone else's bow and arrow; otherwise he gets a beating. The boys greatly fear the women. 868 The bigger boys stay together by themselves and go hunting for 857 small game or accompany adults on the hunt for large game.

586 Marriage is absolutely indissoluble. Separation is also impossible, for outside the kin group the woman would perish in the wilderness. So far as I have observed, the relationship between 593 marriage partners is in general very good, and not uncommonly the

[29 cont.]

.593 men are strongly influenced by their wives. It practically never
[562] happens that a man beats his wife. Monogamy [30] is the rule.
595 I know of one single case of a man having two sisters as wives. It is true that certain marriage laws frequently force the men to marry considerably older girls. It is therefore understandable that in such circumstances the desire for a younger life's companion frequently arises, but the consent of the first wife is absolutely necessary. It is said: "He who has a good wife may have several; he who has a bad one must be content with her alone." The Bush-
842 men do not know any means of preventing pregnancy, and, accordingly, very soon after marriage the young wife will find herself
843 with child. The husband and his sisters-in-law must see to it that she eats no sour veld fruit, nothing sweet, and no fat meat. No one is allowed to walk behind the pregnant woman's back; no pot is supposed to be put on the fire until the woman has been rubbed with the soot of the pot; she is not supposed to sit where the other
844 people are, but must stay to one side. When the time for delivery approaches, she must step over the legs of her husband, who has rubbed medicine into incisions in his calves. When the woman feels that the birth pangs are beginning, she goes into the bush by herself and looks for veldkost. She is not supposed to sit down while doing so, because that would have harmful effects on the birth. Then she picks grass, prepares a place under a tree, puts her bag of veldkost to one side, and gives birth to the child in a squatting position, grasping a branch with her hands. Then she takes the child, severs the umbilical cord herself, puts it in her veldkost bag, and goes home with it. The cord is always severed with a quartz knife (as among the Dama). The umbilical cord (!nm) is buried. Only women who are unafraid and who have already given birth to one child follow this procedure. A woman who is giving birth for the first time and is afraid does not go into the veld, but stays at home. As soon as the pains begin, she weeps and goes out, sits down, and stands up again. Older women of the kin group accompany her, and in their presence the child is finally born inside the hut. The men may not be present. Children, too, may not look on, and if they creep up out of curiosity, they are soundly thrashed.
[845] If there are difficulties, the abdomen is massaged. Von Zastrow
002

[30 cont.] VON ZASTROW
113 and Vedder (1) report further:

1. Von Zastrow and Vedder, Die Buschmänner, pp. 412-413.

843 "It is absolutely against the rules to do anything by word or
754 deed to the pregnant woman that might make her angry. Her evil eye in this period is especially dangerous; her angry word or her curse has an even worse effect. Sores, illness, protracted suffering, and death are the consequences of the evil eye or the curse of a pregnant woman.

844 "It is customary to sever the umbilical cord with an instrument only when the blood no longer pulsates. The umbilical cord is not tied off. The afterbirth must be carefully and secretly buried. The life of the child would be greatly endangered if an animal found it or if a feared sorcerer could appropriate a piece of it."

881 As soon as the girls have their first menstruation (/n) (2),

2. Female genitalia (/n-i).

a celebration takes place, but in this tribe I was unable to learn any of the details. On this occasion, the women dance, clap their hands, and sing, "giriri, giriri, giriri, uhu, giriri uhu," and so forth.

Men may not be present at this celebration. In a Hei//om horde neighboring the !Kung, spirits are appealed to in all directions on the occasion of this celebration, so that the girl, as an adult, will find veldkost everywhere.

The existence of a true initiation for boys is denied (3).

[114] 3. On this point I was either misunderstood
[124] or told a falsehood.

There is merely a kind of testing; an older man goes with the candidate or candidates on a hunting expedition. Under the supervision of the older person, the candidate must kill a specimen of large game. The animal is then brought to the sacred fire, at which the

[30 cont.]

881 old people are seated. The young man may not eat any of the meat; he may only drink the soup, which is also rubbed on him. From now on he is regarded as an adult, a marriageable man;
582 584 his parents ask him whether he wants to be married. The boy commonly replies: "I am still weak and do not know whether I can take good care of her." Then the parents allow him to wait until he himself wants to marry. Von Zastrow and Vedder (p. 415) report the following concerning the boys' initiation:

881 [31] "On this occasion the boys are told how they must conduct themselves when they go out to seek a wife, and how they [867] must behave towards a mother-in-law. To sit down by an evening [584] fire next to an adult girl is tantamount to a marriage proposal, even if not a word is spoken. Under no circumstances may one [606] look at the mother-in-law. They also practice animal dances in the bush, the kind that are performed by the men later at joyous celebrations, and also in times of distress. Finally, the young [304] Bushman receives the tribal marking, a number of skin incisions on the cheek below the temple. Each tribe has a certain number of skin incisions. In order to make them stand out clearly even [386] after healing, pulverized charcoal is put into the incisions. As a result, the tribal marking later looks like a black streak on the yellow skin.

224 "There is nothing against applying another mark on the
304 future huntsman during this celebration, namely, the hunting
881 inoculation. This must be done by a man who has special powers and knowledge at his disposal. In order to sharpen the future hunter's eye for game generally and certain game in particular, it is necessary to make a deep incision between the eyes over the root of the nose, into which the practiced hand of the surgeon sprinkles a powder of dried and pulverized parts of all kinds of game.

"The inoculation may later be repeated several times if the hunter has no luck in hunting.

881 "A person who has received the tribal marking is now re-
884 garded as a Bush 'man'; he can make his own bow and arrows, like those of the old people, and go hunting with them. Also, the way is now open for him to found a family."

582 It practically never happens that a Bushman remains

[31 cont.]

582 unmarried. Marriage is concluded at an early age. The age that
165 Bushmen attain is not great. There are relatively few old people among them, although some of them, it is true, attain a very
593 high age. The children must obey their parents even when they are grown up and married.

888 The Bushmen indignantly denied that they kill the old people or expose them in the bush. If someone is old, weak, or ill, then they simply walk more slowly or leave the sick person behind with a companion. My informants did report to me that dur-
[731] ing periods of extreme thirst not only old people, but also women and children who were unable to move on were left behind. This happened only in desperate circumstances, when those who were half-dead from thirst could not be helped in any case and a stay would have resulted in death for the whole kin group. As soon
764 as someone has died, all the women and girls sit around the corpse and weep. There is no singing on this occasion. Then some of the men go and dig a grave in the bush, cut off medium-sized pieces of wood, and place these in the bottom of the grave as a foundation, over which is spread the hay that the deceased was lying on. Then all take the body to the grave and bury it in a crouched position with the back toward the sunrise. Every relative must give a few glass beads and ornaments if the deceased is a woman. This finery is placed around the neck of the deceased. The corpse is rubbed down with green aromatic powder and ocher and is wrapped in its hides and blankets. They either throw thorn on the covered grave or make a four-cornered gutter in the sand around the grave and posts are pounded into the gutter to make a fence. The grave is now in the center of the fence, like the living person in the center of his hut. A cup of water and some food are put near the head area. Deceased men have bows, arrows, and their hunting bag placed on the chest. Children are given their miniature bows. The Bushmen say that they give the bows and arrows not because the deceased needs them for hunting in the beyond, but because they do not want to use the effects of the deceased, whom they loved. According to Vedder (1), the dead

1. Von Zastrow and Vedder, Die Bushleute, pp. 420-421.

[31 cont.]

764 of the Bushmen are tied up in a crouched position and buried under termite hills.

"The corpse is usually lowered in such a way that it is received by a man standing in the grave. Aside from those who bring the corpse and dig the grave, no one goes to the interment. The corpse is buried either in a crouched posture or lying in a crouched position. In the case of the crouched posture, the face is eastward, and the elbows rest on the knees, while the hands are on either side of the head. In the case of the crouched position, the corpse is placed on the left side. The left hand is placed under the head, giving the appearance of a sleeping person. The face likewise looks toward the east.

766 [32] "Before their interment, feared men, such as sorcerers who had a malign influence and others who were feared in life, but not women, are firmly tied up with thongs of game hide in the crouched posture described above; then, in some cases, the spine is crushed with a stone or ax, as a result of which the head can be bent even lower and placed between the knees. Tied up in this fashion, they are thrown into a fissure in the earth, into an anteater's hole, or into a small cave."

8. The Hunt

423 It is well known that wherever the Bushmen live more or
224 less undisturbed, each kin group has its precisely defined hunting
[621] territory. Vedder believes that the engravings of game tracks indicate old boundaries, as do the stone heaps which are usually designated as Heiseb graves. In any case the question arises as to who actually established these boundaries. My informants stated unanimously that the division stems from the time when the Bushmen still had a supreme chief. There seems to be some authority, however, even today, since in the bush veld the boundary lines are drawn with reference to certain trees, which, in general do not have too long a life. The Bushmen move back and forth within their hunting territories. It sometimes happens that a young hunter is not thoroughly familiar with the boundaries or that wounded game crosses the boundary. In this case the hunter must

[32 cont.]

224 423 go to the kin group to whom this territory belongs and take the men to the animal. Then it will be carefully divided down the middle; the hunter gets one half, and the owners get the other half. Nevertheless, quarrels are common, because there is only one of certain organs, such as the heart, liver, etc. These con-
[184] ditions, however, exist only among the eastern !Kung. A Hei//om or a northern !Kung who is found hunting in the territory
224 of another tribe is regarded as an enemy. Boys' hunting is con-
[857] fined to lizards, tree rats, and other rodents. They ordinarily
[411] use the bird arrow, which is carved out of a piece of wood, but in contrast to the Ovambo, the older boys here already have
[223] poisoned arrows. Young and old pursue the hunting of birds with great enthusiasm; in particular guinea fowl, sand hens, grouse, and the Pau [?] insofar as it occurs in this region. These fowl
[262] and small bushbucks are the chief sources of the meat in the
[136] native diet. The forest region of the eastern !Kung is poor in large game. Zebras are almost entirely absent, as is the wildebeest; the giraffe is very rare. The eland, kudu, hartebeest, and especially the gemsbok are relatively more common. Hunting drives are organized to hunt the elephant or rhinoceros. First, the elephant is separated from the herd. As soon as it has been cornered, one Bushman after another springs forward and throws his spear. It is also possible to hunt the elephant with poisoned arrows; there is a number of thinner spots in the skin at the front legs, and the marksman places as many arrows there as possible. The elephant does not die; it merely becomes sick. The hunter rushes home to get some other men, who then go to look for the elephant with spears. Pitfalls are made in the vicinity of the watering places, and a pointed pole is placed inside them. The Bushmen along the Okovanggo also hunt the hippopotamus with pitfalls. The eastern !Kung maintain that in ancient times the hippopotamus was also found in their land. The sling trap is made
[223] in various sizes. The ostrich in particular is usually caught in such sling traps, which are provided with a piece of bone bleached by the sun. Small cats and the like are also caught with this trap. It is likewise placed on the trails of the bushbuck. Jackals and the like are caught by lying in wait for them as they come out of their dens and then beating them to death with the kirri.

[32 cont.]

222 Termites are captured in two ways. During the night holes are dug near the tall termite hills, and these holes are illuminated with wooden torches. A hide is placed on the floor of the hole, and soon so many termites are on it that the hide can be carried home. The second method is used to catch those termites that have no structures above ground, but have a network of corridors running horizontally immediately below the surface. A hole is dug deeper than the corridors, and the termites fall into it as they run frightened back and forth on their [33] horizontal paths. [821] This kind of termite serves as a weather prophet for the rain [787] doctor, since they construct the most openings facing upward when 224 a rainy year is in prospect. The lion was not hunted. In olden 262 times, only the old people ate the large game. The flesh of predatory animals is forbidden to all children; on the other hand, there is no prohibition against eating hare.

224 Naturally, the Bushmen are very anxious to have success in hunting. !Khu himself, the great captain, brings luck in hunting. He orders the supreme //Gauab (/Nawa) to direct the arrow. The doctors always pray to the great captain to send hunting luck, but there is no specific formula. They do this "quietly to themselves." An old prospector in Kalkfeld told me that he had seen the following among the !Kung Bushmen: "Before they go hunting, they draw the outline of the animal in the sand and with all kinds of ceremonies they shoot an arrow into the drawing. Where the figure is hit, the game will also be struck."

I shall now render fairly literally the course of a kudu hunt as it was described to me by a Bushman: "When I have found a kudu track, then we follow it very quietly and when we have found the place where the kudu ate, then one must be very careful. One person goes ahead, and the others follow. Now, when I see the kudu standing, I take out the poisoned arrow and shoot. Then I look to see what the kudu is doing or shoot once more; then I follow him to see whether the arrow will drop out; if the arrow falls out, I take it and see how deeply it penetrated into the kudu. Then I have to go back to the other hunters and state exactly how everything was. Then we go home. One should not run after the kudu, but must leave it alone. The person who

[33 cont.]

224 has done the shooting must go home immediately and may not speak, eat, or drink, for if the hunter speaks with others, the kudu will not be found for a long time, and if he drinks water, the poison will become watery and will not be effective, and if he eats, the kudu will remain quiet and the poison will not work effectively. The next morning very early we must set out on the trail. The kudu is already dead. The people carry the meat home. [782] Then it is put on the socha [sacred] fire. The //Gauab must be given some of the meat. Whoever does not do this will be punished by the //Gauab with serious illness, and the people will say: 'That is just. The //Gauab has given him the game, why does he give nothing for //Gauab?'" Here, therefore, a true primitial offering is involved.

It is interesting that the Ogowe bury arrows in the sand at various watering places, with the poisoned tip pointing upward; they do this in shady spots that game animals like to use as resting [202] places, and by certain signs, such as tying together blades of tall grass and the like, they set up warnings (Von Zastrow and Vedder).

When a Bushman horde of today is able to hunt down half a dozen large antelopes in a year, it can consider itself lucky.

The porcupine is also commonly hunted, as are the scaly anteater and the fat aardvark, which is very common but difficult to catch. Monkeys are very rare; on the other hand, tree rats make a desirable addition to the diet. The ostrich is not uncommon in open terrain, and ostrich eggs are greatly coveted. Occasionally a boa constrictor, which tastes like a fat fish, or an iguana may round out the menu.

136 Among the animals which are in any way dangerous to human beings, the lion should be mentioned in particular. They occur in great numbers, but rarely stay in one place for a long [165] period of time. A considerable number of Bushmen become their 262 victims, especially in the north. Lions, leopards, hyenas, and jackals are neither hunted nor eaten; the same is true concerning [753] birds of prey. Eating leopard meat produces fever and eczema, [825] while eating the flesh of birds of prey produces temporary blindness and symptoms of sickness similar to acute sausage poisoning.

Poisonous snakes are not eaten; they are much rarer here than in the stony regions of the central and southern areas, and they do not constitute a noteworthy danger.

[33 cont.]

136 Among the dangerous insects, the anopheles mosquito naturally comes first. It is present in enormous numbers during the [34] rainy season. In some places, small reddish-brown ticks are common. The Glossina [tsetse fly] seems to be absent; I encountered them only in the Kunene swamps. Among human parasites, bugs and fleas are practically unknown; on the other hand, lice are extraordinarily common, without being especially noticed by their owners.

9. The Water Supply

312 During the dry season, the water supply plays a decisive role. Every Bushman carries in his quiver the two reed tubes for the so-called Bushman well. It is by no means true, however, that the Bushmen are able to obtain water in this way at any time and place. It is only in places where some dampness is still visible [Fig. 1 appears here] that the earth is loosened with a digging stick, and then the reed, which, by inserting the parts into each other, may be over a meter long, is sunk into the ground. As the accompanying figure shows, the Bushman does not keep the drainage reed and the sucking reed in his mouth simultaneously. The representations which suggest this might well be completely false; instead, the Bushman has the sucking reed in the right-hand corner of his mouth, and as soon as he has his mouth full of water he lets it flow into the closed hollow of his left hand in which the drainage reed is placed. The water gained in this way is of course thoroughly mixed with saliva. It cannot be kept for any length of time.

312 824 Water reservoirs are also provided by the few baobab trees, which contain puddles of water in their interiors. An artful method is used in the Sand Veld. A palm tree is drilled halfway up its trunk; then the palm pith is scraped out as far as possible, and the opening is carefully sealed. The water rising from the roots gathers in this hollow and has a good taste.

Among the thirst-quenching roots, that of a liana (!góa) was named in particular.

[34 cont.]

312 Concerning other water-containing trees, F. Seiner re-
824 ports:

"The water-containing trees always have two or more trunks, and the source of the water is to be sought up where the branches fork. If the saddle formed where the branches separate shows a hole, a hollow area is traced in the adjoining part of the trunk, which may contain up to 60 liters of water. The water is obtained by tying, Bushman fashion, a small bundle of dry grass, or better still, a handkerchief, to the tip of a stick and inserting it in the hollow. When the stick is drawn out, the water drips

Fig. 1. !Kung at a Bushman Well.

from the saturated bundle or cloth, which is pressed out over a cup. [Fig. 2 appears here.]

[35] "The most important water roots are the Asclepiadacea Fockea damarana Schltr. (ehoe), the Leguminosa

[532]
[224]

Fig. 2. //Gauab drives the game toward the hunters (from
[113] Kühn and Obermann, Buschmannkunst [Bushman Art]).

[35 cont.]

312 824 Dolichos seineri Harms (eona), and the Convolvulacea Ipomoea seineri Pilger (eawa); the enormous tubers of the latter two may weigh up to 150 kilograms. Considerably more important for the natives than these 'water roots' is the Curcurbitacea Citrullus naudinianus Hook. (orura of the Herero; gab of the Hottentot); without their juicy gourds, which occur in great quantities and for the most part are edible, most of the central Kalahari would be impassable during the dry season, even for the Bushmen."

Further, F. Galton (1) reports:

[113] 1. F. Galton, Tropisches Südafrika, p. 101.

312 825 "In practice, the first hopeful sign when people are looking around for water is a flight of guinea fowl; next, following the habits of the land, each tree is carefully examined until a parrot is sighted, an object visible even at a great distance because the bird likes to sit on the uppermost branches. A parrot is rarely more than half an hour away from water, and the same applies to baboons. If one proceeds with careful observation and takes a probable direction, he will see doves flying about; then little birds are found in all the bushes, and they are close to it."

10. The Veldkost

222 776 Just as //Gauab accompanies the hunter on the chase, he is also the companion of the women who go to look for veldkost. If //Gauab takes delight in a woman, he will break the bones of an animal, killing it, and will lead the woman to it. If, however, //Gauab is angry at a woman and she finds no veldkost, then she becomes angry, gets up early in the morning, abuses //Gauab, and then takes medicine and washes her face so that //Gauab will not recognize her. Then she goes into the veld and finds something. [782] //Gauab receives no offerings from the veldkost. The celebration 222 of the first fruits of the veld described by Vedder is no longer held. [887] The oldest woman is brought to eat samples of each type of veldkost that is brought home for the first time in the year. Then the second oldest woman takes a taste, and so on down the line.

[35 cont.]

222 When all the old women have made their tests, then the children also get some, and the veldkost is, so to speak, made available for general consumption. When a woman has found a spot where
[423] there is a great deal of veldkost, she makes a sign at this spot, and then everything growing there belongs to her. No one will take any of it.

[262] There were and still are a whole assortment of types of
[888] socha veldkost reserved for the old people. [Fig. 3 appears here.]

11. Ergology

Fire

372 The Bushmen believe that there was a time when they had
773 no fire. The following legend tells how they obtained it: "The ostrich had a firebrand under his wing. He, the owl, and Heiseb played together. Then the ostrich took fright at the owl because he thought the owl had horns. He advised all of them to sleep for a little while. When the owl was asleep, he blew at it and saw that it merely had little tufts of feathers and no horns on its head. Thereupon he awakened the two others again and invited them to go on playing. Then Heiseb said: 'Dear ostrich, please wave your wings.' The ostrich did so, and as a result its firebrand fell to the ground. Heiseb picked it up and threw it to the fig tree, and since then man has had fire." -- The narrative probably comes from the legend-circle of the Hei//om Hottentot. Otherwise, Heiseb never appears in !Kung stories. Two pieces of wood from the
372 fig tree are still used occasionally to make fire. For the most part, the most popular devices for making fire are a striking iron and flint; matches are less [36] prized. A pair of fire sticks, the sucking reeds, a few poisoned arrows, and a bird arrow make up the permanent inventory of the quiver.

[36 cont.]

Dwellings

342 The dwelling of the Bushman consists of the simple windscreen, semicircular in form and about 150 centimeters high. On [177] several farms, however, even the Bushmen have taken to building beehive huts in the Herero manner. The windscreens in a settle- [361] ment more or less form a circle, and the socha fire is to be found [378] near the windscreen of the village chief. During warm nights the [372] Bushmen do not sleep under the windscreen but outside it. [513]

372

Fig. 3. Sticks for Firemaking, Kalahari Bushmen (Museum of Ethnology, Lurich).

[36 cont.]

Cooking and Cooking Utensils

354 Lumps of surface limestone are generally used as hearthstones.
412 Here and there, as a great rarity, one finds a pounding stone of quartzite.

To pound the veldkost, small mortars, carved out of wood, with conical or hemispherical bottoms are used. In case the mortars become damaged, holes are made on either side of the crack, and the flaw is drawn together with bast strips and also smeared over with resin. The shape of the pestle, which is from 50 centimeters to one meter long, is shown in Figure 7.

415 Originally these !Kung had no pots and probably had no
[352] way of boiling anything. The usual manner of preparing food even today is to roast and grill it on and between hot stones. Nowadays,
[439] every horde owns a number of pots acquired from the Okawango.
[482] These pots have bast or tendon plaiting around them, by which they are fastened when carried on the march. The Okawango people
[439] gladly exchange these water pots, which they have carried with them on the waterless stretch, for food from the Bushmen in the area between Karakowisa and Nuragas.

416 Small cast-iron tripods are a very popular article. A
417 longish, crudely carved stirring stick, as well as a piece of hardwood for arranging the fire, completes the inventory of the Bushman kitchen. Spoons are unknown.

Clothing

291 The clothing of the woman, as has already been repeatedly described, consists of a front apron and a back apron, made of soft leather, and a leather cloak something like a pelerine. Usually she also has a carrying hide for the baby. Generally, the child does
[854] not sit on her back, as among the Blacks, but on the side of her hip.
[415] In addition, the woman has the large veld bag in which she keeps the
[412] finds from her collecting. On the march, the woman is equipped with the simple digging stick, pointed at the bottom.

The men are clothed only with the modesty apron and in addition

[36 cont.]

291 wear the short hide pelerine with which they cover themselves when sleeping. In thorny terrain they frequently wear sandals made of eland leather, as well as leather leggings. Whereas the woman always go around bareheaded, the men frequently have some sort of head covering, sometimes round hide caps and sometimes pointed little hide hats and homemade straw hats. On the 293 upper arm they wear a tight fitting leather ring, to which is attached a small bag with the most important utensils, that is, tinder, pipe, tobacco, some money, and last but not least, within the police zone, the pass.

177 They do not want European blankets. They catch fire 291 too easily, become saturated with water during the rainy season, are more difficult to carry, and are a breeding place for lice. On the other hand, cotton cloth and shirts are very popular. My re- [123] search with a horde always ended with all the informants having [124] been supplied with ready-made clothing. On the first day, the informant receives a shirt, on the second, a colorful loincloth, then a head cloth, tinder, tobacco, some white money, and then he becomes ill and disappears, and another or others come to be supplied. [37] [Figs. 4-8 appear here.] [38] The possession of old pieces of uniforms is regarded as a sign of higher position. On the farms the women dress in Herero fashion as soon as they can: they wear the high turban and regard it as extremely unseemly to take it off. There is considerable demand for European shoes. The Bushmen fear nothing as much as injury to the soles of the feet by the long thorns. Like all peoples who now live in [412] the stage of a wood or bone culture, the Bushmen, too, possess [325] the three most important iron tools: the short ax, obtained in [439] trade from the Blacks; an awl; and a pocketknife. Very small children run about naked; later they are given a little apron that, [531] in the case of the girls, is often attractively adorned with bead embroidery. Extraordinary stress is put on ornamentation. Ostrich 301 egg beads hold first place in this respect. Individual !Kung are [321] masters at manufacturing them and achieve a certain affluence [556] by trading them. This work is done by the men. The beads are [462] [306] strung in long chains on tendons or bast cords and are worn around the neck. [Fig. 9 appears here.] Small chains consisting of [302] three or four links are tied to individual tufts of forehead hair to lengthen them.

301 lengthen them. Some people possess such a great number of these chains that they cover the entire forehead. Children often wear small rectangular pendants, and women have large, medallion-like round ones that are worn like a diadem in the middle of the forehead. Little chains of small ostrich egg beads up to five centimeters long are worn as ear pendants. Children are also given armbands and anklebands made of ostrich egg beads. Brass beads from ancient times are rare and are worn exclusively as hair pendants, as are copper beads. Glass beads are not greatly valued, and only blue ones are worn, if any. On the other hand, beads made from aromatic wood are common. Longer chains of alter-
[756] nating wood and ostrich egg beads and worn in the hair are insignia of the female doctors. The men have tight little leather straps
[827] at the wrists and ankles, which probably serve to strengthen the
[411] musculature in running and using the bow. In addition, they have a few armbands of brass or iron. Every man and woman wears a string around the neck, which has one or two appetite sticks (see
[777] below) and various talismans attached at the front. Finally, a little horn containing various kinds of medicine is worn around the neck by many of the men. The younger women and girls
[303] usually also possess a tortoise shell powder box of the kind described below for the Dama. Body painting is scarcely practiced;
[302] concerning tattooing, see page 56. The children occasionally wear armbands that they make themselves with grass or various fruits.

[38 cont.]

Weapons

411 The Bushman's chief weapons are the bow and arrows. The bow staff as a rule has a round transverse incision and tapers off slightly toward both ends. The !Kung of the Otjimpolo Veld, on the other hand, use palm wood like the Ovambo. There the wood of the bow is slightly convex on the outside and flat on the inside with squared sides. The string is made of leather, so that in the case of these bows the bow staff is more flexible than the string. A bow of the Otjimpolo Bushmen was 115 centimeters long and 13 centimeters high. The bows of the !Kung discussed here also have leather supports on both sides and commonly are

[291]
[531]

Fig. 9. Embroidered Front Apron of Leather (!Kung).

reinforced with sisal cord. The bows of the Hei//om seem to be differentiated from those of the !Kung primarily in [39] that the bow staff is flat on the outside and convex on the inside. In lieu of the leather strips, reinforcements of palm bast are also often used. The string, depending on the region, is a waxed plant fiber cord, animal tendon (kudu), or fine, twisted leather. The length is about 120 centimeters; the height, 20 centimeters. There are also much smaller bows, however, 95-110 centimeters long.

(283)

192 The wood of the !Kung bows is called !howa. The arrow
411 is made of wood. The shaft is called //gau; the feathering,

3: Lebzelter--72 E-5 (1926-1928) 1934 FX10 Bushmen FX10
!KUNG

[39 cont.]

192 sometimes radial and sometimes in rows, is called !khui. The
411 incision at the lower end of the arrow shaft is called /gei. The arrow points are usually little triangular iron plates (//khai). The entire tip, including the binding and the poisoned part, is called !hui. [Figs. 10 and 11 appear here.]

411 The arrows are 65 to 68 centimeters long. They are usu-
278 ally poisoned. The poison, which looks like dark wax, is smeared on little sticks and preserved in this way. It consists of five in-
[463] gredients, the most important of which is euphorbia sap. Only

[824]

Fig. 10. Buphane disticha Herb., Plant Used for Arrow Poison by the !Kung (Medley Wood, Natal Plants, VI, 1912).

Fig. 11. Acocanthera venenata, Plant Used for Arrow Poison by the !Kung (Sim, The Forests and Forest Flora of the Colony of the Cape of Good Hope, 1907).

certain persons prepare the poison. They know that the plant poisons are not equally effective every year. Hence, a small bushbuck is shot first, then a larger animal (say, a leopard), and finally a gemsbok. Only when the proper results are obtained with all these animals is the poison traded.

411 The lances of the !Kung consist of a shaft about 160 centimeters long, which is greatly reduced in thickness toward the back end.

[39 cont.]

411 The head is made of a quadrangular piece of iron 30 to 40 centimeters long and set into the shaft with a short connective piece. The shaft is reinforced at this point by a winding of iron wire.

[40] [Fig. 12 appears here.]

[41] Musical Instruments

534 Large dance drums are very popular, but are not made by
[439] the !Kung themselves; they are obtained in trade from the Okawango. Once, when I purchased such a drum from a trader of ostrich egg beads in the region of Kuntsas (the drum always be-
[422] longs to a specific person; collective ownership of utilitarian objects is unknown among the Bushmen), he asked me to let him keep the drum until evening so that each man would be able to drum once more. The dance rattles made of fruit are no longer to be found except in very small numbers. The !Kung are also supposed to possess wooden trumpets used on special occasions. I have never seen them.

413 Finally a small number of special utilitarian objects should
[304] be mentioned. In practicing their calling, the doctors use cupping glasses, made of antelope horn, and blunt little sticks to knock out
177 teeth. Poisons and medicines are now manufactured and cooked
415 in empty tin cans; in fact, tin cans and tin gasoline containers are
278 gradually becoming universal objects even among the Bushmen.
805 Messenger sticks or calendar sticks are made on special occasions;
211 these are little staffs or little boards with one or two rows of holes. For example, if I tell the Bushman that I will return in five months, he will draw a string through five of the holes and knot it. At each full moon, the string is drawn back one hole.

12. Social Organization

622 Each kin group has a chief, whose position is hereditary.
[614] To be sure, his powers are insignificant because one's whole life is public, so to speak, and the authority of the old men is so
[888] great that the decisions arrived at are essentially agreements
[623] between the chief and the other old men.

[TEXT CONTINUES ON p. 25]

[41 cont.]

622 between the chief and the other old men. When the village chief dies, it is not his eldest son, but the eldest son of his sister [Figs. 13 and 14 appear here] who takes over the village.

582 There are certain marriage prohibitions and requirements, which are illustrated by the following schema.

[534]

Fig. 13. Dance Drum of the !Kung (Kuntsas). (Greatly reduced.)

[805]
[211]

Fig. 14. Calendar Board of the !Kung (actual size [as shown in the original text]).

Father's brother X wife	Father X mother	Father's sister X husband
Brother--sister	A--sister	Cousin (male) -- cousin (female

If A is taken as an example, the children of his father's sister are his cousins. Marriage with these cousins is prohibited. On the other hand, A must marry the father's brother's daughter if she so desires. The man on his part, however, cannot force the

[41 cont.]

582 girl to marry him. Naturally, these sisters ordinarily do not remember their prerogative until they have failed to get another man whom they desire. Thus the young men are often forced to marry girls who are much older than themselves. If the wife 587 dies, the widower must marry a sister of his wife in case she agrees. [42] If, on the other hand, the man dies, the widow (589) must stay with the parents-in-law for about a year. It is illegal to marry the wife or the children of a deceased brother. The widow must marry a man from another kin group and move to his village (1). The boys belong to the father's kin group, the girls to 611 THE MOTHER'S KIN GROUP.

768
842
589
732
627

1. "The fate of many a young childless widow is much worse, however. A Bushman communicated the following concerning this matter: 'When a man dies and leaves behind a wife without children, and the brother-in-law refuses to accept his brother's bow and thereby his sister-in-law, she may return to her father's village. But this does not by any means always happen. As a woman who did not bear children she is not highly regarded. Her life has no significance. The men of the village talk about her case and designate one from their midst to destroy the useless life. This man will come to the widow's hut in the evening and will sit down across from her at her fire. He has a bow and arrow with him. The widow knows what is in store for her, but gives no sign. The two talk about trivial matters. After a while the man takes the bow in his hand and shoots an arrow through the heart of the woman sitting across from him. The unfortunate woman dies and is buried as inconspicuously and as quickly as possible. Blood vengeance on the part of the woman's kin group is not to be feared. After all, she did not bear any children.'" (Zastrow and Vedder, op. cit., p. 419.)

[42 cont.]

the mother's kin group. One of the tasks of the village chief is the guarding of the socha fire. Socha means pure or sacred or taboo. Foods that are prohibited for certain age groups or for one sex are "socha" for these persons. The word "socha" seems to me to be a very ancient one, or else it is a loan word from another language. Every place has at least two fires: the ordinary one, which is available to everyone, and the socha fire for men only. When the village moves to another place, the family head takes the socha fire along. During the march veldkost is gathered. Once they have arrived at the new place, the family head starts a new socha fire under a tall tree and roasts the veldkost. The boys leave immediately and go hunting, while the women and girls set up the windscreen. Whatever the old man has roasted at the socha fire he is supposed to eat by himself; ordinarily this is what he does. Finally a messenger arrives and announces that a head of large game has been killed. Hours pass; the old man simply remains seated there, while the women and children make themselves comfortable in the new windscreen. [Fig. 15 appears here.] The game is brought to the socha fire, and the meat from the legs and shoulder blade is cut off and given to the women and children, who are never allowed to eat meat from the bone. All the rest is consumed by the men at the socha fire. The village chief also has the task of organizing the celebration for the first veld fruits. The hordes that I visited no longer practice this custom. Vedder has described it for the !Kung of Gaub.

When Lieutenant Fischer rode from Namutoni to the Okovanggo in 1908, the Bushmen everywhere still had a tight organization and a common leader. When Captain Francois went beyond Grootfontein for the first time, he was given considerable support by the chief of the !Kung Bushmen. It is worthy of note that the famed copper mines of Tsumeb, on which the welfare of Southwest Africa depends to a great extent, were discovered by a Bushman chief (2). Since then the eastern !Kung have not had a

2. He himself was a half-breed.

chief. The northern !Kung supposedly still have one. The oldest chief I heard of was "X'amme," the lion. He was a great huntsman.

[42 cont.]

178 He died when his successor, Amme, was still a small boy. Amme,
622 however, was unable [43] to learn much from his father; he was not a good chief, and he died while still young. Since then the !Kung Bushmen have not had a supreme chief. One of my informants, Doctor X'amme, claimed to be the great-grandson of the great chief of the same name.

The following from Von Zastrow and Vedder (1) should

1. Op. cit., pp. 412, 424.

be mentioned:

593 "The father is the chief of the family. All must respect
596 him. Children may not call him by name. -- The chief's posi-
622

[276]

Fig. 15. Dacha Pipe of the !Kung Bushmen (from the Lindenmuseum, Stuttgart, 29464).

tion is generally passed from father to son. If the son is not yet an adult when his father dies, the father's younger brother takes
423 his place. Each kin group has a territory that has been inherited
614 from ancient times. The territory is called Gao and might correspond to the German concept Gau [canton, district].

"There are kin groups that are so far apart that a journey of several days lies between them. For example, the territory north of the Omuramba-Owambo near Kajus, where the manketti tree (Ricinodendrum bantaneni) occurs, belongs to a kin group that ordinarily lives over 100 kilometers away and comes there only when the oleaginous fruit is ripe.

"Kin groups with two hunting and gathering regions come into being through the fusion of two kin groups that have intermarried for so long that fusion came about automatically.

[43 cont.]

423 "The graves of the ancestors are within the kin group's terri-
614 tory. They are marked by the large piles of stone placed on them.
769 The ancestors are regarded as the guardians of the kin group's territory. Hence, departure from the territory must be announced by the chief or an elder at the ancestral grave without special ceremonies; similarly, an announcement must be made there when the kin group again moves into the territory."

423 The property of the kin group, aside from its territory, in-
614 cludes the veldkost, the game, and, above all, the watering place.

13. Illnesses and Treatment

826 The anatomical knowledge of the Bushmen is quite extensive as a result of their way of life as hunters.

The heart is regarded as the seat of life, and the breath
[761] has some connection with the heart. Their surgical knowledge is
752 confined to the extraction of thorns by means of an awl-like in-
757 strument and to the relatively effective bandaging of hand and leg
278 fractures. Their supply of medicines, on the other hand, is very limited. In what follows, I shall list the common illnesses and their treatment.

Eye Inflammation

752 Both dry and exudative eye inflammations, caused by sand and irritating grass seeds, are extremely widespread, and blear eyes are the rule among older people. These diseases, however, are not nearly as grave among the !Kung living in the forest as, say, among the Bushmen of the western Kalahari or among those
[826] of Naukluft. Among the latter, blear eyes are even regarded as signs of beauty in young girls. Ordinary eye inflammations that pass in a short period of time mean nothing. They are treated by
[753] rubbing with fat. If the ailment lasts for a longer period of time, then //Gauab [Fig. 16 appears here] certainly had something to
[755] do with it; the doctor is called in and, after some treatment, produces a "little black medicine" from the eye.

[43 cont.]

732 Blindness in one eye is very common as the result of wounds inflicted by thorns. Among very old people I have also found blindness as the result of cataract. Here and there one also finds (648) Bushmen who in olden times had been captured by the Herero, who shot out their eyes with grass seed.

Ear Ailments

757 They are relatively rare. For an ordinary earache, leaves are stuffed into the ear "so that it will stay warm." The aching ear is likewise held over the fire, in which some medicine has been placed. If pus comes out of the ear, the ache stops and all

[413]

Fig. 16. Scratching Instrument. Iron leaf fastened to a little stick with resin and leather strips. (Museum of Ethnology, Hamburg; actual size [as shown in original text].)

(753) [44] is well. If //Gauab has put something in it, however, the pains become so strong that one can no longer sleep or hear. In (755) such cases one must call an especially powerful doctor, who draws out the spirits of sickness; otherwise the patient will die.

[44 cont.]

Toothache

142 I rarely saw irregularities in the position of the teeth, and
[515] never protruding or receding teeth. The only care given the teeth is the use of iron arrow points for toothpicks. The teeth are usually yellow, covered with dense layers of tartar, and because of the sand content of the vegetable diet, are quickly worn down
164 by chewing. Caries are extraordinarily common, but infections also occur through the exposure of the root canal as the teeth are
753 worn down. If a person has a severe toothache, //Gauab has stuck a needle into it, and the doctor must be called to get it out. If there is no general discomfort, however, then no dsao are there.
757 A little piece of wood is sharpened to a point at one end, held with the point against the root of the tooth, and then the tooth is knocked out with a stone. This instrument is called "oie."
147 Small children suffer considerable pain when they teethe; some-
753 times dsao (spirits of sickness) are also at work in this case. [Fig. 17 appears here.]

Sore Throat

753 A sore throat means that //Gauab has made a cord and is
755 drawing it tight around the patient's neck. The doctor must remove the cord from the patient; it is about 30 centimeters long and is like the trap cord (//kao); everyone can see it after the treatment.

Colds (X'ōā)

164 Grippe takes many victims among the Bushmen every year,
513 especially among those who are already tuberculous. In winter, colds are extraordinarily frequent, since the people lie almost naked around the fires. In the forest they are fairly well protected against the wind, but on the open plain the wind changes its direction at night while they are asleep, so that they not only catch cold but often receive severe burns around the stomach -- although this applies only to the men; the women sleep at a greater distance FROM THE FIRE.

[44 cont.]

000
757
278

from the fire. As a cure for coughing and hoarseness, they chew the fibers of a sisal-like plant, which are twisted to make the trap cord. The plant is called kũi. It must be brought fresh from the forest. For chest pains, in recent times they have started drinking warm water to which much cooking salt is added.

[413] Fig. 17. !Kung Instrument for Knocking Out Teeth; actual size [as shown in original text].

Circulatory Diseases

164
278
751

As among the Central African Pygmies, we find strong sinuosity of the arteria temporalis even among more youthful individuals. The heart quickly wears itself out as a result of the exhausting way of life and the great amount of running. The people try to increase its capabilities in every way possible. In order to stop the pounding of the heart and to run longer, they take the leaves of a tree with red fruit (in-gui). These leaves are chewed and swallowed. If this does no good, they chew the root of the ≠Na tree. If a person has a heart pain so that he cannot run, he takes roots of the Dormakar bush (!gu) and of the Hell bush (!gai !dsao), boils them both, and drinks the decoction. In case of angina pectoris, the skin of a boa constrictor is placed around the chest.

Gastrointestinal Disorders

753 [171] It is interesting to note that the doctrine of the importance of the liver and gall bladder in the origin of disease, which we find among all primitive and civilized peoples up to the humoral medicine of the previous century, is already present among the Bushmen. When the gall bladder is full, one becomes sick and [755] vomits gall. Then the region of the liver is massaged, just as is done in the case of liver pains. Enlargement of the liver as the [164] result of chronic malaria is common. The moon, which dies [821] every month, also has gall sickness, and moonlight is the juice of the gall bladder vomited by it. Moonlight and gall are known [164] by the same word (goo). Spleen tumor is especially common 757 among children. They have no medicine against splenalgia. 278 They have no medicine for inducing vomiting. It is induced by putting the finger or a feather into the mouth. To stop vomiting, one chews little twigs of the goro tree. The bitter wood of the liana (χ'áá-χ'áñ) is chewed for stomach-ache. In case of con- [753] stipation the doctor must practice magic, for it is assumed that [755] the dsao have tied the stool in the intestine, and the doctor must loosen and extract the cord, just as in the case of an inflammation of the throat. The patient may not eat anything and drink very little. In case of diarrhea, even the bleeding kind, the same medicine is taken as in the case of stomach-aches. Intestinal 147 worms are unknown. We already know from earlier reports that the 262 gastrointestinal tract of the Bushman can take all kinds of things that we cannot take. As the result of habituation from early childhood on, he can digest meat that has gone bad and the like, without any trouble (1). After a long period of hunger, he can consume

1. I myself witnessed a drastic example of this. I had brought a side of bacon from Swakopmund, which supposedly had been preserved for all eternity according to a special process. When I brought it out, it had a hideous smell, and in order to prevent the Bushmen from taking it and getting sick, I had it hung high on a tree. The

[45 cont.]

147
262

> Bushmen stared longingly at the discolored lump of fat. Finally they sent a deputation to me, saying that they wanted the bacon for their dogs. The moment they received it, it was skillfully divided according to families and consumed in the course of a great feast, without any harmful effects.

enormous quantities, but such excesses as a rule are followed by an indisposition. The day after a major feast, almost all of them lie in the sun with stomach-ache and gripes. In other words, even a Bushman should not be credited with the impossible with regard to food; many things that seem repulsive to us, such as earthworms, lizards, thick grubs, mice, and the like, are in themselves not at all harmful to health, especially since the Bushman only eats them cooked or roasted. Bushmen who have grown up on the farms can take the same diet as the Whites or Blacks. On
147 the other hand, the wild Bushmen who have grown up on veldkost
262 and the flesh of wild animals cannot accustom themselves to the
648 work and prison diet of the Blacks. A term in jail of any great length means condemnation to a slow but sure death for most Bushmen. The prisoners show the symptoms of vitamin deficiency, become infirm, get edemata on their legs, dropsy, and unfailingly perish. In the initial stage severe sluggishness of the bowels sets in. Ample portions of fresh meat can keep the Bushman healthy even in imprisonment. The fact that Bushmen run away from the
[464] farms is based in most cases upon their inability to endure any
[146] longer the diet given them. The vitamin need of the Bushman who has grown up in the wilderness is undoubtedly much greater, and his longing for meat, which often appears pathological, can be explained as a physiological craving for vitamins.

Diseases of the Urogenital System

164 Catarrhs of the bladder occur; in such cases a flat stone
(755) is warmed in the fire and placed on the bladder region. Hematuria, evidently the result of nephritis, was twice treated by my friend

164 [45 cont.]
[753] Dr. Kasi. The people died. Very evil dsao were involved. The
[192] terminology for the description of the external genitalia is by no
[302] means as rich as among the Bantu. The women's pubic hair is
[593] usually plucked out by their husbands. Hence, it is called virgin
842 hair. The connection [46] between cohabitation and pregnancy
[757] is known. Impotence and sterility occur; there is no medicine
[278] for them. When menstruation fails to occur, nothing special is
841 done. The menstruating woman may only eat with her husband
[757] and may not go around tasting food. A warm stone is placed on
853 the stomach for menstrual pains. Children are nursed at least
[826] until the birth of the next child. The nipples are distinguished
164 by a leathery firmness. Nevertheless, mastitis does occur.

The contention that venereal diseases are very widespread is incorrect; as such they are even unknown to the Bushmen. In isolated cases I have met Bushmen on the farms with vestigial gonorrhea. Syphilis is very rare among the wild Bushman.

Skin Diseases

The wild Bushman scarcely knows anything about skin care.
[515] Since there is a lack of both water and fat, the skin, which as a rule feels silky, soft, warm, and dry, becomes cracked, and infections easily occur. A chronic eczema (gari), evidently caused by a fungus, is very widespread. To combat it, they use the milky
[278] sap of a plant called timba.
[757]

Hair Diseases

A nonmalignant hair disease that is very widespread among all the Bantu, causing the hair to fall out in roughly circular spots, is also found among the Bushmen. In addition, as among the Bushmen of Naukluft, the so-called "porcelain head" occurs, a disease that destroys the entire hair base, and the head gleams
[145] like porcelain. The hair becomes gray relatively early. Loss of hair is rare; it usually occurs in the form of baldness characteristic of schizothymia. The rounded fingernails are worn fairly long;
302 the toenails are often fissured.

[46 cont.]

Infectious Diseases

164 The Bushmen are plagued by the two most dangerous chronic infectious diseases, tuberculosis and malaria. Leprosy is absent.

Malaria appears every year during the rainy season. Bisob
[757] roots are then thrown in the fire, and the smoke is inhaled. Small
[278] children more commonly die of it. I did not see any cases of black water fever or malarial cachexia.

Tuberculosis is the common cause of death among the
[165] Bushmen. I saw bone tuberculosis and swellings of the glands, as well as advanced cases of lung and throat tuberculosis. The poor people are helpless, and the frequent colds further the process in a dangerous fashion. As nomads living in small groups, they are generally spared the epidemics of the Whites and Blacks. Once an epidemic has made its appearance among them, however, they die in great numbers. It is interesting to note that the Bushmen are aware that contagious diseases exist. As such, however, they only know the above-mentioned skin disease (gari).

753 The other infectious general diseases are explained as an attack by many spirits of sickness upon the horde.

Assistance at Birth

844 When a young woman anticipates her first confinement, she remains near the huts because she is afraid. The older women cheer her up, and then a resting place is made of dried grass. The woman gives birth in a squatting position. In case of difficulties
[845] during delivery, the lower part of the body is massaged. Medicine or manual assistance to expedite the delivery is not given. The umbilical cord is cut off with a quartz knife and buried.

[47] Wounds and Injuries

752 The most dangerous injury a Bushman can receive is through a poisoned arrow. The poisoned arrow is cut out, a piece of wood is held in the fire until it glows, and then it is used to

[47 cont.]

752 burn the wounded person at many places on his body. When the poison smells the warmth, it gathers at these places; incisions are then made there, and the blood is sucked out by means of a cupping glass made of gemsbok horn. The wounded person may neither sit nor lie down; he must be walked about for twenty-four hours. After this time he either dies or is cured. The method helps only in rare cases.

Snakebite is the second great danger. If one makes an
751 incision in the lower part of the calf and rubs scrapings from a
824 bisob root into it, the snakes smell this and do not come out of
825 hiding. [Fig. 18 appears here.] When a person has to run great distances, bisob dust is mixed with fat and applied
752 to the legs. In case someone is nevertheless
(411) bitten by a snake, the treatment is analogous to that used for arrow wounds. Injuries to the feet caused by thorns are very common. Injuries that pass through the aponeurosis are regarded as deadly. They practically always become infected. Even though wound infections take a less malignant and a slower course than among Europeans, they nonetheless sometimes lead to death. The only medicine
(278) used is bisob powder scattered in the wound.

Fig. 18. Kirri of the !Kung.

756 Some doctors claimed to be immune
751 to snake and scorpion bites.

What Vedder observed among the Bergdama is reported in a similar manner by Schinz:

"With the intention of testing the latter characteristic, I one day persuaded an old sorcerer visiting us in Noi !as on Ngami Lake to undertake an experiment with 12 scorpions (Buthus randus Simon) picked out by myself and having an average length of eight centimeters. In order to prevent any possibility of deception, I put the animals on the various parts of his body with tweezers, on the hands, legs, arms, mouth, and testicles. As a rule they then immediately and excitedly moved the long postabdomen back and forth and jabbed violently once or twice into the flesh of the guinea

[47 cont.]

756 pig concerned, at which time in each case a large drop of white
751 fluid escaped from the stinger. Finally they moved about quietly without making any further attempts to sting, but they did not in any way show the excited hurry to get off the Bushman's body that has been reported by individual writers. The old man claimed not to feel any pain, and I have no reason to distrust him since, after all, if the poison had had any kind of effect upon him, he would scarcely have allowed himself to be stung in the most sensitive parts of his body for the sake of my desire for knowledge. Even a full hour after our experiment, the parts that had been stung did not show the slightest alteration. The man declared that he had attained this extraordinary faculty as a boy in the 'school' of a sorcerer, where he had been urged to apply scorpion poison, which had been taken forcibly and thinned with water and urine, on small incisions, as well as to eat the poisonous stingers pounded to a mash and boiled; supposedly immunity against snakebite can be obtained in like manner."

14. The Doctors' Test

755 One afternoon the eldest of the horde outside Keibeb came
756 to me and told me that that night a great dance would take place,
796 first, because a three-year-old child had just been bitten by a small black snake, second, because many people were sick with fever, and third, because one of the men wanted to undergo the doctors' test. Such festivals take place only during the time of the full moon. Toward nine o'clock in the evening I was lured into the camp by wild noise. The people had made somewhat larger and more fires than usual. The mother with the child bitten by the snake was seated in the center of an open semicircle. The older women squatted around her. To one side of them in single file, one behind each other, stood the younger women and girls. Both the male [48] and female doctors were busy. The chief female doctor, Biri, was "personally" absent this evening. She was crouching off to one side in the darkness of the bush. /Nawa,
[787] the highest of the //Gauab, had taken possession of her and spoke through her mouth. Her hair ornaments, long chains of beads made

[48 cont.]

755 from ostrich egg shells, had been put on by her proxy, Dube, a
756 very intelligent young woman. The latter, standing at the end of
796 the semicircle of seated women, conducted the ceremony. She
[276] was in a very good mood and alternately smoked her Bushman
[554] pipe and my cigarettes. There is a kind of hierarchy among the women; those who were squatting were higher in rank than those who were standing. All the women clapped their hands and sang in a monotonous rhythm: ehe, ehe, ehe, ehe, etc. This, I was
[533] assured, was no song, but "music." Some hordes have bartered

[532]

Fig. 19. Sorcerer in a Bird Mask, Followed by Spirits of Sickness. (From Rock Paintings in South Africa. From Parts of the Eastern Province and Orange Free State. Copied by G. W. Stow. With an introduction and descriptive notes by Dorothea Bleek. London, Methuen, 1930.)

dance drums one and a half meters high from the Okawango, which on this occasion are played by men. [Fig. 19 appears
[184] here.] Among the Bushmen of the Sand Veld the female leader of the ceremony does not wear the ornaments of the chief female doctor; instead, the ornaments are hung on a tree. The position of the chief female doctor is not permanently held by one person; the chief doctor on occasion imparts supernatural powers to her.

755 The five doctors had taken off all their ornaments and
756 were naked except for the front apron. They put themselves
786 into an autohypnotic state by means of crowing, by producing
796

[48 cont.]

755 756 786 796 sounds similar to those of ventriloquists, and by certain muscle contractions. By pressing together the gluteal musculature of the buttocks and at the same time holding the knee joints as far apart as possible and pressing the legs together at the ankles, they eventually produced a tonic trembling cramp of the entire musculature of the lower extremity, in which they reeled back and forth. It is possible for anyone to put himself into an autohypnotic state in this way, as this author also learned from the doctors. Soon the rolled-up eyes indicated that the doctors were in a state of trance. They danced around one another, fell over one another, and lifted one another up. Some women also started making noise with the dance rattles. The Bushmen were now convinced that [787] /Nawa himself was dancing among the doctors, was visible to them, and spoke with them. At this point they say something [782] like prayers; they invoke the great spirit of the old Bushman who has killed many elephants; they call the spirits of the dead who have sent their little spirits of sickness over the living, and they especially beg /Nawa to transfer these little spirits of sickness to the doctors.

755 756 796 The doctors ran alternately to the bitten child and to those ill with fever who squatted around the fire, stroking the painful places, both from the armpits down to the soles and from the shoulders down to the fingertips. Occasionally they also sucked at the diseased spots or inhaled the breath from the mouths of the patients.

From time to time, the doctors performed these operations upon one another, first of all, as they said, in order to distribute the poisons of sickness equally among all the doctors, but also in order to obtain power from the other doctors. Thus "charged," the doctor then again ran to the patients to take their poison.

Now and then the chief doctor ran screaming around the [787] line of standing women and [49] disappeared into the bush in order to ask the chief female doctor about the will of /Nawa. After about an hour's dancing the chief doctor went to the bitten child. The child had been bitten on the back, and this was rubbed with fat and then medicine; then all the patients were again subjected to the treatment described above, and soon thereafter /Nawa an- [787] nounced through the mouth of the chief female doctor that the

[49 cont.]

[787] 755 756 796 child, and the other patients, too, would be cured. That ended the first part of the ceremony.

Now the doctors' test began. The others, with the exception of the women making music, participated only as spectators. The doctors went on dancing, often holding their arms stretched out to the sky, with the fingers spread apart, and then springing to the fire and holding their hands over it. Flinging the hands toward the sky is done to give some of the little spirits of sickness back to the chief spirit /Nawa, who passes up and down along a thread between heaven and earth. It is not a gesture of prayer. Similarly, holding the hands over the fire is intended to achieve the same result, because the "little spirits of sickness" do not like the fire and hence will go away. Meanwhile, they thank the great spirit for having saved the child. Then they prayed to /Nawa that he might concentrate all the little spirits of sickness on the doctors' candidate and kill him so that the people would be free [753] [761] of evil diseases, for the dying person takes the spirits of sickness with him. By brushing, rubbing, and blowing, the old doctors now transfer the spirits of sickness to the candidate. The latter is completely exhausted, collapses from time to time, is constantly lifted up again, and, staggering, he dances on, with foam appearing at his mouth. The other doctors taunt him: "You leopard, you lion, you elephant, you insurmountable mountain, you gigantically strong man, now you can't cope with the spirits of sickness we have given you." Once more the chief doctor runs to the former patient and transfers to the candidate any disease poison he may have gathered. This hellish spectacle lasted one and a half hours; then the chief doctor went to his oracle sitting in the bush and asserted that the candidate was too strong: we have concentrated all the little spirits of sickness upon him and prayed to the chief spirit that he might take (kill) him, but the candidate is stronger than the spirits of sickness. Nevertheless, the oracle commands: "Dance on." While this happened, a woman came out of the background -- in the half-dark I was unable to see whether or not it was the chief female doctor herself -- and busied herself around the cured child. She clapped her hands and beat her palms together, with the thumb sides in front of the child's face, and thus put even the child in a brief trance. The dancing continued until around midnight when the oracle finally declared that though the

[49 cont.]

755 756 796 chief spirit was not yet satisfied, she would appease him; the chief spirit would voluntarily take the little spirits of sickness away, even from the doctors. After these words the festival abruptly ended; the people went to their fires and lay down to sleep.

The candidate had passed his examination (1).

[184] 535 756 796

1. Burchell (in the translation by Hellwald, Völkerkunde [Ethnology], II, p. 519) has given a similar account from the south: "One foot remains stationary, while the other is in rapid and irregular motion without any definite change of position. The movement of the arms is so slight as to be negligible. At the same time the dancer sings without pause and keeps time with the movements. Occasionally he lowers his body and then suddenly raises it again, until finally he sinks to the ground exhausted, but still singing and rhythmically moving his body in time with the song of the spectators. Even though only one person dances at a time, the company present nonetheless also has something to do, etc."

756 786 789 796

When the excitement of the dance has reached its climax and the dancers have fallen into a kind of trance as a result of the continuous dance movement, the shrill singing, the drinking of coffee, and not least the tobacco smoke, which they keep in their mouths for minutes on end for the intoxicating effect, then the doctors, in order to demonstrate their resistance to fire, trample with bare feet on the red-hot embers taken from the campfire and spread out on the sand. In the case of a number of the younger ones, however, I believe that their resistance to fire was not quite as great as they would have one believe, and they carefully avoided the pieces that were

[49 cont.]

756 786 789 796 glowing all too brightly. On the other hand, I was surprised when on the occasion of such a religious dance the so-called great doctor -- after he had danced by himself long and continuously in visible ecstasy, so that in spite of the cool night and even though he was almost completely naked, the sweat ran down his entire body -- suddenly, with slow majestic steps, walked through the high flames of the fire and in so doing had to step on the burning logs with his bare feet.

753 776 [50] On a later occasion I discussed these procedures thoroughly and in detail with the chief doctor, Kasi, and with Dube and the other doctors. One of the most striking aspects of the entire ceremony is perhaps the absence of the mysterious and the magical. These little spirits of sickness are not magical creatures but, in the eyes of the Bushmen, commonplace realities. The Bushmen know very well that many illnesses are not caused by the spirits of sickness alone. If someone eats something that has gone bad, he will become ill and will be given an emetic. If someone is wounded by a shot, the wound will be treated. If the injured person has pains only in the wound and otherwise feels all right, then no spirit of sickness has entered into him. If he feels sick all over, however, then he is possessed by a spirit of sickness. These little spirits of sickness are called dsao; they are little yellow men with a fat belly and a little tail. They obey the other spirits, which, as described above, include the ordinary (775) spirits from the bodies of deceased persons, the spirits who live among the stars, and the chief spirit (/Nawa) himself. [Fig. 20 appears here.]

Finally, even the "great captain" can send the dsao directly over a person. /Nawa can do this with or without the consent of the "great captain"; the smaller spirits act on their own authority or at the command of these powers.

756 776 The doctors have their supernatural power directly from the "great capitain"; they are as powerful as /Nawa and stronger

[50 cont.]

756 than the smaller spirits. Their treatment is correspondingly suc-
776 cessful or unsuccessful. In other words, the doctors are vindicated in any case.

755 The treatment of illness thus follows two parallel paths:
757 one with natural means (medicines and the like), directed at the local symptoms of the ailment; and one with supernatural means, directed at the dsao that cause the feeling of sickness.

[756]
[796]
539 During the doctors' test the following song is sung:

[411]

Fig. 20. Bushman Revolver of the !Kung (Foxhof; actual size [as shown in original text]).

e hehehe na ti //kau /goa dsao

During the treatment itself the following text is sung:

/o ma ga //goa ≠am /nai tha

He has no medicine yet, he must be thrown with the medicine.

751
756 Von Zastrow and Vedder (1) have the following to report

1. Die Buschmänner, p. 424.

[50 cont.]
751 concerning the witch doctors:
756 [51] "The sorcerer can protect himself against the malignant spirits of evil deceased persons. After all, he can see them and knows the means for defending himself against them. The ordinary Bushman has no eye for them, but he has a means of keeping them at arm's length. In a small leather bag about as long as a finger [411] he keeps a bow carved out of horn and numerous horn arrows stuck in a shaft of sour grass [Cyperaceae]. If he has occasion to fear evil spirits, he shoots these miniature arrows in all directions with his miniature bow. Now the evil spirits cannot get at him.

"Since in addition he has the belief that an object merely thrown in the direction of a hated person in some mysterious fashion enters that person's body and gravely harms him, he likewise uses his miniature bow to keep a pursuer or enemy off his neck by shooting an arrow, with a curse, in the direction where he imagines his enemy to be, even when he knows that this person is miles away from him."

Whereas I myself and the highly experienced J. Lunkenbein
411 regard these Bushman revolvers as harmless magical instruments,
[114] Seiner has a different opinion:

"The 'revolver' is a definite instrument of murder carried hidden in the modesty apron. The bow is ten centimeters long, the arrows are from ten to 12 centimeters long, and with the former they are put in a little bag adorned with beads. In addition it should be noted that the arrows, which are wrapped crosswise with little bands of tendon, are poisoned by being smeared with [278] little bits from the body of the arrow poison caterpillar. The Bushman ordinarily crushes a few of the caterpillars, which are available only in December and January, living on a few Commiphora shrubs (Commiphora dinteri, C. seineri) or as pupa at the roots under the ground, in a bone vessel with a little wooden stick that is always in the quivers; then he smears the arrow with some sticky stuff, such as wax or resin, whereupon he brushes the arrow with the viscous, slimy caterpillar mass, which, after drying, covers the arrow as a more or less thick brown crust. Up to a distance of seven meters it is possible to puncture the skin, drawing blood, with this miniature arrow; if the arrow tip were not blunt but pointed, like the one placed in the grass shaft, the arrow would

[51 cont.]

411 penetrate the flesh itself and introduce much more poison into the
751 wound. The Bushmen try to protect themselves against this treacherous, but apparently frequently used weapon by attempting to immunize themselves against the poison. During a period of from three to four weeks they make small incisions on the crown of the head, which they keep open in order to rub increasingly greater doses of poison into the wounds. The consequences are purportedly symptoms of a more or less serious nature, with fever and vomiting."

000

The Mandrake Root (1)

1. In this connection cf. Hans Bächtold-Stäubli, Handwörterbuch des Deutschen Aberglaubens [Dictionary of German Superstitions], Vol. I. The principal source for the medieval superstition is a passage from the history of the Judaic War by Flavius Josephus (born 37 A.D.). He writes (Bellum judaicum, VII, 6, 3; works translated by Cotta and Gförer, Philadelphia, 1838, p. 762): "The valley that encloses the city of Machärus on the northern side is called Baara and produces a root of the same name. It is flaming red and in the evening throws out red rays; it is very difficult to tear it out because it withdraws from the person approaching it and remains still only if one pours urine and blood flow (menstrual blood) on it. Even then death is certain to result from any contact unless the entire root is carried away in the hand. One can also get it in another way, namely: One digs around it in such a way that only a small part of the root remains hidden; then a dog is tied to it, and when the latter tries to follow the person who has tied him, he pulls

[51 cont.]

000 out the root, but dies on the spot as a sacrifice taking the place of the person who wants the plant. Once one has it, there is no longer any danger. People take so much trouble to get it because of its following peculiarity: the demons, that is to say, evil spirits of wicked human beings who enter into the living and kill them unless help is quickly given, are driven out by this plant as soon as one so much as brings it near the patient."

751 It comes from a little bush (/gui-sa). It does not occur in
754 the Bushman region visited by me, but farther to the north. It is
824 only found accidentally. When the doctor wanders through the
756 bush, he sometimes hears low talking. Soon he sees a track resembling that of a snake and showing traces of blood. The root walks upright on this track, like a stick. He may not attack it, because he would die immediately; instead he attempts to approach from the direction in which the magic root is walking, opens the medicine bag, and lets the little mandrake walk in. Then the bag is firmly closed and at home is hung on a tall tree. The mandrake may not be taken into the hut. Something like blood drips out of the bag. Early the next morning a great fire is made; women and children and everyone assemble, each one bringing his little buck horn to obtain from the doctor some of the medicine coming from the mandrake. The medicine is rubbed on the skin. Bushmen who live among the Whites may not take this medicine because they will become sick from it. -- The medicine or the magic that is given out by the mandrake has little effect on those who were treated in the manner described above, [52] but it has considerable effect in other cases. This medicine is used to kill enemies through magic at a distance. When a doctor goes to a horde that does not yet have this medicine, he carries the horn filled with it around his neck. Some of the mandrake's magic poison passes into anyone who looks at him.

754 When the doctor sits down, anyone who has looked at him keels over and dies unless he is helped. If this person is an enemy, the doctor simply goes away and does not trouble himself any

[52 cont.]

754 further. The belly of the unconscious person swells enormously.
755 When all other procedures have proved futile and someone remembers that this or that doctor has the magic medicine, he is called in, takes some of his bloodlike fluid from his horn, and first smears his own feet and then rubs the patient's feet and, above all, the patient's stomach in a circular massage. Gradually the swelling recedes, the patient gets up, sits down, and is cured.

This story, based upon the fact that there are roots with
648 bloodlike sap, became known by the farmers in a confused fashion and was the cause of the ridiculous fear of the secret poisons of the Bushmen that many farmers have.

15. The Elements

773 Heaven and earth, sun and moon, all was made by X'u,
821 the great captain, the supreme being. In the sun-scorched deserts inhabited by the Bushmen, the sun is no dispenser of mercy. During the hot season even the Bushman is forced to remain in the shade in the daytime, because the sand is so hot that he cannot walk on it.

The sun was a daughter of man. The Bushmen had seen her, and the men had to carry this daughter, but since she burned with such heat on their shoulders, the men had to frequently change places. When the shoulders of all the men were burned, they left the sun lying in the bush and did not take her to the huts. This is the place from which the sun rose. She is from the great captain.

When the sun sets, she sits down on the earth to eat. When it is to be day, one of her shoulderblades goes to the other side of the world where it appears as the sun. The sun's rays (/gam ǂnǂsn) are the arms of the sun. The eclipse of the sun (ʔǂkáo) is caused by the lions so that they can more easily eat human beings.

The Bushman becomes cheerful only when the cool of the evening arrives, and at the time of the full moon he celebrates his festivals. There is no question of moon worship, however, among the !Kung Bushmen I visited.

[52 cont.]

773 Concerning the moon, I was told: "The moon was also
821 carried by people. It was not as warm as the sun, but very heavy. So the men helped each other, and with great difficulty they brought it to the huts. The moon was a man. He said: 'I prefer to remain alone and do not wish to be among you.' Thereupon the Bushmen said: 'If you go alone into the desert, you will surely die.' But the moon did not obey, went out, and died. But then it woke up again and rose like the sun; therefore, like the latter, it is from the 'Great Captain.' When it disappears, it has died. When only one side of it is visible, then it is young. When it becomes smaller, then it is old. The color of the moon comes from its gall (/góo)."

The well-known story of the moon and the hare is told there as follows:

The moon once said to the hare: "I die and wake up again, you on earth should do the same." But the hare answered: "No, we cannot do that, we who are on earth, only you can do that because you are in the air, among us this is impossible; once we die, we do not wake up again." And the hare was right; it is still so today.

821 The eclipse of the moon, !nui dsao, is caused by the lions
[825] so that they can more easily steal into the Bushman huts.

[53] Comets, χ'u !gam, are stars of the great captain;
[777] they bring luck. When a shooting star, ≠gomma, falls, it is said,
[787] just as among us, that someone has died. The stars are the camp-
[775] fires of those spirits who at the command of the great captain come down and fetch the souls of the dying.

[823] Earthquakes, χ'áno !gee, are omens of sickness. The
[787] rainbow, !khâni !náo, indicates a good year for rain.

[782] What the Bushman begs and prays for is not sunshine but
[776] rain. The great captain alone dispenses rain.

Lightning and thunder are not beings in themselves, but are caused by rain. When someone is killed by lightning, it is said: "The rain has killed him." When there are flashes of lightning and thunder at a distance, the rain is saying: "Today I shall thunder over the whole earth." When there are flashes of lightning and thunder on various sides, the clouds are speaking to one another. And when they touch each other with their heads, the

[53 cont.]

821 rain comes down and the clouds extend over the whole world. The rain that has come down to earth does not stay there; the clouds again come forth from the earth. The rain obeys the great cap-
776 821 tain. In a storm the great captain knocks down the trees. If a person says something bad about him, however, punishment is not long in coming. X 'u says to the rain: "You must now go and kill him." And the rain goes and kills the man with lightning. But when the great captain says to the rain, "You must go now and punish him," then the lightning merely strikes the windscreen so that the whole thing collapses and the evildoer is thrown out.
[752] Then the people come running, rub the unconscious person with medicine, and burn his skin with red-hot pieces of wood until he comes to again.

Thus the angry great captain metes out punishment.

751 The Bushman concerned, however, is far from either pri-
[782] vately or publicly begging the great captain for forgiveness. He
823 821 is convinced that this would do no good. On the contrary, he puts his confidence in the following procedure: It is known that where lightning strikes quartz sand, so-called lightning tubes or fulgurites arise. This phenomenon has not remained hidden from the sharp eye of the Bushmen. My friends told me: There where lightning has struck one usually finds a stone called "rain tooth." The person brushed by lightning scratches his skin with this stone,
[224] rubs in medicine which is supposed to bring luck in hunting, and
[777] tries to hunt down a gemsbok. If he succeeds, he cooks the meat of the gemsbok with the rain tooth. If there is a second person in the horde who has previously been brushed by lightning, that person must eat the meat with him. Then medicine is made from this meat and other ingredients, and this is placed in the horn of a small bushbuck and carried around the neck by the person concerned.

751 When the "rain" comes again, he again goes to the hut
821 of the person struck, walks through the fire where the buck was cooked, takes a bone of the buck (these bones remain lying on the spot), and goes with it into the nearest tree. The bone cooks in the tree, and the scum comes out on the side and the fat below. When the rain has passed, the bone is again pulled out and cooked with gemsbok horn and duiker horn and flesh; then it is

[53 cont.]

751 burned to a tinder and pulverized to make a medicine. The per-
821 son struck now has incisions made on his tongue, forehead, cheeks, chest, and legs, into which fat is rubbed, and then this medicine is smeared on. Now, for the time being, he is safe from persecution by the rain.

16. Rain Magic

789 People turn directly to the great captain when they need
[756] rain. Not all doctors are able to procure rain, only the few who
796 enjoy the special favor of the great captain. Then a dance is organized, at which the doctors put themselves in the trance state described below. At the same time the following lament is repeated countless times:

[54]

[539] !garǎ̄ gurí dee oa ≠am	Why does it not rain?
X'uǎ dě ŋá /gaa !ǎi /gaa	Which lord is holding back the rain?
/gǎm khui hē	The sun is hot.
!kǔng-ná gurí /gǒá /gǒá	Will man live?
//gauǎna tani /gee ≠gǎo	Are the spirits bringing winter?
!kung /goá hǒǒ !koa !kung ō dshn-ǎ	Where is man supposed to drink?
//gaa /a //gõě !kung /ñ a //gõě	If it is so, can man only die of thirst?
!kunǎ //gõě ne oa	What can man do now?
Ha-!kung tam hā m tam ná /ñ gěě	We had better stay here because we have been abandoned!

756 Finally the great captain in heaven hears the lamenting.
789 The doctor runs from the dance place into the bush and sees that
787 a thin thread is let down from the sky. The doctor climbs up on
796 this thread. The great captain comes to meet him half way. As soon as the doctor sees the great captain, he throws a red powder (ocher with medicine) toward him. Now the great captain draws the doctor up and leads him to the heavenly house. In front of this house [Fig. 20 appears here] the doctor sees the spirits of
[775] his deceased colleagues who year in, year out, stand before the house.

[54 cont.]

756 house. The doctor then begins to pray: "Lord, help us, the chil-
789 dren are dying, we are dying of thirst and hunger." He prays and
787 begs until the captain says: "It is good, I shall send water so that
796 the children will have water and veldkost." Then the great captain again accompanies the doctor halfway down. As soon as the doctor is down below, he lets go of the thread which is immediately drawn up. Now the people dance and sing, for the rain has come:

[539] /gá-é dsó-jā /gaa	We rejoice now over the rain.
//ē gà djusā !kho ádshójа /ga	Then we rejoice all together.
//ē gā hin a /gaa /gaa	Then the rain comes.
da //goá dshn !gu da adschŏéa χ'u	Then the people praise the lord.

532]

Fig. 21. Spirits of the Dead and Rain Animal (from Bleek, Rock Paintings in South Africa etc., Pl. 58).

776 Another !Kung said to me: "The great captain in the sky
821 sends the rain and all that comes from above. If he does not want to, everything remains shut up. The rain is opened up above; a great vlei is there. I do not know the name of the great captain. The Hei//om call him Som-seb."

17. Religion

771 After a critical look at the sum of the conceptions determining
177 the religious life of the !Kung, one recognizes, as would naturally be expected in the case of such an ancient people, that the elements

[54 cont.]

171 of various religions have found entry here. Among the Bushmen
177 tribes I visited there is the common belief in a supreme good be-
171 ing, whose name varies. The people described here [55] call the
176 supreme being χ'u, "the lord" or "the great captain" (1). It is

[782]

1. According to Vedder, the supreme being is Huwe (Tsumeb). When the first veld fruits ripen, an offering is brought before sunrise. A freshly broken twig is inserted into a piece of wood with a hole bored through it. The people are seated in a circle, and the eldest passes around a tobacco or dacha pipe made out of a tubular bone.

the same expression that the Cape Hottentot used in speaking to the German traveler Kolbe, with the same significance and pronunciation 705 (2). The name could not have come from the

114
171
176

2. J. Schapera (The Khoisan Peoples of South Africa, 1930) has critically referred to my observations on this point. In this connection I must note: the "great captain" among the eastern !Kung may rightfully be designated as "supreme being." I have already given his characteristics in my earlier publications.

[104]
[194]

The spelling is correctly χ'u. I use χ' to designate a click that is even lower than "!". It is also found in other words, such as χ'Ame = lion. Since not all publishers provide this character, I have sometimes been forced to write "Khu" or "Chu." This word, which the !Kung, too, translate as "lord" or "great captain," was already found, as Schapera indicates, among the Cape Hottentot in 1705 as Khourou = "Supreme Ruler" and "Great Chief" or "Great Captain"; Kolbe gives a quite analogous citation a little later, and Hahn reports of one old Nama, "The people say,

[CONTINUES ON p. 108 - ANALYST]

[55 cont.]

171
776
114

if it is thundering, the Lord (Khub, i.e., Tsui//Goab) is speaking; he is scolding them" [cited in English], Schapera, ibid., p. 381.

The belief in a great captain was therefore common to the !Kung Bushmen and the Cape Hottentot, and the great age of the reports from the Cape exclude the possibility that missionary influence was at work here. Just as among the !Kung, this belief is apparently of very great antiquity among Miss Bleek's Naron and not simply taken over from the Christian Hottentot. In Ovamboland the concept X'u merges with Huwe, and I believe that J. Schapera, too, regards Huwe, Chuwe, and X'u as identical. The fact that the eastern !Kung have the belief in a supreme being was not discovered by me; rather, this discovery was made as early as 1910 by H. Vedder.

[174]

Everyone must be struck by the fact that there is substantial agreement between the reports concerning the heavenly house that I took down among the eastern !Kung and the data that H. Vedder supplies concerning the /Gamab of the Honigkaffir of the Otavi mountains. To be sure, these regions are also close to each other geographically. The question now arises: did the !Kung take this doctrine over from the Honigkaffir, as Schapera appears to assume, or is the reverse the case? Among the Bergdama of the central region, where I was able to carry out extensive studies, especially in the reservation of Okombahe, there is scarcely anything of these conceptions of the Honigkaffir. The Bergdama are a Negro tribe that has completely lost its original culture and language and for a long

[55 cont.]

114
171
776

time had a dependent relationship with the Bushmen, whose quite miserable imitators they had in part become. Even today Bergdama who want to become witch doctors go from Windhoek and Okombahe to the !Kung in order to learn there. If the conceptions of the Honigkaffir reported by H. Vedder were indeed ancient Negro cultural traditions, then it should surely be possible to find parallels and, at least in the names referring to the beyond, traces of the old language. Almost always among the Bantu the world of the beyond lies under the earth, whereas among the Khoisan it is in the sky. For all these reasons, I draw the conclusion that the Honigkaffir have taken over the doctrine of /Gamab from the !Kung. The expression Erob or Elotse, which is to be found among several Bushman tribes, undoubtedly goes back to Christian Hottentot influence. The two-fold names of the supreme being among various groups in Ovamboland, on the other hand, allows one to conclude that here only one new name for a well-known conception found entry, and, to be sure, with such intensity that the Hei//om, at the Etosha Pan, for example, name their most important medicinal root the Erob root. Moreover, just as among the Honigkaffir, among the Hei//om of the Etosha Pan, too, it is /Gamab who sends thunder and lightning and who kills people with shooting stars. J. Schapera recognizes that the conception of Huwe, Thora, and the mantis as creator, as the giver of rain and success in hunting, and as the protector of human beings is common to all Bushmen (ibid., p. 195) and also has its analogue among the Hottentot. He seems to regard this being as a rain god, however.

[177]

[824]

[55 cont.]

114 //Gaua, whose name varies, stands opposite
171 him as an antagonist who does harm to human
776 beings. Schapera believes that the original
[775] designation //Gaua stood for the spirits of the dead. This is largely correct. My researches in various places, however, show that all kinds of noncorporeal beings are understood by the term //Gaua, in other words, spirits in our sense, and immaterial forces of all kind. The great captain, of course, is regarded as actually corporeal by the !Kung. P. W. Schmidt, on the other hand, has regarded this //Gaua as the original god in heaven. A comparison of the facts of the history of religion may support this view.

114 If I understand Schapera correctly, we
776 agree that a benign high deity is indeed pres-
771 ent among the Bushmen, but one that he does not want to designate as the supreme being. I maintain, however, that this being must be so designated in accordance with general usage.
[174] The peoples of the Khoisan group, according to the evidence of the prehistoric finds, have an active history behind them; the most diverse races live on in them, and their culture in its optimal adaptation to environmental conditions is to be regarded as a residual culture. It is therefore self-evident that their world view should have a syncretistic character, especially since religious ideas are cultural elements with definite tendencies to diffuse widely. Like all human beings, the Bushmen and other primitives have thoughts that are fundamentally the same as ours.
[773] Even the Bushman has a distinct need to discover causality, but this need is felt less with regard to causal or conditional explanations for given conditions and more with regard

[55 cont.]

114 to processes. Hence, among the primitives
776 we find carefully thought out conceptions
771 concerning the origin of the world of ani-
773 mals, human beings, and plants more rarely than a clear answer to the question concerning the originator of the actual processes, that is, of rain, storms, sickness, death, and, generally, good and bad fortune in human life. This originator is conceived as either a human-like being above the clouds or ancestral spirits. The religious need or the need for protection is also generally oriented in terms of
114 these two conceptions. The greater the signifi-
771 cance accorded to the benign ancestral spirits
776 and the extent to which they can be influenced by magical practices, the smaller the significance of the heavenly being conceived as a general causa officiens. J. Schapera will doubtless agree with me whan I say that, in contrast to the Bantu, the need for a causal explanation and the religious need for protection are oriented around Thora, Huwe, /Gamab, and others, and that among the Bushmen this heavenly being therefore plays the role that we impute to a "good supreme being." By way of a critique of the Bushmen's conceptions it should be emphasized that the Bushmen, like all primitives, systematize their religious conceptions only to the extent that this is necessary for the satisfaction of their religious and causal-explanatory needs. We shall thus encounter varying degrees of consistency in the world picture from group to group, even from individual to individual, and no investigator will be able to discover a thoroughly organized system of Bushman religion since such does not exist. Whatever I could get from my

[55 cont.] WHATEVER I COULD GET FROM MY
114 individual informants I took down with the
771 exactness of a trained scientist, faithful to
776 the letter and with due regard for all pre-
[124] cautions. From these notations I have drawn the inevitable conclusion that a benign supreme being is a reality in their world picture.

776 surrounding Hei//om tribes, [56] for they use the word Somseb.
171 We should sooner think of Huwe. Huwe or Hue was what the !Kung Bushmen of Tsumeb examined by Vedder called the supreme being. I also know the expression Chuwa from the Bushmen of Ukuambi. This supreme being is conceived of in human form;
776 it looks like a Bushman and also speaks Kung. He lives in the sky
772 in a house that has two floors; his wife, whose name is unknown, lives on the lower floor, as well as many children. The souls
[775] of the deceased live on the upper floor. "The house" (it is supposed to be similar to, but not entirely like a Bushman windscreen) "is hairy on the outside, like a caterpillar." There are various things up there, but only a single house, namely, that of the captain. Honey, crickets, and fat flies are there in great abundance. The great captain lives on them. In addition, there are a great many butterflies. The following are regarded as the
776 functions of this supreme being:

1. In the opinion of some, the great captain made the sun, moon, and everything. In the opinion of others, the highest of the spirits, /Nawa, did this.

2. The great captain calls the doctors to their calling and gives them supernatural power.

3. He is the lord of the rain and the lightning.

4. Through the highest of the spirits he sends luck on the hunt or on the search for veldkost.

5. When someone thinks or speaks ill of him, he punishes
[688] him with lightning. He is not concerned about the other activities of his Bushman children, however, unless someone swears falsely.
695 The Kung have a regular oath, and one of my informants reported
776 the following to me:

When a group goes hunting and one of the participants is

[56 cont.]

695 not seen for the duration of the hunt, he is suspected of having
776 sneaked away. Then he swears by the great captain nu χu, and all believe him.

776 Ordinarily, however, the great captain has everything taken care of by the highest of the spirits and lesser spirits. The chief concern of the Bushmen, therefore, is to stay in the good graces of these spirits, but the great captain does offer protection against all evil spirits, and for that reason people turn to him
[782] with the following prayers in case of severe illness and before the start of a journey:

[57]

[539] χ'u, χ'u hũi mi, //kai tsao mi to 'oba !khu !gaise ≠ani u mĩ /nãna /ge a — Lord, Lord, help me, raise me. "the lord shall lead me well to the place,

!nore gana ti /ge a gana ti tsa /Nane /ã mi tsu (1) — where I am going, and he shall lead me back well, so that I come home safely."

1. Notation of the Dama interpreter.

[224] Before the hunt the doctors pray to the great captain for hunting luck. There is no doubt that the Bushmen conceive of this "great captain" as an all-powerful and at the same time benign being. His executive organ, as has been noted, is the highest of the Gauab. The latter is called "the Gauab" by the common people, but he has a name known only by the doctors, and saying it may have serious consequences. Since I finally
[123] had the honor to be regarded as an equal by the doctors, I learned his name. He is called /Nawa. They were unable to give me an interpretation of this name, but Miss Bleek, from dance songs of the Angola Kung, reports the word /Nwa-se, supposedly an abbreviation for Nwima-se = new moon. According to this, we
[174] might be able to see in this chief Gauab the high god of a lunar-
[771] mythological religion which has been superimposed as a foreign element upon the primitive monotheism of the χ'u or Huwe faith. As is always the case in such matters, the supreme being of the invading religion has been transformed into a more or less evil
[171] principle. It also functions as such in the belief of the Nama and

[57 cont.]

776 Dama, and the translation of Gauab as "devil" comes from this
[171] circle of ideas. A baptized !Kung in /Nuiseb also told me that the Bushmen had been made by the devil, for the latter, as the old doctors reported to me, had once said to things: "You shall
[773] be a kudu, you an eland, you a Bushman," etc., and so everything was. Among the !Kung Bushmen /Nawa is by no means always evil. He directly brings luck on the hunt, and a kind of primitial offering is sent to him in that small pieces of the flesh of the game are thrown into the fire.

/Nawa, however, usually also sends sickness, in part with, and in part without the consent of the great captain. /Nawa is neither in heaven nor on earth, but runs about on threads in the air, where the other small spirits also run about. Whether or not /Nawa
[821] has a wife is unknown. The wind has no role in the tall bush forest, but my experience among the Bushmen of the western Kalahari and the Namib indicates that /Nawa is also connected in some way with the wind, since his most personal appearance is in the violent wind spouts, and among the Naukluft Bushmen one is not supposed to speak ill of the wind because the Gauab would overturn the windscreen.

Aside from /Nawa, there is a whole host of other small spirits, such as those who are at the disposal of the great captain
[821] and /Nawa and live in the sky, where the stars are their campfires. They are the ones who steal the soul from human beings and take it to the great captain. Then there are those who, like /Nawa, run to and fro on threads stretching between heaven and earth. Very evil little spirits live in the water, and the forest and veld are peopled by the little Gauab. These, however, are only the
[775] flesh-born spirits of deceased human beings. And with this we come to

18. Doctrine of the Soul and Belief in Immortality

775 The life principle of human beings is the soul, cha. The
[774] same word also means heart. This cha is immortal. The Gauab who live among the stars take it to the great captain's house. The souls of all peoples, even those of the Whites, live there on the

[57 cont.]
second floor. They do nothing and they eat nothing. According 775
to other Bushmen tribes I visited, the great captain uses these cha
in order to make new human beings, but among my friends of the
bush veld, the dolce far niente on the second floor of the heavenly
house is the final goal of man. The souls of all, the good and
the wicked, come there. There is no punishment in the beyond.

[58] The body is buried in the earth. After a few days the flesh revives and then disappears. The Gauab of the deceased has arisen, comes out of the grave, goes hunting, eats and drinks, and as a shade leads a life similar to that during his lifetime. The grave is his house; the shade (1) goes to sleep there when it is

1. "Living corpse" would perhaps be better than "shade."

tired. These spirits cannot enter into stones, plants, or animals, or transform themselves into such. There is no trace of this true animism. The Gauab is rather a reduced version (since the skeleton remains in the grave) of the once living Bushman. He looks like a Bushman, but many of these Gauab are lame. They are generally malignant, and if someone walks past the grave and [753]
annoys them, they send the little spirits of sickness, who killed [776]
them during their lifetime. These spirits of sickness are thought of as little yellow men with big stomachs.

Among the !Kung Bushmen, then, we have a definite doctrine of two souls. Von Zastrow and Vedder (2) report:

2. Die Buschmänner, p. 421.

"The /Oresen were wicked people. They died, but cannot have any rest. Their wickedness does not let them rest. They always want to inflict harm. This is the way that they behaved in life. This is also what they want to do after death. They torment people, frighten them, and try to kill them. When they have killed people, they eat their flesh. They come at night. The sorcerers can see the evil spirits. The sorcerers then warn the others who cannot see. The /Oresen live in the graves.

[58 cont.]

775 From there they make their rounds. They always return to their
769 graves. Hence, a Bushman always makes a detour around a grave. He does not point at a grave with his finger, and he does not call to a companion: 'There is a grave!' A great detour is made around the area where there is a grave. When a Bushman unexpectedly passes a grave, he puts a stone on it. That is a greeting for the dead person. In so doing, one makes the grave more secure against wild animals."

769 From the region of Foxhof I have the following informa-
775 tion to add:

"The Gauab that arises from the flesh of the corpse remains seated by the grave. When a relative passes by and the Gauab is sitting out in the open, the Gauab thinks: I know this person well; why is he passing by here without giving me any water. Then the Gauab becomes angry and makes him sick. Then when the doctors sing, they recognize what the trouble is and say: Today you passed by the grave of N. and did not give anything. Tomorrow morning very early you must take water and an ostrich egg and place them by the grave. Such a Gauab also
775 goes hunting, kills game, makes a fire, cuts open the game,
787 takes the fat, and brings it to the doctors while they are singing. The Gauab, whom the other people cannot see, sits down at
[756] some distance from the dancers. The doctor sees him, however, and goes to the Gauab. The latter tells him where the game lies, and the doctor tells this to the other people, who fetch the game and praise the Gauab.

775 "The stars are the campfires of the Gauab.

"The Gauana take the souls that they have stolen to their village and then back to the grave. The people often hear a voice in the veld; this is the Gauab calling, and on their way they find a piece of dead game. When the Gauab is out hunting and has gone too far from his grave, he must sleep in a tree. Some of the souls stolen by the Gauab are brought to the captain of the Gauana. The souls that are taken there again become actual persons up above with the captain of the rain. The others, however, are the little Gauab who go hunting here."

[114] The observations made by Bleek (3) 50 years ago seem to
776 be especially significant.

3. W. H. J. Bleek and L.C.Lloyd,

[113]

[58 cont.]

[113] Specimens of Bushmen Folklore, London, 1910-11, pp. 10-13.

776 be especially significant. The !Kung at that time told of a being called /Chue, who transforms itself in turn into various fruit trees and veldkost plants, into a Herero, etc. One day he transformed himself into a //gui tree, his wife ate of it, the tree disappeared, and /Chue changed into a fly. Another time he even became a waterhole, then again a gecko; at night [59] he always changes back into a little human being. The Herero look for him, but cannot find him. /Chue then makes a fire and dies. His father sees this and then moves to his homeland on a large mountain called //Noa. We shall probably not go wrong if we identify this /Chue with Huwe. This Huwe, as is known, is sometimes equated with the great captain X'u. In this old setting he also has distinct traits of Heiseb.

782 The !Kung who were W.H.J. Bleek's informants were also familiar with a prayer song addressed to the new moon. In ac-
[534] companiment, they blew on trumpets made of antelope horns. (Bleek-Lloyd, ibid., p. 15.)

787 The old !Kung called the prophesy sticks /Chu, which evidently is the same name again as that of the great captain and is in agreement with Dornan's report concerning the Masarwa that Modimo himself spoke from the prophesy sticks.

755 Vedder reports that in case of illness a messenger is sent
769 to an ancestor's grave and prays: A dsi-dsi mi !hâ tí /X'ai-a? (Why is my son ill?) ǂnu /kôa (to live in health).

774 While my informants denied the presence of any animistic
825 conceptions, the old !Kung believe that certain snakes, lizards,
775 and antelope found in the vicinity of graves represent spirits of the
171 dead (1), as they do among the Bantu.

1. W.H.J. Bleek and L.C. Lloyd, ibid., p. 430.

[59 cont.]

19. Dance Songs

I was able to take down a few dances:

1. Dance Song for the Wedding

535
539 ee ga ee /nuia khe e /goaro be — We are singing of the child. (Repeat.)

2. Pantomimic Eland Dance

χ'ai /nui !gaa u da !gaa — Runner with arrow poison in his body
ts-ii !gowara //goe — Do you run with a heavy head.

The elephant dance, curiosly enough, is sung with the refrain: "The Ovambo girl goes around between the men."

524 The !Kung also have a war game. Two parties stand facing each other some distance apart and shoot bird arrows at each other. The Bushmen are very skillful in evading these arrows.

622
782
769 Farmer Friedrich near Duwib reported the following to me concerning the Hei//om near Tsintsabis: When the village elder dies, his successor makes an incision on his forehead between the eyebrows and squirts the blood toward the east; then he cuts his little finger and sprays the blood toward the west. This is done so that the dead chief in the beyond will see to it that those remaining behind will always have veldkost.

782
881 At the girls' initiation the spirits of the east and west are imp[illegible]ted in song to let the young woman always find veldkost.

787
695
684 "If after a hunting expedition of several days the husband suspects that his wife has been unfaithful to him, he can clear up the situation by means of an 'ordeal.' He takes a resinous root that burns like a candle with a bright flame, in the evening places it in the entrance of his, that is, his wife's hut, and observes the direction in which the long flame points. If the flame points into the interior of the house, adultery occurred during his absence. If it points outside, his wife is innocent."

[59 cont.]

20. Law

671 The norms of natural law among the Bushmen are the
627 same as among us. The family head is at the same time the supreme judge. Since even the nearest kin group is regarded in a sense as a foreign state, however, the boundaries between law, war, and vengeance are exceedingly fluid. The domain of law, therefore, is actually confined to the family. Since the only
[681] punishment that can be effectively inflicted is the death penalty, it is rarely applied among married men, [60] for the judges and executioners must provide for the condemned man's survivors. In olden times the women condemned to death were burned or beaten to death with the kirri, and the men were killed with the poisoned arrow.

423 The right to personal possession of utilitarian objects, honey, and certain types of veldkost is strictly respected. The soil is common property of the kin group, as is any big game
[224] that is killed. If a wounded animal dies in the domain of the neighboring kin group, the hunter must go there and report it.
[578] The dead prey must then be divided. Since, however, there are some unpaired organs, fighting and killing easily arise concern-
[627] ing them. Blood vengeance is practiced, but can be resolved through negotiation.

423 "Each kin group has a territory that has been inherited
614 from ancient times. The territory is called Gao and might correspond to the German concept Gau [canton, district].

[361] "There are kin groups that are so far apart that a journey of several days lies between them. For example, the territory north of the Omuramba-Owambo near Kajus, where the manketti tree (Ricinodendrum bantaneni) occurs, belongs to a kin group that ordinarily lives over 1,000 [sic] kilometers away and comes there only when the oleaginous fruit is ripe.

"Kin groups with two hunting and gathering regions, come into being through the fusion of two kin groups that have intermarried for so long that fusion came about automatically.

769 "The graves of the ancestors are within the kin group's terri-
614 tory. They are marked by the large piles of stone placed on them. The ancestors are regarded as the guardians of the kin group's

[60 cont.]

769 territory. Hence, departure from the territory must be announced
614 by the chief or an elder at the ancestral grave without special ceremonies; similarly, an announcement must be made there when the kin group again moves into the territory."

423 The property of the kin group, aside from its territory, in-
614 cludes the veldkost, the game, and, above all, the watering place (1).

1. Von Zastrow and Vedder, op. cit., p. 434.

775 As has already been said, the Bushman does not believe
[626] in punishment after death. On the other hand, he is convinced that the evil that he himself has done will befall him or his dogs in the same way.

681 In former times banishment from the kin group was likewise
648 customary, and the exile would soon perish, since the Bushman
177 cannot survive by himself in the wilderness for any length of time. Nowadays, such individuals, just like those who were expelled from the Bantu tribes, move to land owned by Europeans and find work there. It is obvious that they do not help to improve the reputation of the Coloreds.

695 In cases of doubt, the Bushman swears by the great captain: nu X'u.

681 Instead of formal expulsion, the people may boycott out-
762 laws, who are thereby driven to such despair that they commonly commit suicide. Suicides also occur for other reasons.

21. Conflicts with Europeans

648 Before the police zone boundary was erected, the Bushmen found themselves in a latent state of war with their neighbors. Part of their list of sins will be cited here.

According to Toke, the !Kung near Keibeb in 1925 attacked eight Barotse [Lozi] and killed them, and purportedly ate them. Later, three Ovambo were attacked by surprise, killed,

[60 cont.]

648 and their brains eaten. (The latter report probably referred to the people of Karakowisa.) Concerning our !Kung, a farmer wrote at that time (1927):

"Lately, complaints about the slaughtering of cattle stolen by the Bushmen are increasing at a disquieting rate. Only in very rare cases can the culprits be brought to justice. It is true that the police make the greatest effort to do so, but success is rare. In the first place, a single white policeman with a native police assistant cannot do a great deal in view of the great mobility of the Bushmen. He will usually appear on the scene too late to be able to take up the prosecution successfully. The farmers concerned have made all kinds of proposals, which usually amount to the idea that the police and farmers should simultaneously set out after the wandering Bushmen. It would probably be best to draw a clear boundary line for the idle Bushmen, across which they may not pass into the territory inhabited by Whites. That the Bushman knows how to respect boundaries is apparent from the fact that he is careful not to enter the hunting territory of another kin group. Every Bushman caught within such a delimited territory inhabited by Whites [61] should without further ado be arrested and punished by forced labor, which, in view of his holy terror of any kind of work, would probably be most unpleasant to him.

"Under the conditions prevailing at the present time it is primarily the farmers bordering on Bushman territory who suffer to the extent that many of them are seriously considering giving up farming, because otherwise the last head of cattle will be slaughtered within the foreseeable future. The farmer, with his neighbors, should be allowed to follow the trails leading from fresh slaughtering places and, in serious cases, to fire on the Bushmen, just as the Bushman, after all, would use his bow and arrow. The Bushman recognizes no authority; hence he should be placed under extraordinary laws. When, as recently happened here, a strong police patrol spends almost a month to catch cattle thieves, and then the 12 accused, who doubtless were guilty of slaughtering the animals, all have to be acquitted because a witness for the Crown fails to support the case for the prosecution, then it is

[61 cont.]

648 clear that our laws are unsuitable for these Bushmen. One can readily understand that the injured farmer, who in a short period of time has had about 20 head of cattle stolen and eaten, will become desperate in view of the acquittal, since he can well imagine that as a result of the acquittal, the reasons for which the Bushmen do not understand anyway, the latter will be tempted to further acts of depredation."

From the Epukiro region another farmer reports:

"I live not far from the boundary of Bechuanaland. There are a great many vagrant Bushmen here, who are armed with poisoned arrows. These Bushmen frequently attack the cattle of the natives whenever it is any distance from the kraal. A few days ago Bushmen stole and killed two head of cattle belonging to a Herero kraal about six miles from our camp. The Herero followed the trail of the Bushmen and found them. The latter immediately made use of their bows, and one of the Herero was wounded by an arrow on the right side of his chest. The wound was inflicted about four o'clock in the afternoon; about one o'clock in the afternoon of the following day the wounded man died. As soon as my friend learned of the situation, he sent some permanganate of potash to the kraal with directions as to its use. But this seems to have arrived too late. One of the horses was slightly wounded in the head, but it appears to be nothing serious. I saw the corpse of the Herero early in the morning after his death; it was badly swollen and decomposed. The natives said that decomposition set in even before death. -- As will be remembered, three years ago the Gobabis magistrate, Mr. Reyneveldt, was wounded by Bushmen with a poisoned arrow in the same region and died shortly thereafter."

(These data are taken from the Windhuker Zeitung.) [Fig. 21a appears here.]

MASARWA

[62]

Chapter 7

The Bushmen of the North

114 Our best information concerning the Masarwa comes from Dornan (1) and Holub (2). In what follows an outline sketch will

[113] 1. Dornan, Pygrines and Bushmen of the Kalahari, London, 1925.

2. Holub, Die Masarwa.

be given of the culture of this tribe, based upon these two authors.

342 According to Dornan, the Masarwa once preferred to live in caves, where their ancestors had made paintings. The Bushmen in the Wankie and Ngami districts have plaited mats of grass [285] or reed, with which they cover their windscreens. Sometimes they make a kind of roof covered with grass; otherwise they have ordinary windscreens.

[532]
[172]

Fig. 21a. Representation of a Curing Scene. In the background, the female doctor who serves as oracle. (Eastern Cape Province. From J. P. Johnson, The Prehistoric Period in [113] South Africa, 1910.)

322 For the wood of the bow the Masarwa use very straight 411 little tree trunks. After the bark is removed, they are tied to a straight tree and left to dry. The wood is then given its final drying over the fire and is placed in water so that it will not splinter. The middle of the bow is also commonly wound with tendons. The bow is often greased and never unstrung. The finished bow is smoothed with a rough stone.

[62 cont.]

293 Like the prehistoric Bushmen, these people, too, wear forehead bands, into which the arrows are stuck during the hunt.

726 Dornan (p. 139) reports that the Kalahari Bushmen hold
754 dances before the start of a war, and on these occasions they shoot little poisoned arrows from equally small bows in the direction of the enemy or of the sun. They believe that in so doing they are killing the shadow spirit of the enemy. They do not like to give these miniature bows and arrows to anyone because they are afraid that they might come into the possession of their enemies and thus bring about their own deaths.

226 Fishing is still quite well developed among the Masarwa people. Stone walls are sometimes built in the river, in which weir-baskets are set, or they sit in the river bed next to one another with weir-baskets, while women and children drive the fish toward them. In smaller waterholes, grass and brush are piled up on one side. Then the Bushmen step into the water and push the grass wall ahead of them, thus driving the fish into a corner. Individual fish are also speared with the assagai. According to Hodson, the best fishermen are the Bakoba Bushmen on the Okovanggo. They have harpoons and rush nets that are drawn diagonally across the river.

278 G. A. Farini (3) had an opportunity to observe the

[113] 3. G. A. Farini, Durch die Kalahariwüste [Through the Kalahari Desert], Leipzig, 1886.

manufacture of arrow poison in the Chanse Veld. The men gathered at a certain place; women were not allowed to be present. The sap was removed from about 30 to 40 poisonous bulbs by means
[535] of successive incisions and was collected in a pan. As each incision was made, the Bushmen danced in a circle, making a kind of grunt. Then a hyena hide was spread out with the hair side down, and on it was spread the contents of the bags that contained the dried heads of poisonous snakes, as well as two pieces of reed approximately 15 centimeters long. Then a number of freshly killed poisonous snakes were brought. The poison sacs were removed amidst singing and the clapping of hands. Meanwhile the pan containing the poison had been put on the fire and was boiling;

[62 cont.]

278 one person after another stepped up to the pan and threw his share of snake poison into it. Then the pan was removed from the fire. [535] The Bushmen now performed a new dance, in which they imitated the convulsions of animals dying from the poison. After another half hour the poison was clear, and when everyone had convinced himself that it was the right color, a red mineral powder was added and thoroughly stirred into it. Then poisonous spiders were taken out of the reeds and thrown into the [63] pan. These came from the Langen Mountain in the Cape Colony, in other words, had been brought from afar. When the mass had thickened somewhat more, the arrows were smeared with it and dried in the shade (ibid., p. 380).

595 These Bushmen, the M'Kabba, are monogamists.

563 Farini maintains (ibid., p. 171) that he met a black Pygmy who came from the tribe of the Kara-Kara north of Amboland (1).

1. At the mission station Urikualuthi I was told by the missionary, Mrs. Quarni, who has made most meritorious contributions to investigations of the country, that shortly before the war a number of black Pygmies who lived in the swamps along the Kunene had come to Chief Moala. She saw these people.

252 Concerning the food of the Bushmen, Dornan has the following to report: The Marsawa [sic] eat meat either roasted or grilled, rarely boiled, because they believe that the latter will 251 make them sick. The Bushmen of Basutoland cut the meat into tiny pieces, mixed it with fat, and then sewed it into hide sacks as preserved meat. As reserves in case of famine, the Kalahari Bushmen keep giraffe skins on tall trees. Veldkost is stored in turtle shells and ostrich eggs, as is water. The Basutoland Bushmen gathered grass seeds and stored them for times of hunger.

252 The tsama are prepared in the following manner: A hole is dug, and a fire is made in it. As soon as the soil is sufficiently

[63 cont.]

252 hot, the ashes and fire are taken out, the melons are placed in the hot soil, and the glowing ashes are thrown on them. The next morning the tsama are ready.

301 The largest ostrich egg beads are produced by the Masarwa.

Their dance masks are made with pods and cocoons, and
532 sometimes also small hide balls filled with little rattle stones.
535
323 They still know the art of pottery. White or red body painting is
302 customary.

A Bushman tribe at Ngami Lake is supposed to have the
304 custom of removing the last joint of the little finger.

278 Dornan mentions the following medicines of the Masarwa: for black water fever, Anacampseros rhodesica; dysentery, Monsonia ovata and Euclea lanceolata. Other medicines: Cannabis sativa, Solanum nigrum, Lippia asperifolia, Crotalaria burkeana, Pterocarpus angolensis, Datura stramonium, Indigifera senegalensis, Bauhinia reticulata.

752 The Masarwa claim that they can only treat the bite of the puff adder. The body of the Lygosoma sundervalli is charred, and the powder is sprinkled into the wound. Every snake is killed, and
(751) its head crushed. Reportedly there are also inoculations against snakebite.

595 According to Dornan, monogamy prevails among the
836 Masarwa. Sexual intercourse before marriage is prohibited, and
684 incest and adultery are punishable by death. As a rule, the con-
584 sent of the girl is necessary for marriage; it is generally sufficient if the suitor presents his father-in-law with a head of big game. The hunting test is customary only among the Wankie Bushmen
582 and those of Bulalima. One may marry a girl from the same clan. Among those tribes that are totemistically influenced, one may
304 not marry a person of the same totem. Circumcision is practiced.
881 As soon as the boys and girls are about 12 years old, circumcision takes place, for which a stone knife is used. In the case of the girls, the clitoris is pierced with a stone point. Sexual intercourse
(836) between the uncircumcised is strictly prohibited. Occasionally the nasal septum is pierced at the boys' initiation. As among the
761 Bantu, every death is explained as sorcery by human enemies. In
764 olden times the dead were supposedly thrown into the bush;
178 nowadays they are sometimes buried in a crouching position in

[63 cont.]

764 [178] termite hills, sometimes in rock fissures, and commonly Betschuana [Tswana] style, in lateral niche graves. Besides food and water, a man's weapons are put in the grave with him, and for a woman, some ostrich eggs.

776 777 Now for the world view of the Masarwa. As Dornan reports, Thora is the very great one who [64] is above all things. He sends the rain and the game, veldkost and hunting luck. They commonly invoke Thora for luck on the hunt and thank him when they have had it (1).

[113] 1. P. Schebesta, "Die religiösen Anschauungen Südafrikas [The Religious View of South Africa]," Anthropos, XVIII-XIX, 1923-24.

776 [224] [782] Chapman reports that Bushmen who once had killed a rhinoceros sprinkled some dust on the animal's tail and eyes and at the same time murmured words of thanks to Thora.

The Bushmen are not entirely clear as to whether Thora is a spirit or not; in any case they have great respect for him. They believe that Thora makes all things, but they do not know where he lives or whether he is a person. The western tribes primarily use the word Huwe. The Tati, however, also know this word and regard Huwe as a good spirit who keeps away sickness, gives abundant food, and protects the Bushmen in times of danger. They call [782] upon him when in need. The Sansoque say, Huwe ka hume ie ie [539] (Huwe, come and help us). Huwe, however, seems to be weaker than Thora and must turn to him for help. A Bushman song from Thuli goes: Tho-ra ba Hu-we ie ie (Thora, come to the aid of Huwe).

[171] [174] Among many Bushman tribes and also among the Hottentot, an evil principle, "Khauna," is known, a concept that stems from the times when the Bushmen and Hottentot were one people. The [773] Kalahari Bushmen are not certain whether Thora or Khauna made the first human beings.

825 Incidentally, the Kalahari Bushmen believe that men and animals can change their shapes; thus, for example, a person may appear as a leopard. In particular, springboks, baboons, and some snakes are regarded as human beings in another stage of their

[64 cont.]

825 existence. The appearance of the ring-necked snake indicates
[187] misfortune.

Animistic conceptions are more pervasive in the world
774 picture of the Masarwa (2). According to Dornan, each thing is a

821 2. The Kalahari Bushmen (Dornan, op. cit., p. 165) have some knowledge of the stars. The Southern Cross is a giraffe, but the Cape Bushmen regard it as a group of lions. Some of the Bushmen regard the stars as animals or human beings who have gone up to the sky.

773 The following story is told: During the girls' initiation a girl who possessed magical powers nodded to some lions and they were immediately transformed into stars.

The Cape Bushmen told another story: During the girls' initiation a girl was quarreling with her mother because the latter refused to give her certain roots that may not be eaten at such times. The girl seized the roots and the ashes and threw them toward the sky. The roots became stars, the ashes became the Milky Way. -- Shooting stars signify misfortune.

774 kind of spirit. Human beings and animals can each transform
[825] themselves into the other. Individual doctors change into leopards, and many animals are regarded as other appearances of man, especially the springbok, the baboon, and a number of snakes. When a ring-necked snake approaches a village, it indicates
[177] death. Bantu influence is undoubtedly at work here.

The !Kung doctrine of two souls reappears in a different
[184] form among the Masarwa. The shadow of each thing, as well as
774 that of the human being, is its other soul. They believe that the
775 shadow soul remains in the vicinity of the grave, while the self walks in another place where it meets with the fathers. It is supposed to be warm there, and supposedly there is much game. In the beyond one acts the same as on this earth.

MASARWA
OR OVONGGO BUSHMEN

[64 cont.]

000 the beyond one acts the same as on this earth. Like the Namib
769 Bushmen, they throw little stones on the graves and at the same time pray that the spirit of the deceased may bring them luck (Dornan, op. cit., p. 146).

787 Conceptions concerning dreams are tied in with the Lulu
[774] doctrine of conscience. In a dream the other self speaks with the dreamer, and this may be good or bad. The other self may be influenced by enemies and thus do harm to the twin soul.

According to Dornan, the Bantu adopted the oracle sticks from the Bushmen. Every Masarwa carries four or five pieces with him. The female pieces are longer and narrower than the
[825] male pieces. They are made from the hoofs of small mammals,
[824] from wildebeest bones, and fruit kernels. The names of the four sticks are: Chowe, Kao, Daua, Gaichwe. The Masarwa believe
[776] that [65] Thora and Huwe, and perhaps also Khauma, speak through these bones, and Mackenzie (1) states that the Bushmen

[113] 1. Ten Years North of the Orange River, p. 136.

had designated these bones as morimo aa'me (things of God).

The shoulderblade of the springbok is also used for divination by the Masarwa.

606 Among the Masarwa the mother-in-law may not look at
551 her son-in-law and may not mention his name. The wife may say
602 neither the name of her husband nor the names of his relatives.

Finally, concerning the Swamp Bushmen of the Okovonggo
105 delta, J. Seiner reports:
101 "The Tannekwe have summer and winter villages, as well as boats and goats, and engage in agriculture, fishing, and hunting.
[563] The latter occupations are practiced by the pure Bushmen, whereas half-breeds and the pure Mambukuschu, who were stolen as children and reared by the Bushmen, occupy themselves with agriculture and subordinate tasks.

"The number of racially pure Bushmen among the Tannekwe
[144] may be as high as 60 per cent, but as a result of the slight increase of true Bushmen, which they try to equalize by stealing the Mambukuschu children, they are undergoing a steady decrease,
AND RACIAL MIXTURE IS PROGRESSING RAPIDLY.

[65 cont.]

000 and racial mixture is progressing rapidly. The Bugakwe live in
105 five villages with 220 persons in the western Okovanggo Valley
[161] down from the Mahango ford and are in bondage to Libebe, with
101
131 whom, however, they frequently have quarrels over the amount of deliveries; on the occasion of one such dispute in June, 1905, a Mambukuschu was killed by an arrow. The Garikwe live in
[161] eight villages with 430 souls in eastern Ärmellande from the Paliba Swamp to the beginning of the valley, while the Goekwe live in southern Ärmellande west of the river course. Concerning
[161] the latter, I found only a winter village with 90 souls, and that north of the mouth of the Namassere on a river island.

"The Goekwe might well be identical with Passarge's Gokwe, whose territory extends from the western edge of the Tauche swampland deep into the Kaukau Veld; the Tschorilo Mountains belong to them. During the rainy season the Tannekwe undertake hunting expeditions in the neighboring steppes. The Hukwe, whose
[161] number I estimate at at least 600, are less racially mixed than the Tannekwe, but likewise live in settled villages, from which during the dry season they swarm out in family groups to gather or hunt in the forest steppe as the need arises."

Chapter 8

The Nogau Bushmen of Epukiro

During my stay in the mission station of Epukiro, I had an
101 opportunity for closer contact with the Bushmen who live in a kind of symbiosis with the Betschuana (2). They call themselves Nogau,

[113] 2. I have given a detailed report on the Europeanized Betschuana village of Epukiro in Zeitschrift für Ethnologie, Vol. 65 (1933).

specifically ǂno /gna !khou, that is, people who live by the water. They are farther north of the Omuramba Epukiro toward Alexeck.
101
131 North of them are the Gai-kwe, and the !Kung are farther east and

[65 cont.]
101 north. Beyond this there is a great river and many black people
131 (Okawango). They know only the Herero as their western neighbors. In other words, they came much later than the latter. Unquestionably as recently as 20 years ago some people of this group were still settled along the central Omurambo Omatako, where F. Seiner reports them from Otjituo and Nuragas. The Naron live south of them, and to the southeast the ≠Auin. In the southwest, at least formerly, there were Bushmen of the Hei//om group and /Gowanin (Sand Kaffir). Probably these Hei//om were the people formerly designated as Saan. Nogau, ≠Auin, and Naron actually belong to
[101] the Kalahari group. Throughout the farm zone which formerly
[175] extended to the English frontier, the tribal units were more or less
648 destroyed, and there arose a mixed Bushman population which constantly replenished its numbers from the free tribes. On the other hand, however, Bushmen from the farm zone always went back to the bush, partly of their own free will and partly in flight from the police. In the Gobabis district the boundary of the police zone coincides with the land boundary. The relationships between the Whites and the Hereros on the one hand, and the Bushmen on the other, are therefore [66] very tense. A few years ago,
175 after the Bushmen had been prohibited from hunting big game,
648 they rebelled and declared a feud against the magistrate in Gobabis by shooting some arrows against the door of his house one night. The magistrate, Van Rynefeldt, wanted to hunt them down in the bush, but was struck by a poisoned arrow shot from ambush and died. A great roundup of Bushmen was organized and many of them were taken to the prison in Gobabis, where a number of them died as a
[178] result of the vitamin-poor diet. Since then the Bushmen in this region have again chosen a chief and represent a modest power. As a result of these conditions, it was much more difficult to gain
123 their confidence than in the north. In this respect, P. Watterott and the village mayor of Epukiro, Franz Arenat, were especially helpful to me. These Bushmen are of special interest since there
198 is a special women's language among them. It is called Hee-aziba he auseashu. It is in part also spoken by the children and is characterized by having many words that have no clicks. It was only with great difficulty that I was able to take down a few words, for example:

211 [68] The accompanying figures show the incising on messenger staffs, in other words, a kind of picture writing. Von Zastrow and Vedder, op. cit., page 430, observed in this connection:

"Anyone who does not want to go to a friendly kin group
(202) himself, but sends a messenger instead, must give this messenger a messenger staff. It is about as thick as a thumb and bears numerous signs of leaves, worms, caterpillars, pictures of human beings and animals, and other figures. The figures look almost as though they were burned in, but they are made in quite a different fashion. The peeled stick is warmed in the fire, and in the upper layer of wood thus softened the drawings are pricked point by point with an awl or a sharp thorn. When a figure is finished, one uses the core of the ero plum, which, when roasted, is black and can be used as a kind of paint, like a firm mass of fat. The black, oily color is spread over the figure and soaks into the pricked holes. The superfluous color is then wiped off with a soft piece of hide. The Bushmen claim that every friendly kin group knows the different messenger staffs of the chiefs of other friendly kin groups and that forging messenger staffs is a hopeless and impossible undertaking."

Fig. 22-23. The Incising Rolled off the Sticks of the Bushmen (Museum for Ethnology, Hamburg). Cf. also K. Weule, "Botenstäbe bei den Buschmännern. Eine südafrikanisch-australische Parallele [Messenger Staffs among the Bushmen. A South African-Australian Parallel]," Jahrbuch des Museums für Völkerkunde, Leipzig, Vol. 6, 1913-14.

[68 cont.]

142 Racially, these Bushmen are smaller and lighter in color than
144 those of the north and show the admixtures of the southern Bushman race to a much greater degree. There is constant coming and go-
648 ing in this region. Seiner (1) reports the following:

[113]

1. J. Seiner, "Der Verbindungsweg zwischen Deutsch-Südwest-Afrika und der Betschuanalandeisenbahn [The Line of Communication between German Southwest Africa and the Bechuanaland Railway]," Globus, Vol. 96, 1910.

"The Bushmen from around Rietfontein are friendly to the Germans and repeatedly supplied the station garrison with effective help against the Herero and Ovambandjeru passing through. At the time of my stay in January and February, 1907, there was a small village of the Au-nin, who belong to Passarge's Kaukau people, one kilometer north of the barracks, and a village of the Ai-khoe, whom Passarge includes among the Ngami people, one and a half kilometers southwest of the station. The Bushmen of the latter village were subject to the Au-nin, who called them Naru (subordinates, slaves). Since in June, 1908, Dr. Pöch found only Au-nin in Rietfontein, it would seem that the Ai-khoe, in the meantime had emigrated or were driven out by the Au-nin."

To some extent all these tribes represent a cultural unit. A
[184] 114 fine study by First Lieutenant Kaufmann (2) is available for the

[113]

2. Kaufmann, "Die ǂAu-in," Mitteilungen aus den deutschen Schutzgebieten, 1910.

ǂAuin, and one by D.F.Bleek (3) for the Naron. I shall now compare

[113]

3. D.F.Bleek, "The Naron, A Bushman Tribe of the Central Kalahari," Publications of the School of African Life and Language, Cambridge, 1928.

these tribes with one another, and it is to be understood that only the data concerning the Nogau are my own.

[68 cont.]

1. Birth and Childhood

844 Among the ≠Auin, the husband of a woman in childbed slings the string of his bow around her stomach, but he is not present at the birth itself. The cord is severed with the tip of a reed splinter.

844 Among the Naron and Nogau, the delivery proceeds as it does among the !Kung; an old woman usually provides assistance, however.

Twins (Hoi-holi) are not desired; among the Nogau one of them is killed.

845 Among the Nogau, the father gives the child its name.

553] 844 There the child has its umbilical cord severed by means of a sharp quartz splinter. A woman in childbed may not eat blood and head meat. Until the child is able to sit up, the husband

[833] may not cohabit with the mother. The latter custom is also found among the Betschuana. Nogau children are not allowed to eat

262 the flesh of the wildcat and of two birds (tsugnussi and /gui).

[114] Kaufmann has made some observations concerning children's

524 games; Bleek also provides some data:

Among the ≠Auin little bows and arrows serve as children's toys. The same applies to the Naron and Nagau [sic]. Stilts

[481] are known among the Auin and are used by men and boys. Con-

524 cerning children's games among the Naron, Miss Bleek reports:

The Game of the Big Water Snake

A boy crawls on his stomach to a small pile of sand which is supposed to represent the waterhole. At some distance from it, the children sit in a row, one behind the other, in such a way that each one sits between the legs of the one behind him; he puts his hands on the shoulder of the person in front of him. The biggest child [69] always sits at the front, the smallest at the back. They sing a song that in part is no longer intelligible. (Probably in the children's language.) This big "snake" now moves very slowly around the waterhole, while the water snake from time to time throws sand on it; then the others withdraw. At the end the snake catches one from the row and "eats it." I

[69 cont.] I
524 have observed an analogous game among the Betschuana children
[171] in Epukiro.

The Elephant-Ostrich Game

Again a pile of sand serves as a substitute for a waterhole. Two boys come as elephants and want to drink. Two others imitate ostriches and will not let the elephants get water.

The Oxen Game

Three or four boys represent the oxen. One is regarded as the owner; another wants to steal them. After a little struggle, he gradually succeeds in doing so. Once he has stolen all of them, the game
[532] is over. (Compare the "ox stealing" among the Bergdama from Okombahe.) [Fig. 24 appears here.]

Fig. 24. Magical Contact between Hunters and Game (Salt River Valley, Kaofeld). From H. Obermaier and H. Kühn, Buschmannkunst [Bushman Art].

[69 cont.]

The Bartering Game

524 It is exactly like analogous games in Europe.

The War Game

The boys stand in two rows facing each other and play at shooting arrows. The one shot at tries to protect himself. As soon as he becomes tired, he falls over as a "dead person." The game is played until only one is left.

The Bride-Stealing Game

Two young girls dance behind a bush. They are the brides. Two older girls with sticks follow their trail; they are the suitors who try to catch the two brides. When they have succeeded, two more girls representing the mothers appear, and they try to prevent the abduction of the brides. Finally, however, the brides are abducted anyway.

The Ball Game

The ball game is definitely a women's game, in which small girls and grandmothers alike participate. The players stand in two rows facing each other, and the ball, usually a round watermelon, is thrown from one row to the other.

2. The Boys' Initiation

881 Among the Nogau, the boys are initiated when they reach maturity. The boys' initiation is called Dschai-dschua.

The young man is not accepted into the community of men simply through marriage. He must first submit to the initiation, which proceeds as follows among the Nogau:

Under the leadership of an experienced elder and several

[69 cont.]
assistants, the boys go into the bush. On the first day two vertical incisions are made on the forehead; then they sing throughout the night and dance to the melody: "Ije, ije, aije, aije . . . oho, oho," etc.

881 [539]

On the morning of the second day, the incisions on the forehead are extended to the root of the nose and the hairline. On the afternoon of this day the elders call the youths together to look for veldkost. The elder loosens the roots with his digging stick, and as he does so the candidates place their hands on the arm doing the work. The boys must then dig the roots out of the ground with their hands, without the help of tools. "From now on they can look for veldkost themselves, for now they have been taught."

[304]

After this lesson they return to the place where the women are. [70] Food is prepared there for both the men and the candidates; the candidates are allowed to eat only veldkost, no meat. Then they dance, together with the women and girls, for a night and half a day.

In the afternoon the candidates go hunting. They must bag three animals: a small duiker, a guinea fowl, and a bullfrog. They take their prey and assemble with the older instructors at a remote place, the three kinds of meat are cooked together, the meat is eaten by the elders, and the bodies of the boys are washed all over with the soup. From now on they may eat the three animals, hitherto forbidden to them. Now they again dance and sing: "Oouu, oouu, oouu, oouu, oouu" (long drawn-out).

[262] [539]

ǂAuin: The candidates from neighboring villages go into the bush under the leadership of the doctor, and they live there on veldkost for a few weeks. During this time they receive instructions in secret matters. Kaufmann reports the following dance: A boy gets up on the back of another, and both of them wrap themselves in a large hide mantle. The dance consists of the carrier swinging from one leg to the other as rapidly as possible without moving forward, and both of them yell "hu, hu." They actually attain manhood, which gives them the right to marry, only through the hunting test. Tattooing is not connected with the declaration of manhood.

881 [535] [304]

NARON
FAUIN
NOGAU

[70 cont.]

881 Among the Naron, on the other hand, they must first pass the hunting test before they are admitted to the boys' initiation. Ten or 12 candidates are taken into the bush and must live for a month on veldkost, which is sprinkled with a medicine by the doctor before it is eaten. Women are not allowed to come near the camp.

During one of the nocturnal dances, Hise appears, dances [776] around the circle, and is then driven away by the medicine man. (787) Some say Hise looks like a woman; others describe him as a be- 535 ing three feet tall, with a flat head, large eyes, black body, 881 wings and claws (one is reminded of the spirit bird Engororí, which appears at the initiation of the Ovambo, or of the Neida Gamaseb of the Bergdama).

Some old ǂAuin saw two beings, one male and one female, 787 who looked like lions but walked upright; they were followed by children who looked like baboons.

Evidently masked dances, are involved here. The younger 535 men no longer see this Hise; the doctors explain to them that he 881 came, but could only be seen by the medicine men.

A special dance for Hise is an imitation of a bird's movements. In olden times the people also danced in pairs, while they sang in refrain: "Ostrich stomach, Hise stomach, hu, hu, hu."

The /Di dance is likewise dedicated to Hise. At this dance the men wear the dance rattles described above, as is also done for profane dances, but in addition they wear white or black ostrich feathers.

3. The Girls' Initiation

Among the Nogau when a girl has her first menstruation, 881 there is a celebration. Throughout the first day the girl must stay [343] in a closed, arbor-like pontok especially constructed for her. She is only given something to drink, nothing to eat. The women gather from far and near and perform dances around this arbor. These festivities last for five days, and only one man is present as a leader of the ceremony. During these five days the girl is regarded as "poisonous" and may not touch anything, not even

[70 cont.]
her food, which is given to her by an old woman. On the sixth day
881 the girl goes looking for veldkost with an old woman, and, when she has returned, she herself makes the fire and cooks the food in the circle of her guests, for the first time officially independent.
(582) Girls may marry even before this ceremony.

[71] Among the ≠Auin the initiation is held for each girl
881 at the time of the first menstruation. The same is true among the Naron. The eland bull dance is performed every night during
881 the girl's period. Two old men attach real or wooden eland
535 horns to their heads and wait in the bush. Then the menstruating girl comes and sits down or lies down surrounded by old women, in the center of a circle of younger women who stage a dance. The two eland bulls soon appear and then quickly disappear again. The dance is very indecent. Among the Nussan, men masked as birds (!) take the place of the eland bulls.

796 Once a year, in autumn when the veldkost is harvested, there is a great festival. The day is called: "//gam gna she (the great day)." On this occasion food is prepared, and the Bushmen come from all sides. They dance and sing, but they are supposed to stay at home; no one may hunt, look for veldkost, or do any kind of work. [Fig. 25 appears here.]

4. Courtship, Wedding, and Marriage

If a young Bushman wants to marry, he does not go to the girl, but instead must speak with her parents; at the same time
584 the girl's consent to the marriage is necessary. Once this consent is given, presents are exchanged between the parents of the engaged couple, or a gemsbok is shot and divided between the two families. Immediately after the presents have been exchanged, preparations for the wedding are begun. If enough game, above all, a gemsbok, is at hand, they dance through the
[539] entire night and sing: "Ueeõ, ueeeõ, õ, eee, gueeõ, guueeõ," etc.

Then the young man takes his wife and moves to the horde
581 of his father. Great importance is attached to virginity before
[591] marriage. "It simply does not happen among us that a girl

NAROON
≠AUIN
NOGAU

[71 cont.]

581 becomes pregnant before marriage," at least so the chief of the horde assured me. Similarly, great importance is attached to off-
[842] spring in marriage. There are no food prohibitions during preg-
843 nancy. When the confinement is near, all the women of the horde
845 gather. In case of difficulties, no help is given except a medicine.

611 The father's eldest brother is the family head. The boys be-
596 long to the father, the girls to the mother, and they also belong to the families concerned. The kinship terms for the closest rela-
601 tives are: father, mba; father's brother and family head, mzu; the latter's wife, mama (the children of father's brothers and father's sisters are called siblings, and marriage between them is forbidden); mother, aje; mother's brother, mko; the latter's wife,
582 tsoo. Unlike the !Kung, marriage is forbidden even with the children of the mother's brothers and mother's sisters; within the individual kin groups strict
595 exogamy prevails. Monogamy is the rule, but, as among the !Kung, a man may take a second wife provided he has the consent of the first.

[301
789
303]

Fig. 25. Girl's Necklace with Magic Sticks and Perfume Box (Nogau).

586 Marriage is indissoluble. The woman's family cares for the widow,
736 who, with her children, goes to her relatives. There is no obliga-
587 tion on the part of the brother-in-law to marry his widowed sister-in-law or to support her.

≠Auin: Men marry when they are about 16 to 18 years old,
582 girls between 13 and 16 years of age. Both statements, of course,
584 are estimates. The suitor goes [72] to the girl's mother. If she is no longer living, the nearest relatives (father, uncle, aunt) take her place. The father is only the second to be asked. The suitor

[72 cont.] The SUITOR

584 brings his future parents-in-law presents in the form of game and
[583] veldkost, sometimes for more than a year. If matters go smoothly,
[585] he takes the girl to his hut after a while, and the marriage is regarded as concluded. If, in spite of her parents' consent, the girl refuses to marry the man (she is entitled to state her wishes and by no means always follows her parents' desires), the young man finally takes the girl forcibly into his hut. Should a man do vio-
684 lence to a girl without the consent of her parents, he would be

301

Fig. 26. Nagau Girl in Festive Finery of Ostrich Egg Beads (Girls' Initiation).

killed. There are no special ceremonies when the marriage is
585 concluded. The engagement, undertaken before the couple settles in the man's pontok, is regarded as concluded when the man seizes the girl around her wrist. Since, however, the "engagement" and "wedding" are separated in time only by the walk to the hut, the grasping of the bride's lower arm may be regarded as concluding the marriage. [Fig. 26 appears here.] The seizing of the lower arm is done rather violently, and on the walk to the hut the bride allows herself to be dragged along to a certain extent.
606 It is curious to note how the relationship of the son-in-law to his mother-in-law changes after the marriage. The former avoids his mother-in-law's company and does not sit with her. For example, when he approaches the campfire with the obvious intention of sitting down in front of it, the mother-in-law goes away. If it is absolutely necessary for him to discuss something with her, they yell at each other from a great distance.

836 Premarital sexual intercourse scarcely seems to occur.
163 Kaufmann observed that most of the women had two or three

[72 cont.]

163 children, who are always approximately two or three years apart.

Among the Naron the bride is formally abducted; the word
585 for "to marry" is the same as "to catch." Actually, however,
[583] negotiations precede this abduction. Among the Naron exogamy
582 now applies only to actual siblings. After the wedding the young
591 couple moves to the village of the bride's parents and sometimes stays there for years. There is also infanticide among the Naron.
847 Otherwise, however, the Bushmen are greatly attached to their
855 children.

5. State and Law

Among the ≠Auin, the chief's position is hereditary in the
622 man's tribe. The same is true among the Nogau. Among the
[178] Naron there are no actual chiefs any more. The last one lost his authority by staying on the farms most of the time as a worker. Bleek believes that formerly such a chief ruled 30 to 50 families.
[701] In most recent times all these tribes had a war chief, at least nominally.

422 Among all three tribes the conception of private ownership
685 of utilitarian objects is very strongly developed, and theft is punishable by death. Every kin group has a certain territorial district. The boundary markers are not clearly defined everywhere
423 in this flat terrain, so that crossing them does not have the same serious consequences as it does in the north. On the other hand, a person who finds game that was killed by arrow poison but not shot by him, may not take any of it. The gathering of veldkost is permitted everywhere. A person who finds a stock of honey, on the other hand, makes a sign there, and it is henceforth his private
[222] property. Among the ≠Auin individual Bushmen burn parts of the
[425] veld, and all the veldkost that grows there is regarded as the individual's private property.

The feuds between individual kin groups are designated as
628 wars, but since legal revenge is practiced almost exclusively
721 against members of other hordes, every [73] enforcement of the law at the same time means war. Among the Nogau, war is ceremoniously announced by messengers.

I AUIN
NARON
NOGAU

[73 cont.]

726 Before going to war, the body is smeared with a magic medicine (/num). If old enemies are involved, the attack is carried out by subterfuge and stealth. Otherwise the opponents face each other in open battle. Depending upon the degree of enmity, they shoot at each other with either poisoned or unpoisoned arrows. Commonly, however, a conference of the leaders takes place before the beginning of the battle, which leads to a peaceful dispersal of the combatants. The principles of natural morality are honored and recognized both within and outside the horde. It is regarded as bad to inflict harm on another person or not to assist him if he is in need, not because any kind of punishment is to be feared, but because this is what elders have taught.

6. The World Picture and Religion

821 The sun is a man and is called /gam or kha//ã̃, the hunter. The moon is a woman and is called !nui or /nauga, "the one who runs around."

773 821 Formerly the sun, the moon, and the hare lived together. One day Mrs. Moon and Mr. Hare were having a quarrel. The moon split open the hare's snout with an ax. The hare then scratched the moon's face. This is still visible today. When the sun came home, he became angry and said: "Now we have had enough of the earth; now we shall go up so that the hare will be alone. I shall burn him from above, and I shall become very hot so that during the day he cannot run about as he wants to." The moon replied: "That is a good idea; at night I shall go and bring the cold, so that the hare will freeze when he looks for his food."

Since that time, the sun and moon are in the firmanent.

The dome of the sky is the covering of the sun and moon. When the sun and moon went up to the sky, they had little sacks of resin with them. They threw them away. The grains of resin are now the stars.

When the sun, moon, and hare were still together, the sun said, "Men shall not die," and the moon agreed with him. But the hare said: "No, people must die, because I, too, must die."

776 821 Rain is made by sorcerers; these are called Gowa. They do

[73 cont.]

776 821 not die, but otherwise they are like people, except that they have black skin. When there is no rain, the Bushmen make a large [789] fire and throw into it a root, "he," and a male turtle. As soon [535] as it starts to rain, they dance, strike themselves on the thighs, [534] and sing: "Ehe, ehe, ehe, ije, ije, ije, ehe, ehe, ehe," etc. The sorcerers can transform themselves into lions.

The rain sorcerer lives on earth as other people do. The rainbow is the rain dog. The clouds are the rain hairs.

At the time of new moon, they say the moon is sleeping. During the night the sun runs back to the east.

Thunder and lightning are not made by the rain, but by Gauab who among these Bushmen has become a personification of evil. Lightning is called "Gauab's knife."

The dark night sky is the covering of the moon and sun. The dome of the sky is called /gna. My informants left it an open question as to whether the sun perhaps "might be the greatest," the one who has made everything. On the other hand, Khu is likewise regarded as the creator. He made heaven and earth, and he also made human beings live. Khu is not a human being; he is good, but nothing more is known about him. He does not interfere in the course of the world and of human life. To be sure, they say, "Khu is the greatest, and Gauab is the smallest," but nonetheless Gauab plays a larger role in their lives. He controls thunder and lightning, he races over the steppe as a destructive wind spout, visible to all, and he also kills people by tearing out their souls and making a little Gauab out of them. This little Gauab in turn runs about in the bush and does all kinds of evil things.

[74] There is a secret moon cult among the Naron. They 794 pray to the new moon for rain. In olden times certain stars, espe- 787 cially the morning star and the Southern Cross, which they call 821 "fire shoe," are also supposed to have been invoked. The story of 773 the moon and the hare is told in the following way: The moon 821 said: "People must die and arise again, just as I die and return again." But the hare contradicted her and said that people should remain dead. The moon then became angry and cut the hare's mouth with a hoe.

"The moon is an old man, and the sun a young girl, his wife. First the moon goes under the sky, and then the sun follows behind

[74 cont.]

773 him. They go to their huts which are under the horizon in the
8 21 west. At night or during the day, respectively, they go back to their huts in the east; one can hear them but cannot see them."

114 776 Kaufmann was unable to discover anything concrete concerning the high gods of the ≠Auin. Concerning the Naron, Bleek
776 relates that a curious mixture of religious conceptions has come about. A central position is occupied by Hise or Hyesa, who is designated as !Khuba or !Xuba by the adult men. The old people knew nothing about this. The Nama designate !Khub as master or lord, and this word is used by a number of missionaries for Christ. These elders maintain that this concept has been adopted
[177] from the Nama. Formerly they only knew Hise, who lived in the east. Hise is evidently the same as Heitsi Aibib (literally, "the first tree").

The Naron relate that in olden times both the trees and the
773 animals were human beings who were transformed by Hise into their present shapes. Then Hise called the chiefs of the Whites and Blacks and said to them: "Take cows and goats and live with them." But to the first chiefs of the Bushmen he said: "Take the antelopes and live on them; make traps and hunt and live in the bush."

The expression Huwu or Huwuba is known and is supposed to
776 designate the great captain of the men in the north. The details given by Miss Bleek concerning //Gauwa are interesting. In the opinion of the Naron and ≠Auin, //Gauwa is the spirit of a de-
[775] ceased person. Medicine men can also see these spirits; the
[787] women can only hear them. Many a woman declared that only men who had gone through the initiation ceremony and who have two scars between the eyebrows can become //Gauwa. A strong, howling wind is also designated as //Gauwa, however. A few individuals also believe in a chief spirit by this name, who lives near Hise in the east and to whose house the spirits return by day. Some designate //Gauwa as the younger brother of Hise; others identify him with the latter.

The Naron put both masculine and feminine endings on the word Hise. Among the ≠Auin he appears during their dances at

≠AUIN
NARON
NOGAU

[74 cont.]

776 one time as a man and at another time as a woman.

7. Medicine

The curing practices of the Nogau Bushmen are very primi-
759 tive. They have nothing for snakebite and nothing for arrow poison.

Eland fat is a universal medicine. For the common eye
278 inflammations this fat is smeared into the eye; for headaches warm eland fat is dripped into the ear; for a cold the nostrils and nose are smeared with eland fat.

Sickness comes either from the evil head Gauab or from
753 sorcerers. The ailment is caused by a little Gauab who has settled
[754] in the body. The more gravely ill a person is, the more Gauana have entered into him. The doctors are able to draw out these
755 spirits of sickness; they do it in a fashion analogous to that prac-
756 ticed by the !Kung. There are also female doctors.

The spirits of sickness are regarded here as much more ma-
753 terial than among the !Kung; such a Gauab looks like a human
776 being, but he may also appear as a lion, a wildebeest, or a snake. Once the Gauab has been drawn out of the body, it runs away and speaks to no one.

The sorcerers in particular like to transform themselves into
756 lions. Among the Bushmen farther north [75] it is supposedly
[825] the case that when they see a wildebeest in the bush, for example, it is not a wildebeest at all, but a Gauab. The doctors receive their power from the highest Gauab (/gaua //gaicha). He is the one who appears in the wind spouts. As among the Bantu, the doctors must go to school for several years with older colleagues.
[754] They are not only able to cure, but also to practice magic in the bad sense, in that they induce /Gaua //gaicha to make ill anyone whom they want to harm.

"Whoever wants to become a sorcerer must go to school with another witch doctor. When someone is struck by lightning, it is said that Gauab struck him down with his knife. Some then become great doctors and often speak with Gauab. Gauab also comes as a wind spout."

[75 cont.]

Among the Naron, according to Miss Bleek, the Bushman
754 revolver is also in use. The doctors fight one another with it.
411 Such an arrow is secretly shot at the opponent's kaross, and through the magic emanating from the arrow, the enemy falls sick and dies.

8. Death and Burial

The Nogau have the following conceptions: Death is
761 caused by Gauab, who steals the soul and makes a little Gauab of it. The dead person is buried immediately; there is no
764 dancing, only weeping. The corpse is tied in a crouching position and buried on its side with the head toward the east. Only the sleeping blanket is placed in the grave; the weapons that were left behind are kept by the brothers. The food that the deceased was carrying with him is thrown on the grave. Then bushes are placed on it.

(775) In their opinion the soul of the deceased, which has been
769 transformed into a Gauab, wanders around near the grave; therefore they detour around it. When a Nogau Bushman passes the grave of a tribal member, he prays to him for help in hunting so that the children will grow fast and become fat. He says:

"I do not know how it will go with me
[539] With the food, how it will go with me with the food;
I do not know what I should do to get something to eat,
Let us eat and become big."

On the other hand, there is also the belief that the great
775 Gauab who kills a human being eats the heart or keeps it in cold water and finally makes a new Bushman of it. Among the Naron
764 the corpse is tied in a crouching position and buried on his side with the face toward the east. These customs are by no means always observed, however, especially when the ground is hard.
769 The Naron do not fear the spirits of the dead, although the doctors
787 see them, as do those men "who have incisions between the eyebrows." As we know from the Nogau, this includes all who have taken part in the boys' initiation. Women can never see such spirits.

Among all three tribes, old people are exposed to die.

888

[75 cont.]

9. Hunting

224 Even today the western Kalahari has fairly abundant game, and life can be maintained at least to some extent by hunting. Before going to hunt, a tamana fruit (tse) is rubbed on the face. They also try to absorb the powers of the game by means of inoculation. For example, when a duiker has been killed, little pieces of the heart and ear are charred. This animal charcoal is then rubbed into an incision on the upper arm. Both in war and
[202] hunting, people communicate by means of smoke signals. The chief hunting weapon [76] is the bow with the poisoned arrow.
278 The poison (1) is obtained from the cocoons of a beetle larva that

[113]

1. Lewin has devoted several studies to Bushman poisons ("Pfeilgifte der Buschmänner [Arrow Poisons of the Bushmen]," Zeitschrift für Ethnologie, Vol. 44, 1912).

"When I was permitted to examine the first arrows armed with poison that Lichtenstein had brought home from his journey in the year 1806 and which are kept in the Museum for Ethnology here, I was able to establish that there is alkaloid in the poison, which initially had stimulating, and later paralyzing effects on spine and brain. Because of the small quantity of the material, nothing further could be determined, except for a curious color reaction that the alkaloid isolated from the poison produced with concentrated sulphuric acid.

"I have now succeeded in producing from the bulb of Haemanthus toxicarius, the 'poison bulb' of the old Dutch colonists, the most active ingredient, an alkaloid which chemically and toxically

[76 cont.]

278

corresponds to the active ingredient of the poison taken from the arrow. I gave it the name Haemanthin.

"After the subcutaneous injection of animals with the water soluble albumin isolated from Blepharida larvae six to seven milimeters long, disturbances of movement set in fairly rapidly. Food is no longer taken. It makes doves vomit, and, like rabbits, they also get diarrhea. They become quiet, they huddle motionless, and their eyelids, which for a time move almost ceaselessly, finally are affected by the lethargy or inability to move. The eyes are closed. The animals then fall into a sleep-like state and perish, but commonly only after many hours of difficult breathing. Dissection shows changes in the kidney."

A survey of the poisonous plants of South Africa has been supplied by J. M. Watt. In South Africa over five hundred species are used as medicinal plants, and 150 are regarded as dangerous poisonous plants. Most of the poisonous plants known to date have an effect like digitalis. The old arrow-poison plants of the Bushmen, Acokanthera venenata and A. spectabilis, which have been examined in greater detail by Moir, Lewis, and Curson, also belong to this category. It is striking that the poison has an extraordinary chemical and physical stability. For poisoning per os, Boweia volubilis is commonly used by the natives.

278 lives on the roots of an acacia. The Bushman carries several of these cocoons around with him, like cartridges, in an antelope horn. If the arrow tip is to be poisoned, a fire is made, some of the acacia resin that the Bushman always carries is smeared on the arrow tip, and then a cocoon is broken and its contents rubbed on the tip. On one occasion one of my Bushmen had overlooked a small wound on his thumb, through which the poison penetrated into his blood stream. The penetration of the poison was not very painful; he merely had a feeling "as though warm water was penetrating into his flesh." The arm was considerably swollen for a week. The others made numerous incisions and scarifications with glowing sticks on him in order to save him. [752] [262] The flesh of the animal killed in this way is eaten raw, poisonous.

278 Von François (2) reports that the Hei//om of this region

[113]

2. Von François, "Reiseberichte Windhuk-Gobabis [Travel Report, Windhoek-Gobabis]," Mitteilungen aus den deutschen Schutzgebieten, V., 1892.

prepare their poison from the milky sap of the Apocynacea adenium Boehmianum. When exposed to the sun, it first becomes violet and then black. It is kept in little leather sacks and in case of need is warmed and mixed with the sap of the Habas root and applied to the arrow tips with flat sticks. These Bushmen still [411] used grooved stones to direct the arrow shaft.

[76 cont.]

411 The little bow (!naru) is made from the //ne bush and is
[192] much shorter than that of the !Kung. The arrow and the arrow point are called tschi. They have arrows with iron points like the !Kung, as well as others made of bone. The accompanying figures show the two types, which have already been sufficiently described by other authors. The arrow points found in older collections, on which the poison is applied not only at the tip but also in lines or dots of little lumps on the contact piece, are now no longer in use. The bows of the Naron are also small, and they likewise have two kinds of arrows. The arrow shafts are made of reed, which is used only in a few places. In addition, all these tribes have root-stock clubs. Spears (kuku) are bartered
[435] from the Ovambo in exchange for ostrich egg beads. Bleek
231 writes [77] of the Naron that formerly they had no dogs at all, and Kaufmann reports that the ≠Auin have very few dogs. The Nogau had all kinds of mongrels, but none of any peculiar strain. Two animal stories should be told in this connection:

539 1. A large bird killed a duiker. Then the hyena came and took the duiker. The hyena met the jackal. The jackal said: "Hyena, you should not go where you want to go, otherwise bad things will happen to you!" But the hyena went anyway, and the great bird (!gui) came and tied the hyena's feet together and made a fire by its feet. Since then the hyena has black legs and dares not kill anything living. But the jackal also went stealing, whereupon the great bird seized him and held him with his back to the fire; since then it has a black stripe across its back.

2. The lion came to the watering place; then the frog came out of the water and mocked the lion. The latter wanted to kill the frog, but only scratched it on its back; the frog quickly jumped into the water again, but since then it has black stripes on its back. [Fig. 27 appears here.]

10. Clothing and Ornaments

291 The clothing of the man consists of the cap, made from the hide of the jackal, the jumping hare, or the duiker, and the loincloth, sandals, and the hide bag. In general the clothing of these Bushmen is not essentially different from that of the Bushmen

[77 cont.]

291 [301] in the north, but they have far more ostrich egg pearls.

11. Weapons

The ≠Auin have the throwing lance; the digging stick is
411 occasionally also used for striking and as a throwing club. The
[439] lance points are bartered from Ngami Lake. The upper end of the shaft is bound with a strip of antelope skin or tendons. The shaft tapers off toward the end. The lance points are distinguished as male and female. The male points have blunt barbs. The points are often provided with a leather cap. The lance points also serve as a knife and universal instrument. The spear points are kept well hidden. Among the Naron, spears
411 439 are very rare today; they are obtained from Ovamboland in exchange for chains of ostrich egg beads. The same is true of the Nogau, who, however, obtain their spear points in part from the Ovambo and in part from the Okawango by way of the !Kung.

The bow of the ≠Auin is small;
411 the string is twisted out of animal
[283] tendons and is pushed up on one side and fastened on the other. The arrows are made of reed. At the bottom of the shaft there is a shallow notch, and the end is wound with grass. Similarly, we find a notch at the upper end where the point is inserted. The length of the arrow shaft is from 48 to 52 centimeters. The points are made either of iron or bone; in the latter case ostrich bones are used. The bone arrowhead is pointed at both ends, one of which is inserted

Fig. 27. Arrows of the Nogau.

[77 cont.]

411 into the reed shaft while the other is poisoned. In other cases, the short arrowhead is joined to a bone spindle by means of a connecting piece made of grass, and this bone spindle is in turn fixed into the shaft so that the arrow is tripartite. The arrows are either carried in the quiver already assembled, or the points [78] are kept in small containers of bark or horn closed off at both ends by leather caps. Three bows of the Nogau had lengths [411] of 89, 95, and 100 centimeters. Animal tendons are used.

The battle insigne of the ≠Auin is a war cap made from the [714] hide of the aardwolf. The bow of the Naron is made of Grevia 411 wood and is about a meter long. Not only tendons but also plant fibers are used for the bowstring. The plant strings are a surrogate that the Bushmen are forced to use today due to the lack of game. The bow itself is reinforced at the ends with a binding of tendons or leather.

The arrow shafts resemble those of the ≠Auin, as do the points. The iron points are not removable and are called male. The metal is obtained from the north and is worked cold by the [325] ≠Auin. The Naron themselves make no iron arrowheads. [Fig. 28 appears here.]

Whereas during Kaufmann's time the ≠Auin did not have the kirri, the Naron have it today; its lower end is sharpened to a point so that it can also be used as a digging stick. The Nogau, though not too commonly, have throwing clubs that [411] correspond to those of the Dama and Herero, but are more crudely worked.

Concerning the Naron, Bleek also mentions harpoons with long, composite shafts, which serve to get jumping hares and the like out of their holes. This tool will be described in greater detail under the Dama [untranslated].

Like all Bushmen, the Nogau make fire by rubbing two 372 sticks together. The female stick is called Dane-di, the male Dane-≠goa. Firemaking itself is designated as Dalisi, one of the many strange words without clicks that we find among the Nogau.

Bushman wells are likewise used and are called //a-si.

312 The girls have a toy (gai-dum) consisting of several sticks of various kinds, which they wear on the chest. They drum on 524 IT WITH THE FINGERS.

[78 cont.]

000 it with the fingers. [Fig. 29 appears here.]

224 [79] The lion is neither eaten nor hunted. The jackal and
262 leopard are eaten, as is the liver of the latter. Baboons are not
825 eaten, because they were formerly Bushmen.

304 The line of tattooing between the eyebrows make people
302 into leopards among the Nogau. The Naron smear themselves with red and black color. The other incisions and tattooing are made purely for adornment.

825 Among the Naron, millepedes are regarded as creatures
756 of Hise, and only doctors may touch them and make medicine of them. Among the Nogau and ǂAuin there are magical bones
787 that are used to predict the future. The Naron also believe that
[172] the rock engravings stem from //gauwa.

Among the Auin it is forbidden to eat hyena flesh, and
262 likewise the flesh of the shabrack jackal because it is a dog.

The following important data supplied by Gentz (1) should

224
[114]
[113]

1. "Einige Beiträge zur Kenntnis der südwestafrikanischen Völkerschaften [Some Contributions to Knowledge of the Southwest African Tribes]," Globus, Vol. 83, 1903.

be added:

"I have repeatedly found Bushman arrows on which the point, usually made of bone (for the most part ostrich bone), was made of wood. The game sling, reproduced in Figure 29, is constructed as follows: A strong string, four to five millimeters thick, which at one end terminates in a simple loop, is fastened at the other end to a flexible young tree or branch that is bent far over. A small, thinner string with a transverse stick is attached at the loop end. The string is placed around a small post driven into the ground at an angle, and it is prevented from slipping off by means of a flat piece of wood buried under the ground and planted against the free end of the transverse stick; the sling is placed in a circle on the ground over the flat piece of wood. The game, which follows its customary track to the

[79 cont.]

224 water or Brak (salt) place and is prevented from turning off the track by thorn branches placed on either side of the worn track, steps on the little stick lying just below the ground, which moves it out of position and releases the end of the little transverse stick. The string, having lost its hold, releases the bent tree, which snapping back, tightens the noose around the leg of the game and holds the animal imprisoned until the Bushman brutally kills it with a number of blows of his kirri, which is carved out of hard
223 wood. For various kinds of fowl, doves, etc., the Bushman prepares similar slings with thinner string, which are set up in the same way except that the sling is not placed on the ground but is held two or three centimeters above the ground by means of little sticks planted in a circle. In the center of the circle, on a little stick loosely covered with sand, there are a few maize kernels or berries. When the bird picks them up, he moves the little stick out of position and finds his neck in the sling. -- As household
415 implements among the Kalahari Bushmen, in addition to the hollow
237 ostrich eggs used to carry water, I found water sacks made from the inner peritoneum of an animal, not unlike a pig's bladder; these water sacks are closed with a short stick and leather string.
[312] The ostrich eggs also serve the Bushmen as artificial watering places in the dry stretches of the water-poor steppe regions, in which a number of them are hidden under the sand.

415 "Among the other household utensils of the Bushmen, I also found flat, wooden vessels, wooden mortars, and earthen pots of various sizes. The wooden vessels, which are completely different from those of the Herero, are, according to their own state-
[439] ments, obtained in trade from their northern neighbors. The earthen pots likewise are not made by the Bushmen themselves. In form they are somewhat reminiscent of the wooden Omeira pots of the Herero and, as a Herero half-breed declared and demon-
600 strated to me, are manufactured in the following manner. A lump of soft and thoroughly kneaded clay is spread out over the naked, moistened knee, so that first of all it assumes the form of the knee. The calf of the leg must be pressed to the thigh in order to obtain the correct shape. Then the clay is carefully taken off, and the shape of the vessel is improved and perfected by kneading it with the fingers. Finally simple decorations are scratched into it with a

[79 cont.]

wooden stick. The Herero are not acquainted with the potter's wheel; moreover, these native clay pots have already for the most part been supplanted among them by imported European iron pots."

VORREDE

Nachdem ich im Jahre 1930 im ersten Bande dieses Werkes meine Beobachtungen und Schlußfolgerungen auf dem Gebiete der Vorgeschichte niedergelegt hatte, gebe ich in diesem Bande meine Aufnahmen bei den Eingeborenenstämmen, die ich auf längere Zeit besuchen konnte, wieder. Dieser Band möge als reines Quellenwerk angesehen werden. Ich hatte ursprünglich beabsichtigt, ein abgerundetes Bild aller Eingeborenenkulturen südlich des Kunene und Limpopo zu bieten. Ich mußte mich jedoch, mit Rücksicht auf den mir zur Verfügung stehenden Raum, auf meine eigenen Feststellungen beschränken. Im dritten Bande dieser Veröffentlichung hoffe ich Rassen- und Kulturgeschichte Südafrikas als eine organische Einheit darzustellen.

Ich bin dem Verlage Karl W. Hiersemann in Leipzig zu besonderem Dank verbunden, daß er trotz der schweren Zeitläufte es übernahm, diesen Band herauszubringen. Ich danke weiter der Deutschösterreichischen Wissenschaftshilfe, welche durch ihre wertvolle Unterstützung die Drucklegung förderte. Ich danke weiterhin den Direktionen der Völkerkundemuseen in Berlin, Hamburg, Stuttgart und Zürich für die gütige Überlassung von Bildmaterial.

Die Stämme, deren Kulturen ich schildern konnte, befinden sich alle im Zustande fortschreitender Europäisierung. Für die meisten derselben, nämlich die Stämme Südwestafrikas, erschien europäische Kultur und Zivilisation in deutscher Prägung, und darum darf ich hoffen, daß die Kulturen dieser Stämme, die durch Jahrzehnte unter deutscher Hoheit standen, gerade im deutschen Volke besonderes Interesse finden werden.

EINLEITUNG

Zweck meiner Expedition, auf welcher ich von meiner Gattin, Maria Lebzelter-Grammetbauer, begleitet wurde, war das Studium der Anthropologie und Ethnologie der Eingeborenenstämme, besonders der Buschmänner, sowie der archäologischen Verhältnisse Südafrikas. Der ursprüngliche Plan stammt von Prof. P. Dr. Wilhelm Schmidt, S. V. D. Wiederholte großherzige Spenden Sr. Heiligkeit Papst Pius XI. ermöglichten die Fortführung der von P. Schmidt mit nimmermüdem Eifer geförderten Expedition. Die österreichische Bundesverwaltung ermöglichte es mir durch besondere administrative Maßnahmen, die Reise anzutreten. Auch der Herausgeber des „Anthropos", Prof. P. W. Koppers, hat dem Expeditionsfonds wiederholte namhafte Unterstützungen zukommen lassen. Der Research Grant Board in Johannesburg bewilligte mir – allerdings für rein anthropologische Zwecke – eine einmalige Subvention von 50 Pfund.

Programm und Durchführung meiner südafrikanischen Expedition habe ich bereits im ersten Bande dieses Werkes niedergelegt. Hier, am Eingang in die Darstellung der ethnologischen Ergebnisse, möchte ich in großen Zügen schildern, wie sie zustande gekommen sind. Ich muß vorausschicken, daß zwischen dem Zeitpunkte, wo durch die Maßnahmen der österreichischen Behörden gesichert war, daß ich die Heimat verlassen konnte, und meiner Abreise nur ein Zeitraum von drei Wochen lag. Von einem eingehenderen Studium der Eingeborenensprachen konnte daher keine Rede sein. Die Bedingungen, unter welchen man heute ethnologisch im Felde arbeiten kann, sind grundsätzlich verschieden von jenen der Pionierzeit. Durch die Tätigkeit der Missionen wächst, von den Buschmännern abgesehen, bei allen Stämmen eine Intelligenzschicht heran, die wenn auch nicht in dieser Generation, so doch sicher in der nächsten die Erforschung des eigenen Volkes mit Erfolg in die Hand nehmen wird. Ich erinnere mich eines Advokaturschreibers in Natal (Swazi), der sich ein ethnologisches Vorlesungsheft aus Johannesburg beschafft hatte und dieses auswendig konnte. Als er sich an einen weißen Ethnologen wandte, um mit der praktischen Arbeit zu beginnen, versicherte ihm dieser, so wenig als ein Rennpferd zum Pflügen verwendet werden könnte, so wenig könnte ein Ochse zum Rennsport verwendet werden. Inzwischen sind aber doch bereits einige recht gute Arbeiten von Eingeborenen erschienen. Ich habe mich bei meinen Arbeiten durchweg eingeborener Schulmeister bedient, die nicht nur die deutsche oder englische Sprache in Wort und Schrift, sondern auch ihre Muttersprache in Grammatik und Phonetik beherrschten.

Bei den Zulu und Swazi habe ich mehr gelegentlich Studien gemacht. Hier war es insbesondere Pater Andreas Ngidi in Inkamana, Prinzessin Maria Dhlamini in Mbabane und die italienischen Missionare des Swazilandes, denen ich meine Angaben verdanke. Meine Reise stützte sich vorwiegend auf die Missionen. Während in den Vikariaten der katholischen Missionen von Zululand und Marianhill das Hauptgewicht der Arbeit auf anthropologischem und prähistorischem Gebiete lag, gehörten in Südwestafrika ethnologische Studien zu den speziellen Aufträgen der Expedition. Durch die Liebenswürdigkeit des Herrn Provikars P. Schleipen der katholischen Mission in Windhuk wurde mir der Schulmeister Alois Kheibeb zugeteilt, mit dessen Hilfe ich mit den alten Daman in Kontakt kam. Auf der

katholischen Mission in Okombahe führte mir P. Bachmann den Bruder des Häuptlings Gottlieb Horoseb zu, der mit ein paar anderen alten Leuten kam, um mir Geschichten zu erzählen. In Grootfontein war es P. Jaeger, der mir seinen Damaschulmeister Nikolaus Horoseb zur Verfügung stellte. Es gelang dann weiterhin, eine sehr intelligente !Kungfrau, Katiti, die mit einem Hei//om verheiratet war, zu gewinnen, und auf diese Weise war es möglich, mit den !Kung in sprachlichen Kontakt zu treten. Im Ovamboland konnte ich mich auf die großzügige Hilfe der finnisch-evangelischen Mission stützen. Durch die Vermittlung von Herrn Leuche engagierte ich einen angesehenen Mann aus Oshigambo, namens Erastus Mbumba, der 13 Jahre als Clerk in Swakopmund gewesen war und glänzend deutsch sprach. Die Buschmanngewährsmänner im Ovambolande sprachen Ovambo. In Epukiro stellte mir der Missionsobere P. Watterott, O. M. J., den Dorfschulzen Franz Arenat zur Verfügung, der seinerseits wieder den Kontakt mit den Nogau-Buschmännern herstellte. Die Dolmetscher müssen gut bezahlt werden. Allen, die mir bei meinen Arbeiten behilflich waren, sei an dieser Stelle herzlichst gedankt.

Um einen wirklichen Erfolg auf ethnologischem Gebiete zu erzielen, ist es notwendig, auch das Vertrauen und die Sympathie der Eingeborenen zu gewinnen und in ihnen die Überzeugung zu wecken, daß man nicht irgendwie Böses im Schilde führe oder sie lächerlich machen wolle; Geld allein genügt nicht. Das Verhältnis zwischen den Weißen und Farbigen ist ein solches, daß der Eingeborene von vornherein dem Weißen mit dem größten Mißtrauen gegenübersteht. Die Eingeborenen sind im Grunde genommen höfliche Leute und leben untereinander nach streng geregelten Umgangsformen. Kein Eingeborener wird einem anderen etwas Unangenehmes ohne Grund sagen. Anreden, etwa wie man sie bei uns häufig hört: „Sie sehen schlecht aus, Sie sind wohl krank?" u. ä. Liebenswürdigkeiten, sind ausgeschlossen. Jeder Eingeborene erwartet, daß er seiner sozialen Stellung entsprechend behandelt wird. Die Eingeborenen können es nicht verstehen, wenn etwa ein europäischer Reisender oder Missionar junge Leute außergewöhnlich liebenswürdig behandeln würde, dagegen empfinden sie die wegwerfende Behandlung älterer Leute und Familienväter als eine grobe Taktlosigkeit. So ist z. B. im Ovamboland die Respektanrede für Männer „Tati" = Vater. Der Ethnologe, der die ergrauten Männer eines Eingeborenenstammes so behandelt, als ob sie alte Leute der eigenen Rasse wären, die, mögen sie sich in welcher Stellung immer befinden, ihre Lebensaufgabe erfüllt haben und darum Achtung verdienen, wird gewonnenes Spiel haben. Aber so einfach und selbstverständlich es aussehen würde, nach dieser Maxime zu handeln, so schwierig ist es in vielen Fällen. Ich will ganz davon absehen, daß mancher Gelehrte in den Eingeborenen weniger Mitmenschen als Studienobjekte sieht, die Hauptschwierigkeit liegt in den eingebürgerten Umgangsformen der Weißen den Eingeborenen gegenüber. Kein Eingeborener darf auf einem Sessel in Gesellschaft der Weißen sitzen. In den europäischen Häusern befindet sich meist vor oder hinter der Eingangstür ein Bänkchen für schwarze Honoratioren. Der gewöhnliche Eingeborene hockt auf dem Boden. Man behauptet ja nicht mit Unrecht, daß dies die ursprüngliche Art des Sitzens bei ihnen ist, aber trotzdem empfindet der Schwarze diese Art, wenn sie ihm vom Europäer aufgezwungen wird, als eine Demütigung. Der Eingeborene ist nun eben in der Anschauung der dort lebenden Europäer eine Menschensorte minderer Art, mit der man nicht einmal dieselbe Kirche gleichzeitig besuchen will, was vielen Missionaren den Dienst sehr erschwert. Würde der Reisende mit diesen Sitten oder Gebräuchen radikal brechen, so würde er sich damit des Verkehrs und der Unterstützung der Europäer begeben, auf die er doch angewiesen ist. Es gehört also ein außerordentliches Maß von Takt dazu, um weder das Selbstgefühl der Weißen noch das der Eingeborenen zu verletzen. Bei manchen Stämmen, wie bei den Herero oder bei den Ombarantu, ist die Abneigung gegen die Weißen freilich so groß, daß nutzbringende ethnologische Arbeit derzeit ziemlich unmöglich ist. Aber auch bei den Buschmännern war die Sache keineswegs einfach. Der alte Khame, der später mein guter Freund und Gewährsmann wurde, lehnte zuerst die Mithilfe mit der Begründung ab: „Wie soll ich mein Herz aufmachen, wo ich doch weiß, daß du mein Feind bist." Der Eingeborene hat auch ein sehr gutes Empfinden dafür, ob die Achtung, die man ihm entgegenbringt, aufrichtig ist oder nicht. Er leidet schließlich bei der Behandlung, die ihm zuteil wird, auch an Minderwertigkeitskomplexen, die seine Behand-

3: Lebzelter FX10 Bushmen

lung noch schwieriger gestalten. Ich habe die Eingeborenen so behandelt, als ob sie Europäer wären, natürlich unter Berücksichtigung der eingeborenen Umgangsformen, und bin dabei gut gefahren.

Ein einziger ernstlicher Konflikt mit den Eingeborenen kann das Ende einer Expedition bedeuten. Nicht nur, daß die Kolonialbehörde richtigerweise die Erlaubnis zum Überschreiten der Polizeizone nur an jene Leute gibt, die erwiesenermaßen mit den Eingeborenen das Auskommen finden, ist auch die Nachrichtenübermittlung unter den Eingeborenen eine außerordentlich rasche. Die Kunde von meinen Messungen in Walfischbai kam in 14 Tagen in die Otjihorongo-Reserve und von dort in einer Woche nach Otjituo im äußersten Nordosten, nicht etwa durch Postverbindung, sondern durch herumwandernde Herero. Die Leute kannten in Otjituo bereits bei meiner Ankunft meine Absichten und meine Persönlichkeit. Man wird vielleicht an meinen Ausführungen beanstanden können, daß es nur bei ganz wenigen Stämmen gelang, ein abgerundetes Bild zu liefern. Ich kann wohl sagen, daß die inneren Voraussetzungen für eine völlige Durchdringung des Stoffes überall gegeben waren. Ich habe die Untersuchungen bei den einzelnen Stämmen so lange geführt, als ich Geld zur Verfügung hatte. Man kann sich ja nicht auf einen Gewährsmann stützen, sondern man braucht deren in jedem Falle mehrere. Ethnologische Erhebungen sind so ziemlich die einzige Möglichkeit für den Eingeborenen, wo er Bedingungen stellen kann. Ich kann ihn zwingen, zu dem landesüblichen, niedrigen Lohn Draht zu spannen, Mais zu ernten oder Vieh zu hüten, so wie ich es will. Nicht zwingen aber kann ich ihn, seine alten Stammestraditionen preiszugeben. Nicht einmal die Buschmänner wollten „braunes Geld" nehmen, sondern nur „weißes" und „gelbes". Nachdem ich das Vertrauen der Eingeborenen, wie ich wohl sagen kann, gewonnen habe, ist die Summe der jeweiligen ethnologischen Ergebnisse eine Funktion der mir jeweils zur Verfügung gestandenen Menge „gelben" Geldes.

Die Arbeitsergebnisse bedingen zusammen mit dem zur Verfügung stehenden Raum Umfang und Inhalt dieses Buches. Für die prähistorischen Kulturen sei auf den ersten Band verwiesen.

Meine ursprüngliche Absicht, von jenen Stämmen, bei welchen ich selbst keine Untersuchungen vornehmen konnte, eine übersichtliche Darstellung zu geben, mußte mit Rücksicht auf den zur Verfügung stehenden Raum unterbleiben. Ich gedenke dies in den Schlußabschnitten des III. Bandes zu tun, wo im Anschluß an die Darbietung der anthropologischen Befunde ein Gesamtüberblick über Kultur- und Rassengeschichte Südafrikas gegeben werden soll. Nur bei der Behandlung der Buschmannstämme Südwestafrikas habe ich die Literatur mehr herangezogen. Insbesondere die Offiziere der Kaiserlich Deutschen Schutztruppe haben auf diesem Gebiete wertvollste Pionierarbeit geleistet. Ihre mit militärischer Exaktheit gemachten Angaben sind unübertrefflich und ethnologische Quellen ersten Ranges.

Wo ich nicht selbst beobachtete, sondern die Übersetzungen meiner Eingeborenen-Dolmetscher niederschrieb, habe ich diese unverändert gelassen. Man möge mir also die stilistischen Mängel, die da und dort aufscheinen, nicht anlasten. Die Eingeborenenworte haben meistens meine Dolmetscher niedergeschrieben. Ich hätte mich gefreut, wenn es mir möglich gewesen wäre, alle Texte von berufenen Fachleuten überprüfen zu lassen. Dies war nicht möglich. Ich bitte also um Nachsicht, falls linguistische Schreibfehler unterliefen. Immerhin, diese Leute schrieben ihre Muttersprache.

DIE BUSCHMANNSTÄMME

Nach geologischen Zeiträumen betrachtet ist Südafrika wohl ebenso lange besiedelt wie die übrigen Teile der alten Welt. Wir kennen natürlich erst jene Kulturen, welche über eine Steinindustrie verfügten. Unter diesen ist die auch sonst älteste Faustkeilindustrie auch in Süd- und Südwestafrika weit verbreitet. Nachdem als einer ihrer Träger neuestens durch Reck die Oldowayrasse festgestellt wurde, kann auch für Südafrika das Vorhandensein eines eurafrikanischen Rasseneleme ntes von der ältesten Zeit an für gesichert gelten. Den Trägern dieser Faustkeilindustrie, die nach meiner Überzeugung bereits eine Art Pflanzenbau trieben und im wesentlichen an die Waldzonen gebunden waren, folgte späterhin eine Gruppe von Völkern und Rassen mit ausgesprochenen Abeplißindustrien; dahin dürfen wir die Katangarasse und die anderen australiformen Funde zählen. Einen neuen Schub eurafrikanischer Rasseneleme nte brachten die Träger der Klingenindustrien des mittleren Steinzeitalters Südafrikas. Wann die Buschmannrassen eine Steinzeitindustrie übernommen haben und wann sie überhaupt ins Land gekommen sind, können wir heute noch nicht feststellen. Wie die Buschmänner der Rasse nach Reste aller der vorhergegangenen oder neben ihnen einst existenten Rassen (europäide—australiforme) in sich aufgenommen haben, so ist ihre Kultur auch, variierend von Stamm zu Stamm, nur in ihrer optimalen Anpassung an die Daseinsbedingungen eine Einheit, in ihren Einzelzügen aber eine Restkultur, deren Bestand auf einer Auslese, die gewollt und zweckmäßig durchgeführt wurde, beruht, und die aus den Fremdkulturen von der Altsteinzeit bis in die Gegenwart erfolgte.

EBSTES KAPITEL

DIE BUSCHMÄNNER VON ANGOLA

Die meisten Angaben über die Angola-Buschmänner verdanken wir D. F. Bleek[1]. Die Buschmänner sind !Kung. Die Männer sind 159,3 (145,5—170) cm, die Frauen 148,8 (135—161,3) cm groß. Sie wohnen zwischen dem Mouma im Norden, dem Lomba im Süden und zwischen Okawango und dem Ninde. Sie haben das Sammeln von Feldkost eingestellt und beschränken sich auf die Jagd, für deren Erträgnisse sie Vegetabilien u. a. von den Mabunda und Luchazi, zu denen sie in einem Abhängigkeitsverhältnis stehen, eintauschen. Die Zeiteinteilung ist wie bei den !Kung im Süden.

Die Angola-Buschmänner haben zwei oder drei Weiber. Einige der Ehepaare waren Vettern.

Jeder Haushalt hat einige Kalebassen, ein paar Körbe und einen Tontopf. Holzstampfer zum Zerkleinern des Getreides sind wie im Süden üblich.

Bei den Buschmännern von Kunsumbia wird Durchbohrung der Ohrläppchen und Nasenscheidewand festgestellt. Tatauierung der Stirn mit senkrechten Streifen zwischen den Augen haben alle erwachsenen Männer. Ebenso tragen sie am Arm und auf der Brust sogenannte „Fleischmarken"[2]

[1] D. F. Bleek, Bushmen of Central Angola, Bantu Studies, Bd. III, Nr. 2. 1928. Johannesburg. Ferner Archiv für Anthropologie 1930.

[2] Auch in Ongandjera und an der Natakanakopfanne.

[p. 4 is blank]

zur Erinnerung an getötetes Großwild. Auch die Frauen sind tatauiert. Als Waffen besitzen sie außer Pfeil und Bogen noch den Kirri und ein kurzes Messer. Speere sind selten. Die Eisenwaren sind natürlich im wesentlichen von den Bantu eingehandelt, doch haben die Buschmänner in Musombu auch schon eine eigene Schmiede.

Den Regentanz schildert Bleek ebenso, wie ich ihn gesehen habe. Die Frauen und Mädchen stehen in einer Gruppe auf der einen Seite, singen und klatschen in die Hände, während die Männer auch singen, aber nicht klatschen und rhythmische Bewegungen mit dem Oberkörper und den Armen ausführen. Dazu wird gesungen:

//nwa-se //kabama //gu a i-i	Neumond, komm heraus, gib Wasser für uns
//nwa-se tatana //gu a i-i	Neumond, donnere herunter Wasser für uns
//nwa-se tala u//gu a i-i	Neumond, werfe herunter Wasser für uns.

Zur Jünglingsweihe ziehen sich die Kandidaten mit drei Medizinmännern auf einen Monat in den Wald zurück. Dort wird bei Nacht getanzt, und gelegentlich erscheint der Geist Huwe beim Tanze. Auch eine Mädchenweihe findet statt, und dabei soll ein anderer Geist //gaua den Tanz leiten. Auch die Tatauierung der Mädchen wird ihm zu Ehren vorgenommen.

Der Mond spielt in ihren religiösen Vorstellungen die Hauptrolle. Der Neumond soll ein Kind oder ein Mann sein, der Vollmond eine Frau. Sie sagen auch, daß der Mond die ältere Schwester, die Sonne die jüngere Schwester sei. Neben dem Monde erscheinen Huwe und //Gaua als mythische Personen. Statt Huwe sagen sie auch //Nwa-se, „kleiner Neumond". Bleek meint, daß Huwe der Geist des Waldes ist, der das Wachsen der Bäume und des Grases und damit auch das Gedeihen des Wildes verursacht und so auch Erfolg und Mißerfolg der Jagd bedingt. Eine Verehrung Huwes konnte nicht festgestellt werden. Interessant ist, was über //Gaua ausgesagt wird: „//Gaua ist ein anderes Wesen. Die Leute vom Ngami-See geben dem Wort drei Bedeutungen: Traum, Gespenst, Geist. Bei den Angola-Buschleuten wird es manchmal für Gespenst, manchmal mehr unpersönlich gebraucht. Eine Frau sagte: Wenn ein Mensch stirbt, dann kommt aus seinem Grab ein Gespenst (//Gaua) heraus, welches von den Medizinmännern gesehen werden kann." Donner und Blitz kommen von //Gaua. Wer vom Blitze erschlagen wird, der wird zu einem Stern am Himmel. Die Sterne sind die Lagerfeuer des //Gaua. Die Buschmänner sollen die Kinder des //Gaua sein. Er ist ein Mann, der im Walde lebt, und sein Haus ist eine Höhle in der Erde. Ein Informant erklärte, daß //Gaua soviel wie Ndjambi (Gott) sei. Es gibt zwei Arten von Medizinmännern, solche, die die Geister sehen können und die Jünglingsweihen durchführen und tatauieren, während die zweite Sorte die Krankenheilung betreibt.

ZWEITES KAPITEL

DIE BUSCHMÄNNER DES WESTLICHEN OTJIMPOLOFELDES

In Shandi, im östlichen Ukuanjama, konnte ich durch die Liebenswürdigkeit des Residenten Mr. Eaddes und des Eingeborenenpastors Paulus Kontakt mit Buschmännern bekommen. Es waren teils wirkliche !Kung, die sagten, sie seien dieselben wie jene von Karakowiss, mit denen jedoch eine brauchbare Verständigung nicht möglich war, teils waren es solche, die sich wohl als !Kung bezeichneten, nach Sprache und Sitte aber den südlichen Buschmännern des Ambolandes zuzuzählen sind. Sie selbst sagen, ihre Väter seien aus Ongandjera gekommen. Nur auf letztere beziehen sich die folgenden Angaben.

Den Himmel bezeichnen sie als !nanu áiba Êroba Kharésa („Regenhaus Gottes").

Für Gott haben sie die Ausdrücke „Erob" und „χ'amab". In Gebeten wird nur „Erob" gebraucht. χ'amab[1] hat sich erhalten in χ'amá //gu Khe = „Leute, die bei Gott sind", also die Seelen der Verstorbenen im Himmel. Dorthin kommen alle, die Guten wie die Bösen. Erob hat keine Frau und keine Kinder. Der Mensch hat nur eine Seele (!gau-ba). Die geht ins Himmelhaus und bleibt dort, „bis Erob neue Menschen daraus macht". Hier liegt ein allerdings kaum weiter durchdachter Glaube an Seelenwanderung vor.

Auf der Erde bleiben keine Totengeister zurück. Es gibt wohl Buschgeisterchen, die Gangorob, sie sind harmlos und tun nichts. Böse Geisterchen gibt es nicht. Von Heiseb und /Nawa wissen sie angeblich nichts.

Reich ist der Wildbestand in den hochstämmigen Trockenwäldern des Otjimpolofeldes. Auch Fische gibt es in der Regenzeit. Die Buschmänner nennen sie „shiba" (Ovambo: oshi oder ochi), haben also ursprünglich kein Wort dafür gehabt.

Dem Löwen (χ'oréba) stehen sie hilflos gegenüber. Man verläßt eine Gegend, sobald sie von Löwen unsicher gemacht wird. „Es hat keinen Zweck, sie zu jagen."

Der Leopard (χ'nába) wird mit Hunden (ariba) gejagt. Für das Fell zahlen die Häuptlinge des Ambolandes gute Preise; denn kleine Prinzen und Prinzessinnen werden nicht in einem Tragfell aus Kuhhaut getragen, sondern in einem Leopardenfell. Eifrig wird der Schakal (†Khai-eba) und der Löffelhund (//arúba) gejagt. „Aruba" entspricht wohl N. //arob = Streifenschakal.

Wilden Hunden „Kheré" !nube (N. !goub) weicht man am besten aus. Die Hyäne †Khai-laea (N. †heirab) wird nicht beachtet und nicht gegessen. Wenn sie in die Nähe der Werft kommt, ist das kein gutes Zeichen.

Um so eifriger folgt man dem Honigdachs luisa (N. !ous), der zu den Bienen führt.

Gejagt wird das häufige Wildschwein (gariba), das Kudu (daub), der Gemsbock χ'uaba (N. /gaib) und all die kleinen Antilopen. Fallgruben kennen sie nicht mehr. Früher hat es welche gegeben.

Wird eine Jagd beschlossen, so muß man schon die Nacht vorher Geschlechtsverkehr meiden; am Abend begeben sich die Jäger in den Wald und übernachten dort. Vor Morgengrauen erheben sie sich und bitten:

Pu, pu, Eró, /nari dau /ari mate	Gott, morgen früh wir bekommen.

Ist ein Stück Wild zur Strecke gebracht, dann schneidet einer der Jäger ein Stück Fleisch aus dem Körper des Tieres und übergibt es dem Anführer der Jagd. Dieses Fleisch heißt am-shái-khe. Es wird Feuer gemacht und dieses Stück daraufgelegt. Ist es gebraten, dann schneidet der Anführer ein Stück ab und ruft:

Ero, Ero, Ero, ha góre, ha góre	Erob Erob, Erob, essen, essen
i Khe Khandi ô	mit uns Fleisch.

Nach einer Pause:

ha lê a lê ha góre o Khandi ô	Kommt! Kommt! essen wir Fleisch.

Nun wird das gebratene Fleisch verzehrt. Weggeworfen oder zurückgelassen wird für Erob nichts. Sodann wird das Wild zerlegt, und jeder geht mit seinem Teil nach Hause.

Schlangen sind nicht selten, wenn auch lange nicht so häufig, wie in den steinigen Gebieten Südwests.

Die Riesenschlange frißt Menschen; wenn sie einen Buschmann erwischt, fängt sie bei den Beinen an, ihn aufzufressen!

Trotz des Hochwaldes ist die Durstgefahr groß. Erob schickt den Regen. Wenn Durstnot ist, wird getanzt und gebetet:

Êro, Êro, Êro, /ga !goro	Erob, Erob, Erob, wir verdursten
/ga-wi -ma ta re	Wasser gib uns.

[1] χ' bedeutet einen ganz tief angesetzten gutturalen Klix, für welchen ich kein Sigel kenne.

Es ist sehr interessant, festzustellen, wie in diesen sicher uralten Jagd- und Regengebeten die früheren altheidnischen Gottesnamen Huwe und χ'amab durch das christliche „Elloh" ersetzt wurde.

Ich fragte die Leute, ob sie noch andere Gebete wüßten, und erhielt die folgende Antwort: „Wir wissen genau, daß man nichts machen kann ohne Erob, wir bitten ihn auch, wenn jemand krank ist, aber wir haben keinen Gesang dafür, wir tun das im Herzen." In diesen Anschauungen ist wohl der christliche Einfluß eindeutig.

Eine Jünglingsweihe haben sie nicht, wohl aber eine Mädchenweihe zur Zeit der ersten Menstruation.

Die Mädchenweihe heißt „derob".

Das Mädchen wird bei Eintritt der Menses ein „χ'âba χ'âbesa", man baut ihm eine eigene Hütte (omba), wo es von älteren Frauen bewacht wird, die es füttern; es darf alles essen, aber nichts mit der Hand. Gehen die Menses zu Ende, so beginnt ein zweitägiges Fest, das mit einem Schlußtanz endet. Die Kandidatin sitzt in der Mitte. Männer und Frauen gehen im Kreis um sie. Die Männer blasen auf Holztrompeten. (Diese Trompeten werden nur an einer Stelle von den !Kung gemacht.) Dazu wird die Trommel geschlagen (!guruba). Am Schlusse machen die Frauen „Musik". Sie klatschen in die Hände und singen:

e-e-e-e-a-eje a jeja ni u u e...

Darzwischen tönen die Trommeln und Holztrompeten. Dann beginnt der Chorgesang der Männer.

boro ai /i-he ǂhasa	Tochter meine geworden groß (gerade)
ǂhau ge	Steh aufrecht (groß)
/gai /ka uta (?) /noro-re	Gut sei jetzt unser Sonnenscheinchen[1]
/ari ni tessa	Tanzt[2], singt, werbet um ihre Hand[3]
!goasa hi bare	Leute, freut euch
Ti Komi !gôâ Kôô ... Kôô ... Kôôô ..	So, auf diese Art, Leute, sollt ihr es machen.

Sodann beginnt der Tanz von neuem.

Die Verlobung erfolgt meist schon lange vor der Mädchenweihe. Die Regel ist daher, daß Hochzeit und Mädchenweihe zusammenfallen und das Mädchen sogleich nach Beendigung der Festlichkeiten auf die Werft ihres ursprünglichen Gatten zieht.

Geht ein Mann auf Freiersfüßen, so muß er zuerst das Jawort des Mädchens zu erhalten trachten. Ist das gelungen, so geht er zu den Eltern des Mädchens. Stimmen auch diese zu, so ist die Verlobung perfekt. Nun wird jeder Verkehr unterbrochen, bis der Bräutigam erscheint und zu den Eltern des Mädchens sagt: „Ich will jetzt Hochzeit machen." Sind die Eltern auch jetzt noch einverstanden, dann gehen sie zu ihren Verwandten, um ihnen die freudige Mitteilung zu machen. Diese können durch ihren Einspruch die Ehe noch verhindern. Tun sie es nicht, so wird das Hochzeitsfest angesetzt. Im Busch muß der Bräutigam den Brauteltern ein Stück Großwild bringen. Meistens machen sich die Leute die Sache leichter. Entweder sie haben sich bei einem schwarzen Bauern bereits ein Rind verdient, das nun in dessen Herde steht und für den Hochzeitsschmaus abgeholt wird, oder – und das ist das Häufigere – das Buschmännchen beginnt eine Bettelfahrt durch die schwarzen Höfe, bis ihm jemand als Vorschuß auf später zu liefernde Felle oder zu leistende Arbeiten eine Kuh gibt.

Und wunderbarerweise gelingt dies immer. Das erklärt sich aus verschiedenen Gründen. Nie würde ein schwarzer Bauer, zu dessen übelsten Charakterzügen Geiz und Habsucht gehören, einem anderen Schwarzen, der nichts hat, eines von seinen heißgeliebten Rindern auf unsichere Versprechungen hin geben. Und nicht mit Unrecht. Die Kuh wäre am nächsten Tag im Magen des Bittstellers und seiner Freunde verschwunden und der Bittsteller am übernächsten Tag jenseits der Stammesgrenze. Wiederholt kamen die Buschmänner zu spät zu meinem Lager. Aber immer erhielt ich von den Ukuanjama die Beruhigung: „Die Buschmänner halten Wort, sie kommen bestimmt, wenn sie leben." Dazu kommt natürlich die Symbiose. Jedes Dorf hat seine Buschmänner. Für die Zeit der Ernte tauchen

[1] Wörtlich: „Lichte, du". [2] Wörtlich: „Springst". [3] Wörtlich: „Fragst an!"

sie auf und helfen mit. Zwischendurch lassen sie kein Fest aus, und einmal kommt dieser mit Fellen, jener mit Honig. Und schließlich sehen die Sippenhäuptlinge der Buschmänner darauf, das nichts geschieht, was dem Ansehen der Buschmänner abträglich sein könnte. Daß diese Leute Diebereien begehen, ist unerhört.

Die Ehe ist bis zur Geburt des ersten Kindes trennbar, nachher nicht mehr. Monogamie ist die Regel; wo Polygamie herrscht, ist die erste Frau die „Hauptfrau". Der älteste Bruder der Hauptfrau ist das Familienoberhaupt. Die Knaben gehören zur Familie der Frau, die Töchter zur Familie des Vaters.

Es herrscht strengste Exogamie. Sohn und Tochter dürfen weder in die Sippe des Vaters, noch in die Sippe der Mutter heiraten. Dagegen wird eine junge Witwe meist von einem ihrer Schwäger geheiratet.

Folgende Sippennamen wurden mir mitgeteilt:

!Nui-a, Dai, χaben, χorasi, Gombe, χ'am, χ'am-Kha.

Folgende Tageszeiten werden unterschieden:

eruba ..... Zeit vor Sonnenaufgang.

!khoasa ..... Zeit des Sonnenaufganges (N. Khoa-am = öffnen, d. h. die Tür für die Sonne wird aufgemacht).

sorésa ..... „Sonne scheint".

sorésa ǂkam go „Junge Sonne geht", Frühstückszeit. Man hat in der Tat unter den Wendekreisen den Eindruck, als würde die Sonne, nachdem sie eine Zeit am Horizont gestanden, mit großer Geschwindigkeit dem Zenit zustreben.

sorésa !khoai go . „Sonne zurück geht". Mittagszeit.

//gui-sa ..... „Sie neigt sich (legt sich)". Nachmittag.

ǂkhai-am-go .... „Aufstehen und gehen".
Nach Jagd oder Feldkostsuche pflegt man Rast zu halten, ehe es Zeit wird nach Hause zu gehen und die Küche in Betrieb zu setzen (Spätnachmittag).

ǂkha-go ..... „Durchgehen". (Die Sonne geht durch das Tor der Nacht.) Dämmerung, Sonnenuntergang.

!khui-sa ..... Abend sein.

dachu-ba ..... Nacht (N. tsuχub).

Diese Buschleute haben die Vorstellung, daß die alte Sonne jede Nacht stirbt und eine neue junge Sonne am nächsten Morgen erscheint. Daß der Mond allmonatlich stirbt und wieder aufsteht, ist eine in Afrika so verbreitete Anschauung, daß es eigentlich unnötig wäre, dies besonders zu erwähnen.

Das Jahr beginnt mit dem Einsetzen einer neuen Regenzeit.

//hauba ..... „Gewitter steigen". = Regenzeit.
shauba ..... Kalte Zeit (N. sáob).
!kn-aba .... Heiße Zeit (N. !nái, warm).

An Tänzen wurde mir ein Straußen- und ein Affentanz genannt.

Die so aussichtsreich begonnenen Studien fanden dadurch ein Ende, daß ich dem Dorfhäuptling offenbar zu wenig schenken konnte. Eines Abends erschien ein Junge und teilte mir mit, die Buschmänner hätten „zur Jagd gehen müssen". Ich wartete dann noch einige Tage auf die von Mr. Eaddes gerufenen !Kung. Die Boten kehrten mit der Meldung zurück, sie hätten niemand gefunden. Noch ein Bratenrock für den Dorfschulzen und etwas gelbes Geld für die Buschmännchen, und unschätzbares Material wäre zu gewinnen gewesen.

3: Lebzelter FX10 Bushmen

DRITTES KAPITEL

DIE DAMAN-BUSCHLEUTE AUS DEM PALMBUSCH ÖSTLICH VON ONDONGA

Ihrer Tradition nach kommen diese Buschleute aus dem Hererolande. Sie stellen daher das Bindeglied zwischen den „Saan" im Gobabisdistrikt und Hei//om des Nordens dar. Das Volk als Ganzes bezeichnet sich als Daman — die Reichen. Die Horde um Oshigambo nennt sich //Haru-Khâi. Ihr Idiom nennen sie Châraba. Ich glaube nicht, daß sie weit ins Otjimpolofeld hinein wohnen. Vor den !Kung haben sie gewaltigen Respekt. Die äußersten Viehposten von Ondonga werden so ziemlich mit den Grenzen ihres Bereiches zusammenfallen. Einige von ihnen sind bantualisiert und haben kleine Anwesen. Die anderen obliegen der Jagd und liefern den schwarzen Bauern Wildfleisch, Felle, Straußeneiperlen und Gift. Sie stellen die Treiber bei den großen Jagden Chief Martins. Am Hofe gelten sie nichts. Die Bauern sehen sie nicht ungern. Kleine Hilfeleistungen, ein Sack Beeren oder Feldkost erweichen das Herz der schwarzen Hausfrau, so daß es hier wie in Uukualuthi auch einige Bummler gibt, die aber gern gesehen sind.

Da ich mich mit ihrem „Vormann", der einen kleinen Bauernhof besitzt, recht anfreunden konnte, habe ich Eingehenderes auch über ihre Weltanschauung erfahren.

Sie glauben an ein höchstes Wesen, das nicht als Mensch aufgefaßt wird und das sie χ'amaba nennen. Hier haben wir den /Gamab der Bergdama H. Vedders vor uns.

χ'amaba hat alles gemacht, die Sonne, den Mond, die Sterne und auch die Menschen. Zuerst hat er die Weißen gemacht, dann die Schwarzen, zum Schluß die Buschmänner. Wie χ'amaba die Menschen gemacht hat, wissen sie nicht zu sagen.

Die alten Buschleute sagen, das Feuer käme vom Teufel. Heiseb wird bei ihnen zum Teufel. Heiseb und der Strauß haben zusammen gespielt. Der Strauß hatte das Feuer auf seinem Arm. Der Strauß zog beim Tanzen die Flügel auseinander, und Heiseb nahm das Feuer heraus. Heiseb warf den Feuerbrand hinter sich. Dort war ein Busch, der zu brennen anfing. Und dort fanden auch die Menschen das Feuer.

Heiseb ist böse und tut nur Böses. Er wird in Menschengestalt gedacht. Wo er herkommt, weiß man nicht.

χ'amaba dagegen ist gütig. Man betet zu ihm um Hilfe.

Ich habe folgende Gebete aufgezeichnet:

1. Bittgebet um Regen: In alter Zeit schnitt man Stücke von Holz aus dem !Hawewa-Baum. Er durfte nicht gefällt werden. Diese Holzstücke warf man ins Feuer, und sobald der starkriechende Rauch zum Himmel aufstieg, sang man im Chor:

χ'amaba duwa /gam-i-i aa	Gott gib Wasser trinken.
χ'amaba duwa /gam-i-i !hanusa	Gott gib Wasser Regen,
anita(?) aa	damit wir trinken.

2. Dankgebet für Regen: Ist der Regen endlich gekommen, dann wird ein Freudentanz veranstaltet und gesungen:

χ'ámaba χ'ámaba χ'ámaba	Gott Gott Gott
tûta tûta	Wir haben bekommen, Wir haben bekommen
!hanusa /gam-i-i !hanusa /gam-i-i	Regen Wasser, Regen Wasser
tara ái /gam ái !hanusa tutasi	Wir können trinken, Wasser trinken, Regen bekommen.
χ'ámaba χ'ámaba χ'ámaba χ'ámaba	Gott Gott Gott Gott
/gami tara ái	Wasser wir können trinken!

In den wasserlosen Wildnissen des Palmbusches und des Otjimpolofeldes tritt der Dursttod auch an den entbehrungsgewohnten Buschmann oft genug heran. Sie leugnen nicht, daß es vorkommt, daß Alte und Kranke in der Wildnis zurückgelassen werden müssen. Aber ein solches Ereignis lebt als schweres Unglück im Gedächtnis der Leute lange fort. Wer die Kindesliebe und die Verehrung der Eltern und Alten bei den Buschmännern kennt, kann verstehen, was es für sie bedeutet, einen der ihrigen zurücklassen zu müssen. Man muß das Gefühl selbst gehabt haben, welches sich einstellt, wenn in Durst und Hitze der Körper keinen Schweiß mehr abgibt, die trockene Stirne sich brennend heiß anfühlt und leises Frösteln durch den Körper zieht, um diesen so naiv anmutenden Freudengesang zu verstehen, dessen Inhalt ist: Wir können wieder trinken!

3. Stoßgebet beim Antritt einer Reise:

χ'ámaba !Khu gai teve Gott reisen laß mich gut.

4. Chorgebet für einen Kranken: Wenn jemand schwer erkrankt ist, singen die Verwandten im Chor, während der Doktor seine Zeremonien macht.

χ'ámaba !khoé-wa /khai kháira tévo Gott Leute unsere aufstehen lasse.

5. Kein eigentliches Gebet, aber eine Beschwörungsformel spricht man für sich, wenn man einem Fremden begegnet, den man für böse hält:

Tshai Kwewa /Nawa!

Von der Sonne (sorden) wissen sie nichts zu sagen. Der Mond (χ'áwa) stirbt allmonatlich und wacht wieder auf.

Die Krankheiten schickt χ'amaba. Er schickt sie jenen Leuten, auf die er böse ist. Andere Geister spielen dabei keine Rolle. Auch Krankheitsgeister gibt es nicht.

Im Busch gibt es eine Menge Geisterchen, die /ga /ga hû. Sie machen Schabernack.

Der Mensch hat bloß eine Seele !gauba. Diese geht nach dem Tode in den Himmel. (!nanu-alba, Regenhaus?) Dort ist das Haus des χ'ámaba (/khauba). Wie es da oben aussieht, wissen nur die Doktoren. Die sprechen mit χ'ámaba.

„Totengeister bleiben keine auf der Welt, ich habe überhaupt noch keine Geister gesehen, und ich sage dir überhaupt nur das, was ich weiß. Die Leute reden noch vieles, aber sie wissen nichts." So schloß mein Gewährsmann seine Ausführungen über das Jenseits.

Ein heiliges Feuer kennen die Damanbuschleute nicht.

Eine Jünglingsweihe machen noch die !Kung im Osten. Sie wird bei den Daman nicht mehr abgehalten. Dagegen werden Mädchenweihen abgehalten, über deren Details mir die Auskunft verweigert wurde.

Die Eheschließung ist von der freien Zustimmung des Mädchens abhängig. Allerdings, auf Zureden der Eltern sagen die Mädchen immer ja. Hat dieses die Initiationszeremonien hinter sich, so naht sich bald ein Freier, um ihr zu sagen, „sie sei nun groß geworden und könnte eine Frau werden". Stimmt das Mädchen zu (nach Rücksprache mit ihren Eltern), so geht der Brautwerber zu seinen Eltern. Die künftigen Schwiegereltern fragt er nicht. Der Bräutigam muß zur Hochzeit einen fetten Ochsen bringen und einige Ziegen. Auch die Eltern der Braut schlachten. Die eigentliche Zeremonie besteht darin, daß der Bräutigam die Braut am ganzen Körper dick mit Fett, das mit rotem Ocker gemischt ist, einreibt, während die Männer dazu singen:

jejeje jejeje !hawawa !hawawa.

!hawawa bedeutet Hochzeit. Die Frauen und Mädchen klatschen dabei in die Hände.

Im Eherecht zeigt sich schon stark der bantuische Einfluß. So kann man auch kleine Mädchen schon „heiraten", die der Mann dann bei sich aufwachsen läßt, bis sie geschlechtsreif werden. Ein Mann kann so viele Frauen haben, als er will. Die erste Frau wird nicht gefragt, wenn sich der Gemahl weitere Gattinnen nehmen will. Meine diesbezügliche Frage wurde von der gelbbraunen Runde mit schallendem Gelächter quittiert.

Es ist möglich, eine Frau wegzuschicken, aber es gilt als ungehörig und unschicklich und wird von den Verwandten der Frau als Beleidigung empfunden.

Die Frau kann man sich suchen, wo man will, nur die Heirat mit Kindern der Geschwister des Vaters, insbesondere seiner Schwestern, ist verboten.

Die Tochter gehört zur Familie des Mannes, der Sohn zur Familie der Frau.

Die schwangere Frau darf keine „Ongaka" essen, ferner keine Buschböckchen (okapundja, //aribkha); Hasen darf sie essen.

Die Geburt erfolgt in der Hütte. Männer dürfen nicht anwesend sein. Sobald die Nabelschnur (//náčha) abgefallen ist, werden dem Kindchen die Haare abgeschnitten und vergraben. Dann wird das Kind aus der Hütte herausgetragen. Der Vater empfängt es und gibt ihm einen Namen, der ganz willkürlich gewählt wird.

Sobald der Tod eingetreten ist, wird der Leichnam entkleidet, in Felle oder Decken eingehüllt und in Streckstellung mit dem Kopf nach Westen auf die linke Seite ins Grab gelegt. Auf das geschlossene Grab wird Buschwerk gelegt. Die Leute kommen hin, um dort zu weinen. Opfer werden nicht gebracht.

Bei Antritt der Jagd werden gewisse Zeremonien ausgeführt, von denen ich glaube, daß sie zum Teil von den Owambo übernommen wurden.

Die Jäger treffen sich an einem bestimmten Platz im Walde (Khoá !Khuásha). Jeder Jäger bringt einen Zweig mit Omsatiblättern; diese werden auf eine Stelle zusammengeworfen (omsati-//khái-wa). Rundum wird ein Kreis in den Sand gezogen. Jeder Jäger tritt in den Kreis und auf die Blätter und sagt:

//am ǂhaiba, //am ǂhaiba (?)

Der Anführer antwortet:

!Khu !Khu /ao /ao /auschá Herr! Herr! Wir müssen jetzt zur Jagd!

Ist ein Stück Wild zur Strecke gebracht, dann schneidet der glückliche Schütze zunächst ein Stück Fleisch heraus, brät und ißt es, sodann verteilt er das Fleisch an die Mitjäger. Opfer werden keine gebracht.

Dieser Vorgang ist von höchstem Interesse. In der niederen Jagd der Urvölker ist der Einzeljäger unbestrittener Eigentümer des erlegten Wildes. Bei der höher organisierten Jagd, welche diese Buschmänner heute betreiben, wird durch diese Zeremonien das Eigentumsrecht des Einzelschützen nochmals unterstrichen, obwohl in der Folge der Schütze nicht mehr Fleisch bekommt als seine Gefährten.

Das Feldkostsammeln hat hier nicht jene hohe Bedeutung wie im Osten. Vielfach bestellen ja die Buschfrauen bereits ein kleines Hackfeld und hüten die Jungen einige Ziegen, während die Männer noch die Jagd im Hauptberuf ausüben. Aber auch bei den nomadisierenden Gruppen wird die Möglichkeit, gegen Fleisch, Felle usw. Hirse einzutauschen, reichlich benutzt.

Dazu kommt, daß die Schwarzen gerne auf ihrem Tisch Feldkost sehen, weshalb die Buschmänner, ähnlich wie unsere Schwämme- und Beerensammler, ihre Kenntnisse dazu benutzen und einen kleinen Handel mit ihrer Feldkost, aber auch mit Honig treiben.

Dies bedingt, daß Feldkost, die entweder in zu geringen Mengen vorkommt oder nicht schmackhaft ist, überhaupt nicht mehr gesammelt wird, ja sogar die Kenntnis von ihrem Vorhandensein dahinschwindet. Vergessen dürfen wir auch nicht, daß die schwarzen Hirtenjungen längst den Buschleuten ihre Kenntnisse abgeguckt haben. Dadurch ist die Zahl der Interessenten natürlich stark gestiegen, und die Feldkostpflanzen sind selten geworden. Folgende Sorten werden noch regelmäßig gesammelt:

/airoba (ombimbo) ..... Süßliche, stark mehlige Knollen von der Art großer Kartoffeln.
/érui (omauungá) ..... Gallen auf Blättern des Omsatibaumes.
ǂgan-i (esarata) ..... Kleine Früchte.
!Khuí-i (oombi)..... Datteln.
!Korob-ke (oompali) ..... Knollen an den Wurzeln einer Liane.

Aus Kudufleisch wird auch Trockenfleisch gemacht, teils aufbewahrt, teils verkauft.

Aus dem Saft eines Baumes (Euphorbiaceae) !Khores-Ke wird Pfeilgift gemacht. Die Ondonga machen selbst kein Pfeilgift, sondern kaufen es, die Portion zu 1–2 sh, von den Buschleuten. Gegen Pfeilgift hat man keine Medizin. An der Einschußstelle werden tiefe Einschnitte gemacht, man läßt die Wunde erst stark ausbluten und saugt sie dann aus. Bei Schlangenbiß wird ebenso verfahren und etwas Pfeilgift auf die Wunde gegeben(!!!).

Unsere Buschleute leugneten, Gifte zu kennen, die man den Speisen beimengt. Das hätten bloß die „bösen Buschmänner" im Osten. Glauben verdient diese Mitteilung kaum.

In Kleidung, Wohnung und Bewaffnung, ebenso im Schmuck ist nicht mehr viel Ursprüngliches vorhanden. Auf dem Gebiete der materiellen Kultur ist der Prozeß der Bantuisierung viel weiter vorgeschritten als auf dem der Geisteskultur. Man trennt sich eben leichter von Kleidern als von Ideen.

VIERTES KAPITEL

DIE BUSCHMÄNNER VON UKUAMBI

In einer Außenstation der finnischen Mission Ukuambi, wo ich anthropologische Messungen vornahm, traf ich einen Buschmann aus jenen Horden, die am Nordufer der Etoshapfanne wohnen und in einem lockeren Abhängigkeitsverhältnis teils zu Ipumbo, teils zu Shanika standen. Ich konnte mich nur wenige Stunden mit ihm unterhalten.

Diese Buschmänner gehören in Ukuambi ebenso wie an anderen Orten zum Eximo der Akuanambua. Sie selbst zerfallen in eine Anzahl von exogamen Sippen. Mein Gewährsmann gehörte zum Clan Ari-Ari. Der Stamm nennt sich Akese oder Kere und kommt aus der Gegend zwischen Okaukuejo und Outjo. Heute ist die Stammesorganisation zerbrochen. Folgende Namen – früher selbständige Horden –, die jetzt untereinander vermengt wohnen, wurden mir genannt: /Aru-Kwe, Ashuche, Aséha, !Kuru-Kwei, A !Kha-ta-bé, A-Hei-tére, A !gnuri.

Soweit diese Buschmänner nicht schon das Leben der Bantubauern führen, sind sie Jäger, Spione und gelegentlich auch Henker der Häuptlinge. Sie verfertigen Straußeneiperlen und Gift. Für 12 gute Straußeneier erhalten sie einen fetten Ochsen. Die Owambo sind da ganz eigener Meinung. Die guten Eier ihrer Hühner verschmähen sie. Die gewöhnlich etwas „anrüchigen" Straußeneier werden um teures Geld als Delikatesse gekauft.

Die Söhne gehören in die Familie des Vaters, die Töchter in die der Mutter. Den Männern ist verboten, Hasen zu essen, den Frauen und Kindern ist es gestattet. Der Genuß von Hyänen und Riesenschlangen ist allen verboten.

Über ihre religiösen Vorstellungen konnte ich in Erfahrung bringen: Am Himmel wohnt der große Kapitän !Khuwa, was dasselbe bedeutet wie Huwe. Die Frage nach Gott beantwortete er aber damit, daß er sagte, das sei Erob, was natürlich mit dem Gottesnamen Elloh der Rheinischen Mission zusammenfällt. Der Name !Khuwa fiel erst gelegentlich im Gespräch. Meine Frage, ob !Khuwa und Erob nun dasselbe bedeute, konnte er nicht eindeutig beantworten. Diese Leute haben den Ausdruck Ellob jedenfalls aus Outjo, wo es auch einige christliche Buschmänner gibt.

!Khuwa wohnt im Himmelshaus χ'ain !nao gároba. Die Leute im Himmel essen nur große Fliegen !Khu !Khua-i. Die Gestalt /Nawas ist unbekannt. Es fehlt auch der böse Gegenspieler Huwes, //Gauab. Doch haben diese Buschmänner die gleiche Zweiseelenlehre wie die !Kung des Ostens.

Wenn jemand stirbt, wird er Eigentum !Khuwas, er ist ein !Khunga. Die eigentliche Seele χ'áobe geht ins Himmelshaus, bleibt dort und tut nichts, als große Fliegen essen. Aus den Leibern der Toten

entstehen die //gauá-i, die im Busch herumlaufen und Unfug machen. Sie entsprechen den Akwapungu und Azizi der Ovambo. „Aber die eigentlichen Seelen der Ovambo und der Buschleute gehen verschiedene Wege; die der Ovambo gehen unter die Erde, wo sie ihre Felder und Herden haben, die der Buschmänner aber hinauf." Da Herr Missionar Kylves den Wunsch äußerte, selbst eingehende Studien über diese Buschmänner zu machen, habe ich gerne dieses lockende Arbeitsfeld meinem liebenswürdigen Gastgeber überlassen.

Nun noch einige Wortproben, die zeigen, daß diese Leute der Hei//om-Namangruppe zuzuzählen sind, was mit Rücksicht auf die !Kungelemente in ihrer Weltanschauung sehr auffällig ist.

FÜNFTES KAPITEL

DIE BUSCHMÄNNER VON UUKUALUTHI

In ganz Uukualuthi, Uonkolonkathi und Ombarantu gibt es angeblich nur noch 2 Buschmänner, die die alte Sprache verstehen. Beide sind nichtsnutzige Bummler, die von einem Biertopf zum anderen ziehen. Einen davon machte mir dank der Fürsprache der Frau Missionar Aarni der Häuptling Moala stellig. Freilich hielt er es nicht lange aus und war auch in den paar Tagen, wo er die Gnade hatte, sich uns zu widmen, selten nüchtern. Wir mußten unsere Unterhaltungen auf den Vormittag beschränken. Was ich von ihm erfuhr, ist sterbendes Volkstum, nichts Zusammenhängendes mehr. Der Mann stand den Dingen mit der fröhlichen Resignation des chronischen gutartigen Potators gegenüber . . .

Im Himmel gibt es einen Gott (Erob). Blitz (dábara) und Regen (!nanus) werden von ihm gesendet. Den Himmel nennt er χ'ameiba. Dieses Wort ist sehr interessant. Es kann sowohl „Platz der

Seelen (χ'a)" oder auch „Platz des χ'amab" heißen. Die Seelen (um-ské) kommen nach dem Tode in den Himmel. „Man sagt so", meinte der Mann, „ich war noch nicht dort."

Gauab und Heiseb kennt er nicht. Bezüglich sonstiger Geister meinte er, die Leute hätten davon erzählt, er glaube nicht daran. Die Geister sollen „gangarob" heißen. Die alten Buschmänner hätten weder Doktoren noch Mittel gegen Krankheiten gehabt. Auf meine Frage, wodurch denn die Menschen krank würden, antwortete er mit philosophischem Gleichmut: „Wenn man krank wird, wird man krank wie ein Tier." Von Sonne (soris) und Mond (χ'ab) weiß er nichts zu sagen. Ein heiliges Feuer ist ihm unbekannt.

Von höchstem Interesse ist sein zweifelsohne auf Autopsie beruhender Bericht über ein Primitialopfer bei der Jagd. Ich gebe den Bericht in wörtlicher Übersetzung:

„Ehe man zur Jagd aussieht, trifft man sich bei einem Omsati-Baum (//Khaia-eib). Dort macht man ein Feuer. Jeder Jäger rüttet einige Blätter ab, spukt darauf und wirft sie ins Feuer, dabei rufend:

Êroh, Êroh âu tere! Gott, Gott hilf uns!

Ist das Wild gefallen, so schneidet man erst je ein Stückchen von Lunge, Leber und Magen heraus und wirft jedes Stück einzeln zur Seite und spricht dabei:

Êroh ire, Êroh ûre! Gott nimm, Gott nimm!

Dann fängt man zu essen an."

Diese vorgenannte Funktion übt derjenige aus, welcher das Wild getroffen hat.

Bezüglich der sozialen Organisation wurde mir folgendes mitgeteilt:

Initiationszeremonien hat es gegeben. Das Fest der ersten Menstruation fiel mit der Hochzeit ursprünglich zusammen. Am ersten Menstruationstag kam das Mädchen in einen eigens für diesen Zweck gebauten Pontok. Dann wurde zwei bis drei Tage getanzt, und nach Abklingen der Menses begab sich das Mädchen zur Werft des Mannes und nahm das eheliche Leben auf. Jetzt fallen erste Menstruation und Hochzeit nicht mehr immer zusammen.

Die Zustimmung des Mädchens zur Eheschließung ist unbedingt nötig. Man verlobt sich oft schon im Kindesalter. Ist das Mädchen „groß", d. h. geschlechtsreif geworden, so begibt sich der Freier zu den Eltern des Mädchens. Weder die Braut noch der Bräutigam dürfen die Werften ihrer zukünftigen Schwiegereltern betreten. Sind Vater und Mutter einverstanden, dann gehen diese zu den Großeltern, um deren Zustimmung einzuholen. Dann werden Ochsen, Hammel und Ziegen für das Fest gesammelt. Sodann begibt sich der Freier zu seinen Eltern, die ihrerseits auch die Großeltern befragen. Auch im Hause des Bräutigams wird nun Vieh gesammelt bzw. erbettelt und gekauft. Dann beginnt ein großes Fest. Es wird getanzt und aus langen Trompeten geblasen.

Im Hochzeitsreigen singen die Männer:

„Huwi é haa – huwi é taa – huwi âni taa." (Das Mädchen ist groß geworden.)

Die Frauen klatschen in die Hände und singen:

„Jee jeee ja! jee jeee ja!"

Eine Jünglingsweihe im eigentlichen Sinne haben sie nicht mehr. Doch wird, wenn der Junge groß geworden ist, ein Fest gemacht und Vieh geschlachtet. Ebenso wird, wenn ein Kind geboren wird, ein Fest veranstaltet, bei dem Hammel oder Schafe geschlachtet werden. Auffallend ist, daß bei diesen Buschmännern an Stelle der Ziege gewöhnlich das Schaf tritt.

Der Junge bekommt den Namen vom Vater, die Tochter den Namen von der Mutter. Die Kinder gehören zur Familie der Frau und der älteste Onkel, oder älteste Bruder der Frau ist das Familienoberhaupt. Die Kinder von Mutters Schwestern darf man nicht heiraten.

Im folgenden gebe ich die Verwandtschaftsbezeichnungen:

Deutsch	Ukualuithi-Buschmänner	Name	Deutsch	Ukualuithi-Buschmänner	Name
Vater	//khum-khe	/gub, dadab, eib	Tochter	χ'ams-khe	/gôas/gôa
			Bruder	!gasab	!gasab
Mutter	//khums	/gus, is	Schwester	di !gas-khe	!gasas
Sohn	a χ'oron-khe	//ôab/gôb			

Deutsch	Uukualuthi-Buschmänner	Nama	Deutsch	Uukualuthi-Buschmänner	Nama
Sohn von Vaters Bruder	awób[1] !garis-khe	—	Vaters Bruder .	di khoób-khe	—
Sohn von Mutters Bruder .	/góa khoaba..	—	Mutters Bruder	khoes-khe-khoaba	—
Tochter von Vaters Bruder ..	//khum khoás	—	Vaters Schwester	di-khoaba ...	—
Tochter von Mutters Bruder ..	//khum khoás	—	Mutters Schwester ...	//khum khoás	—
			Schwägerin	//khum khoas	—
			Frau.....	tarás	—
			Mann	subá	—

Khoás (gesprochen wie quás) entspricht Khoin in Naman. Khoib bedeutet aber Mann, Mensch, Freund, und Komparativ Khoiya-Khoin = Blutsverwandte.

//Khum Khoas bedeutet also „blutsverwandte Mutter", was richtig angewendet wird auf Mutters Schwestern und deren Töchter und auf die Töchter von Vaters Bruder, sonderbarerweise auch auf die Schwägerinnen, wohl deswegen, weil auch ihnen gegenüber Heiratsverbot besteht. Vaters Schwestern und deren Töchter führen diesen Titel nicht. Diese Basen darf man auch heiraten.

SECHSTES KAPITEL

DIE !KUNGBUSCHMÄNNER

Das ganze ungeheure Gebiet zwischen Ewale, Ukuanjama, Oondonga, dem Umaramba u Owambo bis zu seinem Ursprung und von da über die Farm Buschfeld bis nördlich Otjituo und das ganze Sandfeld östlich des Omuramba Omatako bis gegen Alexeck einerseits, dem Okawango und den Wohngebieten der Bamangwato westlich des Ngamisees andererseits wird von Stämmen der !Kunggruppe bewohnt.

Seiner[2] bringt folgende zutreffende Einteilung dieser Zone:

„Das !Kungfeld bildet den der Nordkalahari angehörenden Teil der Omaheke und liegt zwischen dem Okawango (von Kagere an bis zum 19° o. Br.), dem Kaukaufeld, dem Sandfeld, dem Karstfeld, der Etoshapfanne und dem Otjimpolofeld. – Das Kaukaufeld (nach Passarge eine Hochfläche) liegt zwischen dem Kungfeld, dem Okawango, dem Okawangobecken und der Sandfeldlandschaft. Als Westgrenze, also nach dem Sandfelde hin, sei die Linie Bogara—Debra—Blaubuschpfanne im Westzipfel des Okawangobeckens, dicht an der deutschen Grenze angenommen. – Das von mir bereiste nördliche Sandfeld läßt sich nach Westen begrenzen durch die Linie Nuragas—Otjituo und durch den Lauf des Omatakotales von Otjituo bis Okahitua, nach Süden durch die Linie Okahitua—Okosondusu—Otjosonjou—Epata—Epukiro—Riotfontein-Ost, nach Osten durch die Randzone des Chanesfeldes, Okawangobeckens und Kaukaufeldes. Für die nördliche Abgrenzung nach dem Kungfelde hin ist die Berücksichtigung klimatischer und pflanzengeographischer Verhältnisse nötig, da hier eine natürliche Abgrenzung fehlt; die Linie Bogara—Kanovlei—Nuragas bildet nämlich annähernd die Nordgrenze des Kalahari-Laubes der Mittel-Kalahari, der sich scharf vom Trockenwalde der Nord-Kalahari unterscheidet. – Der lockere, tiefe, ausgelaugte Steppensand trägt einen meist hochstämmigen, meist unterholzlosen, lichten xerophytischen Trockenwald mit laubabwerfenden Bäumen, die infolge der in ihren Wurzelstöcken und Stämmen aufgespeicherten Wassermengen während des größten Teiles der Trockenzeit grünes Laub tragen und teilweise sogar während derselben Blüten und Früchte treiben; dieser Trockenwald ist eine Bildung jüngeren Datums. Die Vegetation des festen, grauhumosen, lehmigen Flußsandes bzw. des lockeren Sandes mit reichlicher Grunddurchfeuchtung und Grundwasser ist ein andersgeartetes Trockenwald, der dem Niederungswalde Warburgs entspricht und sich im Gegensatze zum lichten Trockenwald des lockeren Sandes durch eine relativ große Dichtigkeit auszeichnet. – Die Trockenwaldsteppe nimmt die größten Flächen des !Kungfeldes ein, und

[1] Vgl. dazu !awi (N.): „Das erste Kind gebären."
[2] Mitteilungen aus D. Sch. Geb. 1914.

Niederungswald und Grassteppe bilden in ihm nur schmale Einlagerungen. Im Trockenwald finden sich an jenen Stellen, an denen die Beschaffenheit des Geländes die Ansammlung und Erhaltung von relativ bedeutenden Mengen Wassers oder Grundfeuchtigkeit ermöglicht, Baumindividuen vor, die als Reste eines früheren geschlossenen Niederungswaldes zu betrachten sind, und läßt die floristische Zusammensetzung solcher Waldinseln darauf schließen, daß das ganze Gebiet mit Ausnahme der primären Grassteppen, deren Boden infolge seiner Sterilität wohl nie eine höhere Vegetation aufwies, einst von einem üppigen Niederungswalde bedeckt war, wie er gegenwärtig in seiner schönsten Form in der Nord-Kalahari und im ‚Regenwalde' der Viktoriafälle erhalten ist."

Unter den !Kungbuschleuten in engerem Sinne, die in eine Nordgruppe und eine Ostgruppe zerfallen, verstehe ich jene, welche nördlich der Polizeizone und südlich des Okawango im Ausgangsgebiete des Omuramba u Owambo am Löwenomuramba und beiderseits des unteren und mittleren Omuramba u Omatako sitzen. Die Gruppen im Quellgebiete des Omuramba u Owambo habe ich genauer studiert. Früher saßen die !Kung zweifelsohne viel weiter nach Süden und Westen. Es ist nicht unwahrscheinlich, daß sie erst unter dem Drucke der Hei//om, die ihrerseits vor den Herero das Mittelland räumen mußten, die Grootfonteiner Ebene und die Otawiberge verlassen haben. Auf der anderen Seite haben sie zweifelsohne Raum nach Süden gewonnen, denn Berichte aus der Vorkriegszeit lassen die Nogau im Sandfelde bis in die Nähe von Otjituo sitzen, während diese heute bis hinter Alexeck zurückgewichen sind. Die rassenmäßige Zusammensetzung der !Kungbuschleute gestattet einen Rückschluß auf ihre Geschichte. Wir finden unter ihnen eine größere Zahl europäider Typen als bei den umgebenden Bantustämmchen. Daneben ist australoider Einfluß deutlich, und die Südbuschmannrasse, das ist jene, welche jene Merkmale aufweist, die gemeinhin den Buschmännern insgesamt zugeschrieben werden, findet sich rein nur in einem bescheidenen Prozentsatz, der nach Süden hin zunimmt. Die !Kungbuschmänner sind im Norden ausgesprochene Wahlleute, während sie im Sandfeld den schattenlosen niedrigen Busch bewohnen. Die Oberfläche des Gebietes besteht aus Zonen weißlichen, gegen Osten und Norden zu roten Sandes, der strichweise von Oberflächenkalkstreifen unterbrochen wird. Längs des Omuramba Omatako und parallel zu ihm streichen Pseudodünen in der Richtung Nord-Nordost—Süd-Südwest, die mit dichtem Dornbusch bestanden sind. Auf den mehr tonigen Böden in der Umgebung der Omuramben steht dichter tropischer Trockenwald. Die Erinnerung an feuchtere Zeiten bilden drei oder vier riesige absterbende Affenbrotbäume.

Ludwig Zukowsky[1] berichtet über Fauna und Flora:

„Das Kungfeld, ein großes Laubwaldgebiet, das im Norden von Okawango, im Osten von dessen Überschwemmungsgebiet, im Süden vom Dusche und Schadum und im Westen vom Unterlauf des Omuramba u'Omatako begrenzt wird, will J. H. Wilhelm als besonderes Tiergebiet aufgefaßt wissen, da hier die markantesten Vertreter des Sandfeldes, Oryx, Ourebia, Bubalis, Guevei und Canis fehlen und an ihre Stelle neue Formen treten, wie Damaliscus, Schaeffia und Hippotragus. Roter Sand beherrscht die ganze Gegend, welche mit Serengen, roten Bohnenbäumen, Mokussi (Baikiaea plurijuga), Gelbholz, Dolf und wilden Apfelsinenbäumen (Strychnos Schumanniana) bestanden ist. Der das ganze Gebiet bedeckende Laubwald ist zur Regenzeit, wenn die Bäume belaubt sind, entfernt einem jüngeren deutschen Buchenwald vergleichbar. Der Hauptbaum ist der Sereng (Burkea africana) mit seinem Begleitbaum, dem Mokussi (Baikiaea plurijuga), die besonders dichte Stämme an den Ufern (Dünen) der großen Omuramben bilden. Ein weiterer häufiger Baum ist der rote Bohnenbaum (Copaifera coleosperma), das Gelbholz (Terminalia sericea), manchmal in Baumform, aber häufiger in Buschform als Unterholz auftretend. Im nördlichen Teile kommt hin und wieder der Greesappelboom (Parinarium mobola) vor und vereinzelt im ganzen Veldt der Klapperbaum oder die wilde Apfelsine (Strychnos Schumanniana) und der Dolf (Therocarpus erinaceus). Die Dünen der Omuramben sind außer mit Mokussi auch mit Kameldornbäumen (Acacia giraffa), Hackiebusch (Acacia detinens) und einem anderen Dornbusch (Acacia spec.) bestanden. Zwischen den großen Omuramben, die das Überschwemmungsgebiet erreichen (Kaudum und Schadum), ferner zwischen Okawango und Kaudum befinden sich eine Menge bald mehr erkennbarer, bald verwachsener Omuramben, wie Tschakaue, Gani, nördlich des Kaudum und südlich davon Tschaudum und Kuatschadum. Erwähnenswert ist das inselartige Auftreten der Hyphaene ventricosa bei der Wasserstelle Tschaudum, die in Baumform, wie in der Grootfonteiner Fläche, in 500 bis 1000 Exemplaren isoliert auftritt. Im ganzen Gebiet liegen viele Hackiedornbusch-Inseln und Salzpfannen, die offenes oder einen halben Meter tiefes Wasser haben und meist mit Ried (Phragmites) bewachsen sind. Die Weide ist mit Ausnahme der Omurambabetten, die, wie z. B. der Kaudum, einen sehr hohen Wasserstand von 20—50 cm Tiefe haben, schlecht. Langes, hartes Gras oder niedriger Blätterbusch [vielleicht verwandt mit dem Dichopetalum venenatum (Machau), das hin und wieder auftritt] kommen hier vor, während nur in den Dornbüschen Buschmanngras und Knäuelgras auftritt. In dem Unterholzbestand finden sich Grewiaarten. Der Boden ist

[1] Beitrag zur Kenntnis der Säugetiere Deutschsüdwestafrikas. Arch. f. Naturgeschichte, 90. Jg., 1924. Abt. A, Heft 1.

3: Lebzelter FX10 Bushmen

nur Regenzeit mit Stachelkürbis (Citrullus Naudinianus) bedeckt, unter dem Hackienbusch wachsen Onkies (Cyperus usitatus). Außerdem kommen eine Menge Sträucher vor, die in der Regenzeit schmackhafte Beschkost tragen. Es fehlt der Affenbrotbaum (Adansonia digitata), dessen erste Vertreter nördlich von Dewigna im Kaukaufeld erscheinen, der Marulabaum (Sclerocarya Schweinfurthiana), der Mangettibaum (Rizinodendron Rautanenii) und der Hartekohlbaum (Combretum primigenium). Brackpfannen fehlen, dafür sind im Kaudum und Schadum an manchen Stellen Salzausblühungen. Der Boden ist mit rotem Sand (Fuchssand) bedeckt, der in den Dornbuschbeständen in festen, grangelben, vielleicht tonhaltigen Sand übergeht. Kalkklippen und sonstiges Gestein fehlt vollkommen. Das Kaudumbett ist mit grünem Gras dauernd dicht bestanden. Die Sandpfannen führen humosen Sand, nur im Nordosten bei Schematura ist ein torfartiger Moorboden mit rotem, stark eisenhaltigem Wasser zu finden. Waldbrände gehören zur Tagesordnung, schädigen aber wenig den Baumwuchs."

Südlich des Omuramba u Owambo finden sich in ziemlich großer Zahl Kalkpfannen, die zum Teil noch Wasser führen, zum größten Teil aber ausgetrocknet sind. Der Austrocknungsprozeß des Landes ist daselbst nach den Aussagen der Buschmänner wie der Europäer in raschem Fortschreiten begriffen. In der Regenzeit sind die tonigen Böden versumpft, und dann ist der dichte Buschwald mit Myriaden von Stechmücken erfüllt, und die Malaria fordert bei allen Rassen ihre Opfer. Die ungesunde Lage, die Schwierigkeit der Arbeiterbeschaffung und die Unregelmäßigkeit des Regenfalles haben bewirkt, daß der größte Teil der außer Grootfontein liegenden Farmen wieder verlassen wurde, so daß die Buschmänner dort tatsächlich Raum gewonnen haben. Die !Kungbuschmänner außerhalb der Polizeizone leben völlig nach ihren alten Sitten und Gebräuchen. Die einzelnen Sippen stehen sich zum Teil feindlich gegenüber. Eine Art Erbfehde besteht gegenüber den Hei//om, auf die häufig Überfälle der Weiber wegen gemacht werden. Mit den Farmen an der Nordgrenze (Duwib, Keitsas, Keibeb, Kuntsas, Neitsas, Foxhof) leben die !Kung in guten Beziehungen. Viele von ihnen arbeiten zeitweilig, manche dauernd dort: insbesondere Frauen und Kinder lassen sie gerne auf der Farm arbeiten. Mister Cleark, der Besitzer von Keibeb, hat eine größere Zahl von ihnen zum Holzkohlenbrennen angelernt. Diese Buschmänner machen draußen in der Wildnis die Holzkohle und liefern sie ab. Die Holzkohle wird dann an die Motramitmine in Abenab weiterverkauft. Bis zur Einrichtung der Polizeizone bestand ein fortwährender Krieg zwischen der Polizei und den Buschmännern. Zwischen den Herero von Otjituo und den !Kung kommt es immer wieder wegen der Viehdiebstähle zu Kämpfen. Die Herero attackieren die Buschmänner zu Pferde und erschlagen sie vom Sattel aus mit dem Kiri.

Die Buschmänner, welche nicht gewohnt sind, auf rasch bewegliche Ziele zu schießen, ziehen dabei meist den kürzeren. Die !Kung, die im Sandfeld östlich des Omuramba u Omatako sitzen, stehen ebenso wie die Nogau den Weißen feindlicher gegenüber, und dementsprechend ist auch die Haltung der Weißen und Farmeingeborenen. Ihre Erklärung findet diese Haltung darin, daß die Buschmänner aus dem Gebiete westlich Omuramba erst vor kurzer Zeit verdrängt wurden und nun den kargen Lebensraum ihrer Brüder östlich des Trockenbettes bedeutend einschränken. Die Lebensbedingungen in diesem Gebiete sind hoffnungslos. Mit den Stämmen am Okawango leben die !Kung in Symbiose. Ohne eine feste soziale Organisation, ohne feste Wohnsitze im engeren Sinne ist der Buschmann viel weniger greifbar als etwa die schwarzen Bauern. Die Kollektivhaftung des Stammes, welche den besten Schutz des Europäers bildet, läßt sich den Buschmännern gegenüber nicht anwenden, und die Wahrscheinlichkeit, einen Buschmannes, der am Rande der Polizeizone oder außerhalb derselben ein Verbrechen begangen hat, habhaft zu werden, ist gleich Null. Dies muß man sich im Verkehr mit ihnen vor Augen halten. Ich habe freilich mit ihnen keine schlechten Erfahrungen gemacht.

DIE BIOLOGISCHEN GRUNDLAGEN DES VOLKSLEBENS

1. DIE ZAHL

Seiner hat die Zahl der !Kung mit etwa 12000 angenommen. Seither haben sowohl die Kriege 1914/15, wie auch die fortdauernde Verschlechterung der Wasserverhältnisse die Vermehrung stark gehemmt, so daß ihre Zahl in den letzten zwanzig Jahren sicher nicht gestiegen ist.

Die soziale Grundlage des Volkes bildet die im wesentlichen patriarchalische Familienhorde, welche im Durchschnitt aus ein oder zwei alten Männern, vier bis sechs erwachsenen Männern, ebensoviel gebärfähigen Frauen und einigen alten Matronen besteht; dazu kommen dann die Kinder. Gegen Ende des Winters sammeln sie sich bei den wenigen übriggebliebenen Wasserstellen in großer Menge, versammeln sich dann von dort aus zur Zeit der ersten Feldkostreife an bestimmten Stellen oft zu mehreren Hundert, um sich bei Einsetzen des Sommers wiederum in kleinen Gruppen auf ihren Familiengrund zu begeben. Als Beispiel gebe ich vier Horden, deren ungefähre Altersgliederung ich feststellen konnte:

	Horde I	Horde II	Horde III	Horde IV
Männer	9	7	4	10
Greise	—	—	4	1
Frauen im gebärfähigen Alter	10	12	12	9
Matronen	4	9	7	6
Säuglinge	4	4	7	2
Kleinkinder:				
1–4jährige Knaben	2	3	8	3
1–4jährige Mädchen	3	4	4	1
Kinder:				
5–10jährige Knaben	4	4	?	?
5–10jährige Mädchen	3	2	?	?
Jugendliche Männer	5	—	?	?
Jugendliche Mädchen	3	3	?	?

Die vorliegende Tabelle bezieht sich also auf 44 gebärfähige Frauen und auf 38 Ehen, davon 2 polygame. 4 sind Witwen. Auf diese 38 Ehen kommen 15 Säuglinge, meist unter einem Jahr. Schwanger waren, soweit man sehen konnte, noch 12 Frauen, etwa 5 davon mit älteren Säuglingen. Es scheint demnach, daß das Stillen über ein Jahr hinaus keinen praktischen Schutz gegen eine neue Konzeption gewährt.

Die bei den Nog-au in Kraft stehende Vorschrift, die eine neuerliche Kohabitation mit der Mutter erst gestattet, wenn das Baby sitzen kann, ist wohl bekannt, wird aber nicht sonderlich beachtet.

Diesen 15 Säuglingen sollten 45 Kleinkinder von 1–4 Jahren entsprechen; tatsächlich sind aber nur 30 vorhanden, was einer Säuglingssterblichkeit von 33% entspricht. Sie ist nicht höher als bei Primitivstämmen in Malariagebieten zu erwarten, ist sogar niederer als in manchen Eingeborenenkohabitationen wie etwa in East London.

In der Altersklasse von 5–10 Jahren bleibt die Zahl gleich.

Die Sterblichkeit ist also sehr nieder, wie bei uns, ja noch niedriger, weil ja die gefährlichen Infektionskrankheiten des Kindesalters fehlen. Soweit die geringen hier gegebenen Zahlen einen Schluß gestatten, ist das Geschlechtsverhältnis 1:1. Wie das Geschlechtsverhältnis bei den Erwachsenen ist, läßt sich nicht sagen. Ein großer Teil der Männer verschwand bei meinem Eintreffen – hatten doch die meisten ein schlechtes Gewissen und wünschten weder metrisch noch photographisch festgehalten zu werden. Aber daß mit steigender Altersklasse der Frauenüberschuß steigt, ist wohl klar.

An grauhaarigen greisenhaften Individuen, die wohl über 60 Jahre alt sind, habe ich bei den vier hier angeführten Horden 4 Männer und 13 Weiber gezählt, also ein Verhältnis 1 : 3. Wie bei uns erreichen also auch dort die Frauen durchschnittlich ein höheres Alter.

C. v. François[1] schätzte auf seiner Reise zum Okawango 1891 die Bevölkerung des Gebietes auf 500 Honigkaffern und Hei//om, 2000 !Kung und 10000 Okawangos. Nördlich des Okawango, zwischen dem Kuando und Cuito sollte der Buschmannstamm der Wassecker wohnen. Er nennt den Häuptling der Nord-!Kung den besten Kenner des Landes, welcher ihm versicherte, daß die Wasserverhältnisse früher viel besser gewesen seien. Viele der jetzt trockenen Vleys hatten früher das ganze Jahr Wasser. Der Okaluombe (Apato) soll früher zum Ngami abgeflossen sein.

Theodor Leutwein[2] berichtet:

„Nördlich Grootfontein an dem wasserreichen Platz Gaub hatte sich noch eine Anzahl Kaffern und Buschmänner zu einer Werft zusammengetan und sich in einem Hererobastard namens Krüger ein Oberhaupt gegeben, das in seiner Würde bestätigt wurde" (s. S. 87). „In Naldeus stellte sich ein Buschmannvormann namens Arlitik vor, der ähnlich wie Krüger im Osten als Kapitän der Buschmänner des Westens anerkannt wurde" (S. 88).

„Bei der Reise des Hauptmanns Volkmann im Jahre 1903 zum Okawango leisteten die !Kung-Buschmänner weitgehende Hilfe. Volkmann beschreibt diese !Kung folgendermaßen: ‚Die Buschmänner, die fast unbekleidet sind, sind sehr empfindlich gegen die Kälte. Morgens hat jeder Buschmann ein brennendes Holzscheit in der Hand, das dicht vor die Brust gehalten wird. Die andere Hand liegt mit dicht an den Leib gepreßtem Oberarm auf der Schulter. Am Halteplatz wird das Holzscheit gleich zum Feuermachen benutzt. Geht ein Buschmann als Führer vor dem Pferde, so springt er mit unglaublicher Schnelligkeit bald hierhin bald dorthin, irgendeine Knolle oder Wurzel aus der Erde zu holen. Sehr beliebt sind auch verschiedene Beerenfrüchte, die an niederen Sträuchern wachsen. Als Tabakpfeife wird alles mögliche benutzt: Kudubörner, Kalebassen, ausgehöhlte Früchte des Strychnos, alte Patronenhülsen aus Metall usw. Am liebsten rauchen sie durch Wasser, das nie erneuert wird. Geht der Tabak aus, dann kochen sie die Rinde eines Baumes in dem dickflüssigen Tabakwasser, trocknen dann die Rinde, die etwas Tabakgeschmack annimmt, und rauchen sie'" (S. 180).

F. Seiner berichtet über die Einteilung dieser Stämme:

„Die Kung zerfallen nach unserer bisherigen Kenntnis in vier Gruppen. Die westliche scheint sich von der portugiesischen Grenze bei Kurinkuru längs des Weges über Tschitschib bis an den Omuramba u Owambo hinzuziehen und dann durch diesen, sowie im Osten durch die Linie Nuragas—Blockfontein begrenzt zu sein. Die östlich angrenzende Gruppe von Karakuwisa bewohnt in der Trockenzeit das Tal des Omuramba u Omatako von Karakuwisa bis Blockfontein, sowie in der Regenzeit die Steppen 100—150 km östlich und westlich des Omuramba und diesen selbst bis zur Kanovlei. Die südlichere Gruppe zieht sich von der letzteren im Omuramba bis annähernd Osondema entlang; wir wollen diese Nog-au, die bereits in der Mittel-Kalahari sitzen und kaum den Bastard-Buschleuten beigezählt werden können, Otjitnogruppe benennen. Im Gelände westlich des Omatakotales von Okanakasewa bis Omambonde hausen angeblich die Gam. Das schwerste Anklagematerial liegt gegen die westliche Gruppe vor, die nach Meinung des Bezirksamtes großenteils unter einem einzigen Oberhäuptling, dem berüchtigten Namagorub, stehen soll, und von den übrigen Buschleuten !Kung-au (d. h. !Kungleute) genannt wird. Von den Karakuwisa-Häuptlingen sind erwähnenswert Gnami und Ma, beide verkrüppelt, ferner die Führer der Einbrecher von Blockfontein, Gacha und dessen Bruder Tamburi; dem berüchtigten Namagorub kommt keiner an Einfluß gleich."

In den Urwäldern südlich des Otjimpolofeldes soll nach Vedder der Buschmannstamm der Masi-Keren wohnen. Diese verstehen nicht die !Kungsprache, wohnen gemeinsam in großen viereckigen Häusern und machen sich Einschnitte in den Oberschenkel, um besser laufen zu können. Ihre Pfeile haben große Eisenspitzen, die nicht vergiftet sind.

2. ZUR CHARAKTEROLOGIE

Die Buschmänner sind untereinander dem Charakter nach ebenso verschieden wie die Angehörigen irgendeines anderen Volkes. Schon die verschiedenen Habitustypen weisen darauf hin. Ich möchte Individualcharakteristiken bei der relativ kurzen Zeit, die ich mit den einzelnen zusammen war, keine übermäßige Bedeutung zubilligen. Der Charakter eines Volkes, wenn man von einem solchen sprechen

[1] Mitteilungen aus den deutschen Schutzgebieten, IV, 1891.
[2] Elf Jahre Gouverneur in Deutsch-Südwestafrika. Berlin 1906.

kann, äußert sich in der durchschnittlichen konventionellen oder traditionellen Art des Reagierens unter verschiedenen Bedingungen, welche trotz der physisch bedingten Charakterunterschiede doch eine gewisse generelle Einheitlichkeit aufweist.

Da ich bei den anderen Buschmannstämmen weniger eingehende Beobachtungen machen konnte, bringe ich hier alles, was ich im Gegenstande beobachtet habe.

Neuen Eindrücken gegenüber verhält sich der Buschmann zunächst ziemlich uninteressiert. Die Neugier ist gering. Wohl haben einmal zwei !Kungbuschleute von mir eine eingehende Erklärung des Motors verlangt und geduldig angehört. Als ihnen einmal ein Amerikaner ein Grammophonkonzert gab, hörten sie dieses mit sichtlichem Wohlgefallen an, es fiel aber keinem ein, über das Wesen dieser Sache eine Frage zu stellen. Die Buschmänner von heute zumindestens glauben nicht, daß sich in den Maschinen der Europäer irgendeine Zauberei verberge. Europäische Instrumente lernen sie ziemlich rasch gebrauchen, insbesondere das Gewehr wird ihnen rasch vertraut. Dornan berichtet ja auch von einer großen Zahl improvisierter Gewehre, welche die Buschmänner adaptiert hatten. In neuer Umgebung ist der Buschmann seinem ganzen Wesen nach blasiert und kühl beobachtend. Anpassungsfähig ist er in hohem Grade. Die Buschmädchen, die manche Farmer zu Konkubinen haben, spielen ganz geschickt Hausfrau. Im Ovambolande nehmen sie rasch die Lebensgewohnheiten und die Wirtschaftsformen der Bantu an. Am Lehrerseminar in Oonipa ist ein Ongandjerabuschmann als Lehrer tätig. Er besitzt einen kleinen, nett gehaltenen Kraal nach Ovamboart und hat sich außerdem eine Ziegelrundhütte gebaut, in der er seine „Bibliothek" aufbewahrt. Auf den Farmen halten sie selten lange aus, hauptsächlich aber wohl, weil ihnen die Nahrung nicht bekommt. Anderen Menschen gegenüber sind die Buschmänner im höchsten Grade mißtrauisch. Jeder Bewaffnete, dem sie begegnen, gilt von vornherein als Feind. Fremde Stammesgebiete darf der Buschmann nur unbewaffnet betreten. Selbst am Rande der Farmzone ist das gegenseitige Mißtrauen so groß, daß ein Buschmann, der als Bote auf eine Farm geschickt wird, in derem Bereich eine andere Sippe sitzt, den Fahrweg, der als eine Art neutrale Zone gilt, nicht zu verlassen wagt. Nähern sich zwei fremde bewaffnete Buschleute einander, so legen sie zunächst auf Sichtweite die Waffen ab, um sich dann erst zu begrüßen. Kommt ein Buschmann zu einer Werft oder zu einem Farmhause, so legt er in einer gewissen Distanz die Waffen ab und setzt sich dann nieder und wartet geduldig, eventuell stundenlang, bis er gefragt wird. Ein ausgesprochenes Rassenempfinden ist nicht deutlich. Alles, was nicht zur eigenen Sippe gehört, wird als fremd, eventuell feindlich angesehen, es sei denn, daß gemeinsame Verfolgung ein Solidaritätsempfinden unter allen Verfolgten aufkeimen läßt. Dagegen haben sie ganz deutlich eine Art Menschheitsempfinden, d. h. sie glauben nicht, daß sie die eigentlichen Menschen sind, und sind z. B. überzeugt, daß im Himmelshause die Menschen aller Rassen Aufnahme finden. Das Verhalten den Verwandten gegenüber ist durch zahlreiche Sitten geregelt, im allgemeinen aber selbst der Frau und den Kindern gegenüber gemessen und fast zeremoniell. Aufdringlich ist der Buschmann niemals.

Von den übrigen Völkern werden die Buschmänner als Ganzes verachtet, im einzelnen aber gefürchtet, nicht zuletzt auch von den Weißen. Die Buschmänner kennen diese Einstellung und verhalten sich dementsprechend.

Auf fremde Ansichten gehen die Buschmänner schwer oder gar nicht ein. Die Mission hat bei ihnen auch keinen nennenswerten Erfolg zu verzeichnen. Dagegen erfassen sie durchschnittlich rascher die Absichten anderer als die gewöhnlich oberflächlicheren Schwarzen. Sie geben infolgedessen auf die an sie gestellten Fragen kurze und präzise Antworten. Bei Fragen, die sie nicht beantworten wollen, schweigen sie. Man muß allerdings im Verkehr mit ihnen beachten, daß sie bei geistiger Arbeit sehr rasch ermüden und dann keine Antwort mehr geben, nicht weil sie nicht wollen, sondern weil sie bereits zu müde sind.

Freigebig sind die Buschmänner nicht. Einen Fremden an der Mahlzeit teilnehmen zu lassen, sowie ihm auch von dem vorhandenen Wasser zu geben, ist allerdings eine glatte Selbstverständlichkeit. Von ihrem personellen Besitz an Waffen, Schmuck, Fellen usw. geben sie aber sehr selten etwas als Geschenk ab. Erhalten sie selbst Geschenke, so zeigen sie sich deutlich erfreut. Mit Worten wird

freilich der Dank nicht ausgedrückt, aber wer den Buschmännern Wohltaten erweist, kann sicher sein, daß sie ihm bis zur Selbstaufopferung Dankbarkeit durch die Tat beweisen werden.

Dem Mitmenschen, der in Not geraten ist, zu helfen, ist ein moralisches Gebot. Es wird von einem Prospektor berichtet, der sich im Buschwald verirrte und dann von den Buschmännern, mit denen er nicht einmal reden konnte, gerettet, tagelang verpflegt und schließlich auf den rechten Weg gebracht wurde.

Verabredungen und Versprechungen hält der Buschmann unbedingt ein, freilich kommt er meistens etwas zu spät. Als einmal der Ochsenwagen der katholischen Mission auf dem Wege zum Okawango einen Ochsen zurücklassen mußte, überließ man ihn den Buschmännern mit dem Bemerken, man würde ihn zur Zeit des nächsten Vollmondes abholen. Die Leute hielten Wort, und der Ochse wurde gut gefüttert terminmäßig abgeliefert.

Als Kamerad ist der Buschmann verläßlich und treu[1]. Die Buschmänner sind, was ja schon ihre Lebensweise mit sich bringt, durchwegs mutige und entschlossene Leute.

Die Buschmänner vermeiden es in Gegenwart der Frauen und Kinder streng, über sexuelle Dinge zu reden. Wie sie überhaupt ein Volk ohne jede Phantasie sind, fehlt ihnen auch jede subtilere erotische Phantasie.

Die endlosen obszönen Geschichten, die man von den Schwarzen zu hören bekommt, sobald man einmal ihr Vertrauter ist, sind bei den Buschmännern unbekannt.

Ihren religiösen Festen fehlt die sexuelle Note, wohl aber kommt diese bei vielen ihrer Tänze zum Ausdruck, die Liebesspiele von Tieren imitieren.

Im ganzen ist ihnen ja Schamhaftigkeit nicht abzusprechen, wenn sie natürlich auch keine solchen dezenten Umgangsformen haben wie vornehme Bantu, wo es als höchst unschicklich gilt, auf die Brüste der Frauen zu sehen, und wo die Mädchen niemals, ebensowenig wie die Frauen, die typische Hockerstellung einnehmen, sondern mit schräg aufeinandergelegten Beinen auf dem Boden sitzen.

Trotzdem sich das Leben der Buschmänner innerhalb der Werft vor aller Augen abspielt, werden doch jene Grundsätze eingehalten, die wir als natürlichen Takt betrachten.

Seine Bedürfnisse besorgt der Buschmann immer ungesehen von den anderen, und Liebesszenen werden niemals vor den übrigen gemacht.

Es ist natürlich sehr schwer, über das intimere Geschlechtsleben Genaueres zu erfahren, ohne sich dabei selbst bloßzustellen. Als Gewährsmänner kommen nur alte Leute in Frage, die nicht mehr renommierrichtig sind.

Bei dem harten Leben, das die Leute führen, ist die Sexualität natürlich nicht übermäßig entwickelt. Perverse Manipulationen sind offensichtlich unbekannt, da meine Gewährsmänner diesbezügliche Fragen überhaupt nicht verstanden.

Der normale Geschlechtsverkehr wird meist in der Zeit zwischen dem Abendessen und Mondaufgang im Busch vollzogen. Nach längeren Durstperioden tritt fast völlige Impotenz ein.

Trotz aller Gemessenheit haben sie ein ungezügeltes Temperament, das sich oft aus nichtigen Anlässen in schweren Affektausbrüchen äußert, die dann, da ja der Giftpfeil immer zur Hand ist, leicht üble Folgen haben können. So wurde mir folgende Geschichte erzählt: Ein Buschmann ging längere Zeit auf eine Farm arbeiten und kam mit einem prallen Maisbauch zu seinen mageren Gefährten. Sein Bruder verhöhnte ihn, weil er so dick sei, daß er nicht mehr laufen könne, worauf der Dicke replizierte: „Dafür werde ich länger leben als du." Der magere Bruder erstach nach diesem kurzen Wortwechsel den dicken. – Einmal wollte eine Filmgesellschaft bei den !Kung, die hinter Keibeb sitzen, einen Film drehen: „Als die ersten Weißen ins Land kamen." Nun hatte aber der Häuptling dieser Horde eine

[1] Ein Europäer hatte sich einmal einige Bäumchen widerrechtlich angeeignet und vor seinem Hause angepflanzt. Als derselbe nun einmal mit seinen Buschmännern in der Stadt weilte, erklärte der ursprüngliche Besitzer der Bäume, er werde am Nachmittag zu dem Betreffenden hinfahren. Die Buschmänner hörten dies und verschwanden. Als nun die beiden Weißen auf die Farm kamen, waren auch die Bäumchen verschwunden. Die Buschmänner waren vorausgelaufen und hatten sie aus eigener Initiative eiligst entfernt.

alte deutsche Militärhose als Abzeichen seiner Würde, und die Aufforderung, sie abzulegen, beantwortete er mit der Erklärung, er würde erst dann seine Hose ausziehen, wenn auch der Weiße dies täte; er faßte dafür eine Ohrfeige, die ihn und seine Gefährten in eine derartige Wut versetzte, daß die Filmgesellschaft es vorzog, abzureisen, um eine Katastrophe zu vermeiden. Daß sie auch schlagfertig sein können, erweist folgende Geschichte, die mir wiederholt von Europäern erzählt wurde: Ein Buschmann war wegen Jagdfrevel angeklagt. Der Magistrat fragte ihn: „Weißt du nicht, daß diese Tiere dem König gehören (royal game)?" Der Buschmann antwortete: „Ich habe keinen ‚Brand' (Eigentumsmarke) gesehen."

Als Häuptling oder Familienoberhaupt ist der Buschmann herrisch und unnachgiebig, was bei der Starrheit seiner ganzen Lebensauffassung verständlich ist. Die kranken Buschmänner liegen schweigend und geduldig da, doch zerstört ein Krankheitsfall in einer Werft die gute Stimmung bei allen Mitgliedern, teils aus Mitgefühl, teils aus Angst vor den Krankheitsgeistern. Die angeführten Verhaltungsweisen gestatten bereits Rückschlüsse auf die Struktur der psychologischen Persönlichkeit bei den Buschmännern. Es ist gewiß nicht möglich, die Geisteshaltung eines intellektualisierten, hochdomestizierten Europäers mit jener dieser primitiven Jäger zu vergleichen. Aber es besteht zwischen dem einfachen Europäer und den Eingeborenen prinzipiell kein Unterschied in der Lebensauffassung und in der Art, auf die Milieueinwirkungen zu reagieren. Wie ich an anderer Stelle schon ausgeführt habe, können wir von einem Trägheitsgesetz in der Kulturentwicklung[1] sprechen. Es ist dem Primitiven vielleicht instinktiv, vielleicht traditionell klar im Bewußtsein, daß das jedem Individuum innewohnende Energiequantum begrenzt ist und jeder Energieaufwand Abnützung der Lebensmaschine und damit Lebensverkürzung bedeutet. Das Individuum sucht daher mit dem geringstmöglichen Energieaufwand zu einer nach seinen Begriffen optimalen Anpassung an die Lebensbedingungen zu gelangen und diesen Anpassungszustand bei geringstem Energieaufwand beizubehalten. Der große Unterschied gegenüber der europäischen Zivilisation und vielen Primitivkulturen, auch jener der Buschmänner, besteht aber darin, daß die europäische Kultur als Ganzes sich in einem labilen Zustand befindet, die nur einem geringen Teil ihrer Träger die Erreichung eines optimalen Anpassungszustandes ermöglicht. Die Buschmannkultur stellt jedoch einen optimalen Anpassungszustand dar, der von jedem einzelnen Buschmann automatisch erreicht werden kann. Sie ist in ihrer Art also vollkommener als die unsrige. Kein anderes Volk und keine andere Rasse könnte bei den gleichen technischen Behelfen und den gleichen Milieubedingungen eine bessere Anpassung erzielen. Man kann jedoch auch in bezug auf die geistige Kultur von einer solchen Anpassung sprechen. Das Leben des Buschmannes ist durch seine traditionellen Vorstellungen im Diesseits und Jenseits festgelegt, und die Erhaltung der Anpassung sowohl auf geistigem wie materiellem Gebiete wird durch eine strenge Auslese aller von außen angebotenen Kulturgüter bewirkt. Diese Auslese erfolgt bewußt. Kurz gesagt: Die Buschmänner haben nicht deswegen höhere Wirtschaftsformen bisher abgelehnt, weil sie hierzu nicht die Fähigkeit besitzen, sondern weil sie sie nicht annehmen wollten. Brechen die materiellen Voraussetzungen zusammen, dann nehmen sie schrittweise oder auf einmal völlig andere Lebensformen an, wie ihre Bantuisierung im Owambolande und wohl auch die Bildung des Hottentottenvolkes durch Annahme der Viehzucht seitens einiger Buschmannstämme erweist. Ihre durchschnittliche Intelligenz ist nicht geringer als die irgendeiner anderen Rasse. Jeder Buschmann kennt den ganzen geistigen Besitz seines Stammes.

Von denselben Buschmännern sagt F. Schinz[2]:

„Der Buschmann ist seinem Herrn stets treu und folgt diesem ohne Bezahlung auch überall hin; man kann ihn unbesorgt allein beim Wagen zurücklassen und wird selten in den Fall kommen, ihn einer Unredlichkeit zeihen zu müssen. Von allen Reisenden und Jägern wird übereinstimmend die große zwischen Eltern und Kindern bestehende Anhänglichkeit gerühmt, die so weit geht, daß sich der Vater oder die Mutter, um ihr Kind zu retten, selbst preisgebrt. So erzählte mir

[1] V. Lebzelter, Persönlichkeit und Weltanschauung bei den Eingeborenen Südwestafrikas. Jahrbuch der Österreichischen Leopoldgesellschaft 1932.

[2] F. Schinz, Deutsch-Südwestafrika. Leipzig 1891.

der Jäger L., daß er einst am Okavango Zeuge gewesen sei, wie ein junger Buschmann, der im Gefolge des Jagdzuges war, Gefahr lief, von einem gereizten und heranstürmenden Elephanten zertreten zu werden. Im letzten Augenblick, als die erstarrten Gefährten den Jungen schon für unrettbar verloren halten, springt der Vater desselben hervor und schleudert die Wurfaxte dem gewaltigen Tier vor die Stirn; der Elephant wendet sich gegen seinen neuen Angreifer und zermalmt diesen mit Wut unter seinen Füßen, wodurch der Sohn Gelegenheit erhält zu entfliehen."

Meine Beobachtungen decken sich völlig mit jenen Dornans[1] über die Kalahari-Buschmänner, welcher ausführt:

„Es ist behauptet worden, daß die Buschmänner kein Gefühl füreinander hätten. Ich habe oft gehört, daß die Mütter grausam gegen ihre Kinder wären und sie gelegentlich töten, wenn ihnen ihre Last zu groß wird. Soweit ich sehen kann, ist das nicht wahr. Ich habe oft Buschmannmütter ihre Kleinen küssen sehen, genau wie die Europäerinnen tun, und wenn die Kinder krank sind, dann geben sie sich alle Mühe. Die Väter sind zwar oft schroff und grob, aber nie brutal zu den Kindern. Die Mädchen sieht man gewöhnlich in Gesellschaft der Mütter, die Jungen bei den Männern. Zwischen Mutter und Tochter besteht ein enges Vertrauensverhältnis. Es ist auch behauptet worden, die Buschmänner seien undankbar; auch das ist nicht wahr. Sie zeigen ihr Dankgefühl weder gegeneinander noch gegen die Weißen; aber wer durch freundliches Vorgehen ihr Vertrauen gewinnt, der kann sehen, daß sie dankbar sind. Sie zeigen ihre Dankbarkeit nicht durch Worte, sondern durch Taten. Wenn einer in Not oder Gefahr ist und ein Buschmannfreund ist in der Nähe, so wird er bei ihm durchhalten bis zum bitteren Ende."

Der !Kungbuschmann im besonderen ist weit mehr Verstandes- als Gemütsmensch. Die außerordentliche Schwierigkeit, sich den Lebensunterhalt zu verschaffen, macht ihn sehr selbständig in seinem Denken. Es war überraschend, mit welcher Sicherheit nicht nur Männer, sondern auch Frauen dolmetschen konnten; während es bei den Bantus schwierig ist, die Konversation bei der Sache zu halten, bleibt der Buschmann eigentlich immer sachlich. Selbst die Stammestraditionen, soweit sie sich auf ihre abergläubischen Vorstellungen beziehen, sind nicht vor der Skepsis des einzelnen bewahrt. So fragte ich einmal einige Buschleute, ob sie Löwen jagen. Sie verneinten dies, und als ich sagte, daß käme wohl daher, weil in den Löwen die Geister verstorbener großer Buschmänner seien, lachten sie und meinten, das sei bloß eine Erzählung der Hei//ombuschleute und einiger Buschmanndoktoren, die das von ihnen gelernt hätten. Andere Männer desselben Stammes waren aber fest überzeugt, daß in den Löwen die Geister großer Buschmanndoktoren hausten.

Viel wird auch, speziell im Otjimpolofelde, von Buschgeistern erzählt. Aber wiederholt bemerkten meine Gewährsmänner, sie wüßten nicht, ob das wahr sei, denn sie hätten noch keine gesehen. Ein gewisser trockener Humor würzte ihre Unterhaltung. So sagte ich einmal einem Buschmann: „Wenn du mir das sagst, dann bekommst du, was du willst." Er antwortete: „Gut, ich spreche und du gibst mir dein Automobil." Sehr traurig sieht es mit ihrer Phantasie aus. Dazu sind sie viel zu scharfe Naturbeobachter. Einmal kam eine junge Buschmannfrau mit 2 Kindern zu mir und wollte Zucker kaufen. Ich sagte ihr: „Verkauft wird nichts, aber du bekommst den Zucker, wenn du mir Kindergeschichten erzählst, z. B. von Tieren." Nach einigem Zögern begann sie die Geschichte von Arri, dem Perlhuhn. Aber das war kein Märchen, sondern eine ins Detail gehende Naturgeschichte dieses wichtigen Nahrungsvogels. Sie ahmte auch die Rufe des Perlhuhns nach, „z. B. wenn jemand kommt und Gefahr ist, dann sagen sie, gannana he gannana he, wenn sie aber unter sich sind und sich freuen, dann machen sie gi gi gi". Die Kinder mußten das nachmachen, bis sie den Laut gut imitieren konnten. Dann kam das Sandhuhn daran, das spricht: gi gänna gi ganna. Dann der Strauß, der macht: hmm, hmm, hmm, dann der Harzvogel, der spricht: hai-dschi, hai-dschi und die Eule: mhm, m.

3. HALTUNG, BEWEGUNG, AUSDAUER

Infolge seiner starken Lordose nimmt der Buschmann beim Stehen nie eine Haltung ein, die unserem militärischen Haltungsideal entsprechen würde; er steht so gut wie immer mit etwas vorgehaltenem Bauch.

Das Laufen der Buschmänner ist sehr eigentümlich und würde eine genaue Untersuchung mit

[1] Dornan, Pygmies and Bushmen of the Kalahari. London 1925.

Zeitlupe rechtfertigen. Ihr Lauf ist eigentlich ein andauernder Schnellschritt, bei dem zwar nach vorwärts ausgegriffen wird, jedoch die Unterschenkel niemals hoch nach rückwärts geschlagen werden, wie dies bei unseren Läufern der Fall ist. Der Rumpf wird hierbei möglichst aufrecht gehalten, der Kopf nach oben und nicht nach vorwärts[1].

Die Sitzstellung des Buschmannes ist die bei so vielen Primitivvölkern bekannte und wohl ursprünglich allgemein menschliche Hockerstellung. Es besteht allerdings insoweit ein Unterschied gegenüber den Schwarzen, als diese meist so hocken, daß die Sitzbeinknochen den Boden nicht berühren, während das bei den Buschmännern der Fall ist. Infolgedessen krümmen sie den Rücken beim Hocken ziemlich stark und müssen die Beine ziemlich weit auseinanderspreizen.

Der schlafende Buschmann liegt zusammengerollt auf der rechten oder der linken Seite. Die Kinder schmiegen sich beim Schlafen alle an die Mutter. Die Muskelkraft der Buschmänner ist sehr gering. Die Dynamometermessungen, die ich vorgenommen habe, zeigen, daß die Druckkraft erwachsener Männer geringer ist als die europäischer arbeitender Frauen; sie beträgt nur zwischen 30 und 40 kg, während europäische Frauen auf etwa 60 kg, leicht arbeitende Männer auf durchschnittlich 80 kg kommen und europäische Schwerarbeiter und die Schmiede bei uns 120 und mehr Kilogramm im Durchschnitt erreichen. Schwarze Schwerarbeiter erreichen im Durchschnitt auch bloß 80 kg. Es ist also der Schwarze durchschnittlich doppelt, der Weiße sogar dreimal so stark wie ein Buschmann.

Dagegen besteht kein wesentlicher Geschlechtsunterschied bei den Buschmännern selbst.

Auch die Kraftleistung beim Bogenschießen der Buschmänner ist keineswegs imponierend. So gering aber ihre momentane Leistungsfähigkeit ist, so groß ist ihre Ausdauer im Marschieren. Als im Jahre 1916 der Farmer Schwarz in Neudesenberg (Keitsas) an Schwarzwasserfieber erkrankte, schickte die Frau des Farmers einen Buschmann nach Grootfontein um eine Flasche Champagner. Der Mann ging am Vormittag weg und kehrte um Mitternacht zurück. Die Strecke betrug mindestens 100—120 km, denn die Fahrstraße, die wenig Umwege macht, ist 90 km lang. (Gewährsmann Farmer Schwarz in Duwib.)

4. HABITUSTYPEN UND KONSTITUTION

Die Buschmänner sind eine ausgesprochene menschliche Wildform mit sehr grazilem Knochenbau. Eine Gruppe von ihnen, die ich als Süd-Khoin bezeichne, ist die einzige und jedenfalls vollkommenste Anpassungsform des Menschen an das Wüstenleben.

Der dort herausgezüchtete Typus läßt sich in unser Habitustypenschema überhaupt nicht eingliedern. Da derselbe zu einem erklecklichen Prozentsatz auch an der Zusammensetzung der nördlichen Waldbuschleute beteiligt ist, gibt es natürlich sehr viele Individuen, die wir überhaupt nicht in unserem Sinne klassifizieren können. Jedenfalls können wir aber – ich nehme damit einiges von den anthropologischen Ergebnissen vorweg – bei beiden Geschlechtern der !Kung einen Longitypus und einen Brachytypus unterscheiden. Besonders bei den Frauen ist es so gut wie immer möglich, die „pralle Jugendform" von der sogenannten Zukunftsform zu unterscheiden.

Ich habe an anderer Stelle die Anschauung vertreten, daß als der eigentliche Normaltypus der athletische Typus anzusehen wäre, dem gleichzeitig die Fähigkeit zum mäßigen Fettansatz eingeboren ist. Der muskulär-respiratorische Typus besitzt bei geringerer Entwicklung des Skelettes und der Muskulatur nicht die Fähigkeit zum stärkeren Fettansatz, während der digestive Typus bei gering entwickelter Muskulatur starke Fähigkeit zum Fettansatz hat.

[1] E. v. Eickstedt (Rassenkunde und Rassengeschichte der Menschheit, S. 356) sagt: „Dem Fuß wird eine besondere Querstellung zugeschrieben, die die Spur im Sand leicht kenntlich macht – ein Merkmal, das während der alten Buschmannketten vielen Tausenden dieser unglückseligen merkwürdigen Hominidengeschöpfe ihr elendes Dasein kostete. Eigentümlich ist auch der Gang der Sanidem: Sie gehen nicht, sie steigen. Stets heben sie gewohnheitsmäßig, wie zwischen den scharfen Gräsern und Dornbüschen ihrer Heimat, Knie und Füße beim Gehen empor. Das ist wie der schwankende Gang der Schiffer, natürlich ein sekundär erworbenes, kein eigentlich rassisches Merkmal."

Ich möchte das Gehen der Buschmänner doch als etwas rassenmäßig Bedingtes ansehen.

Vom athletischen Typus führt eine kontinuierliche Reihe durch die respiratorischen und digestiven Formen zu den lang- und kurzasthenischen Typen und von da zu den ausgesprochenen Kümmerlingen. Der athletische Typus stellt schon die vollkommenste Verwirklichung des in der rassenspezifischen Konstitution gegebenen Menschentypus dar.

Da die Milieuwirkungen vom Tage der Befruchtung an vorwiegend schädigender Natur sind, ist der schließlich erfaßbare Durchschnittstypus der Typus der durchschnittlichen, durch die Erbmasse bedingten konstitutionellen und der während des Individuallebens erfolgten konditionellen Schädigungen. Je schlechter die Lebensbedingungen sind, um so größer wird der Schädigungskoeffizient sein, um so mehr wird der Durchschnittshabitus dem asthenischen angeglichen. Erst die Milieuverbesserungen, die die Hochzivilisation hervorruft, läßt athletische Formen in großer Zahl ausreifen.

Die Buschmänner würden wir nach unserem Schema durchschnittlich als asthenisch, die bei entwickelten unter ihnen als respiratorisch bezeichnen dürfen. Bei vielen männlichen Individuen besteht die Fähigkeit zu bedeutendem Fettansatz, und ich habe auf Farmen auch einige Buschmänner getroffen, die sich an die Mehlnahrung angepaßt hatten und über einen recht bedeutenden Leibesumfang verfügten.

Der digestive Typus kommt unter ihnen also jedenfalls vor, wenn wir auch bedenken müssen, daß die fleischreiche kohlehydratarme Nahrung seiner Ausprägung entgegensteht.

5. DER TAGESVERLAUF

Die !Kungbuschleute teilen den 24stündigen Tag in 7 Abschnitte, diese sind:

/gam χ'á-o-a ..... Morgenrot.
/gam do di /gil .. Zeit des Sonnenaufganges.
!nâi` /kho ..... (Die Sonne) ist in der Mitte.
ha ti ʃ/náu ..... (Die Sonne) wird untergehen.
χ'á-o ti ʃ/náu .... Die Sonne schläft jetzt.
/gu gâ djo-e ..... Man kann die Leute nicht mehr sehen, weil es dunkel ist.
!a da ! ..... Mitternacht

Die Tageseinteilung ist nach der Jahreszeit etwas verschieden. Mit Ausnahme der sogenannten heißen Zeit, etwa 20. August bis Ende Dezember, wird mit ziemlicher Regelmäßigkeit die folgende Tagesordnung eingehalten: Ehe das Morgenrot am Himmel erscheint, wird es sehr kalt, die Leute wachen wieder auf, die Jungen schüren das Feuer auf und stellen die Reste der abendlichen Mahlzeit ans Feuer. Die Alten rücken näher ans Feuer und schlafen weiter, bis die Sonne herauskommt. Dann wird gefrühstückt, und zwar die Reste der Abendmahlzeit. Die kräftigen Männer gehen nunmehr zur Jagd. Die Frauen sitzen noch etwas herum und stillen die Kinder. Etwa um 10 Uhr rücken Frauen und Kinder sowie die Mädchen geschlossen aus zum Feldkostsuchen. Fast jedes Buschweib im gebärfähigen Alter trägt ein Kind auf dem Rücken, während ein zweites oft auf den Schultern reitet. – Die kleineren Knaben bleiben zu Hause und helfen den Alten, die etwa eine Stunde später aufbrechen, um Wasser zu holen. Die Hütten werden niemals unmittelbar beim Wasser angelegt, 1. weil man beim Wasser krank wird, 2. weil dort die Löwen hinkommen, 3. weil das Wild verscheucht würde. Die Wasserstelle selbst wird zu ganz unregelmäßigen Zeiten aufgesucht, denn dort lauert in unruhigen Zeiten der Feind und gelegentlich auch die Polizei. Die Doktoren und Doktorinnen gehen allein oder nur in Begleitung eines Schülers in den Busch, meist nicht sehr weit, um Medizin zu sammeln. Gegen 4 Uhr nachmittags kommen die Frauen zurück und beginnen zu kochen. Allmählich stellen sich nun auch die Männer mit der Jagdbeute ein. Wenn die Sonne untergeht, sitzt alles beim Feuer und ißt. Jede Familie hat ihr eigenes Feuer. Dann plaudern die einen noch, die anderen schlafen bereits, und allmählich wird es stille.

Mittags wird also nicht gegessen. In der Zeit von 11—4 Uhr ist der Lagerplatz leer, auch die Alten schlafen irgendwo im Walde. Übrigens machen auch die Jäger und die feldkostsuchenden Frauen

in den heißen Stunden eine ausgiebige Mittagsrast. In der eigentlichen heißen Zeit bricht man aber schon bald nach Mitternacht auf, um zu jagen und Feldkost zu suchen, weil später am Tage der Sand zu heiß ist, um darauf zu laufen.

6. DIE JAHRESEINTEILUNG

Die Buschmänner rechnen zwar auch nach Vollmonden, indem sie z. B. ausmachen, nach 3 oder 4 Vollmonden sich zu treffen usw., haben aber nur 10 Monate. Diese benennen sie nach terrestrischen Erscheinungen.

!Kai dsâa	Es ist kalt (Winter)	Juni
gama /ši	Das Gras brennt	Juli/August
!hoá ceri	Es ist heiß	September/Oktober
!u shê	Der Regen beginnt	November
ʃ'khô shê	Die Bäume blühen	Dezember
/hô //gâi	Es regnet	Jänner
!Khan //gai	Die Feldkost kommt heraus	Februar
!nâ'-mâ	Die Feldkost ist reif	März
ao ré //kum //ká ...	Der Regen hört auf	April
!hoá //gai	Das Jahr ist zu Ende	Mai

Sie rechnen also von Ernte zu Ernte.

Die schönste Zeit im Leben der Buschmänner sind März und April. Auch die auf den Farmen Lebenden eilen dann in die Wildnis. An bestimmten Plätzen, wo reiche Fruchtbäume, etwa die Marula stehen, kommen von weit und breit die befreundeten Sippen zusammen. Hier suchen sich die Jungen ihre Bräute aus, es wird viel getanzt, denn die Frauen sind in dieser Zeit nicht vom Feldkostsuchen müde, weil man diese nun überall findet. Die Jagd ist um diese Zeit weniger ergiebig, weil das Wild überall Wasser und Weide hat.

Aber bald fallen die Blätter, der Buschwald färbt sich rot und gelb, die Zugvögel ziehen nach Norden, und bald stellen sich die ersten kalten Nächte ein. Jetzt kommen die „Deso" (Krankheitsgeister) und machen die Brust krank. Ende Mai und anfangs Juli stellen sich die ersten Fröste ein. Jetzt ziehen die Buschleute zu den Wasserstellen, die lange offen bleiben. Die Nächte werden nun zur Qual. Es kommen häufig Verbrennungen auf der Brust- und Bauchhaut vor, weil sich die Buschleute nun enge ans Feuer schlafen legen. Um diese Zeit beginnen manche Sippen schon Mangel zu leiden, weil das Wild andere Gegenden aufsucht, wo noch etwas Weide ist. Im Juli ist endlich das Gras trocken genug, damit es angezündet werden kann. Nun brennt die ganze Steppe. Das junge Gras lockt das Wild wieder an; die Jagd wird besser. Die heiße Zeit ist die schlimmste Periode, die Standplätze des Wildes sind ganz unsicher, die Feldkost wird immer spärlicher, die Buschmänner magern jetzt zu erbärmlichen Skeletten ab. Viele laufen um diese Zeit zu den Schwarzen oder Weißen, um etwas zu verdienen. In trockenen Jahren nimmt man auf die Sippengrenzen keine Rücksicht mehr. Alle sammeln sich um die wenigen noch offenen Wasserlöcher an. Sobald der Regen anfängt, beginnen sich die Verhältnisse wieder zu bessern, man wandert auseinander, um sich erst nach Monaten zur Zeit der Feldkosternte da und dort wieder zu treffen.

7. DER LEBENSLAUF

Wie ein junger Mann ein Mädchen freit, gebe ich in wörtlicher Übersetzung meines Berichterstatters wieder:

Wenn ein junger Mann ein Mädchen heiraten will, dann muß er zuerst mit ihr sprechen und ihr sagen: „Ich habe dich lieb und will dich heiraten." Wenn das Mädchen will, dann sagt sie zuerst: „Du mußt warten." Dann geht sie zu ihren Eltern und fragt sie, ob sie schon gehört haben, daß der Junge mit ihr gesprochen habe. Dann fragen die Eltern, ob das Mädchen sich mit dem Manne verheiraten

will. Wenn das Mädchen sagt: „Ja", dann sagen die Eltern: „Er hat dich gewollt, er hat gesehen, daß du gut und fleißig bist, ihr könnt heiraten." Wenn aber der junge Mann sich die Sache überlegt und sein Wort zurücknimmt, dann geht das Mädchen nochmals zu ihren Eltern und der Junge zu den seinen. Die sagen: „Ihr habt es so gewollt, da kann man nichts machen." Falls aber das Mädchen endgültig ihre Zustimmung gibt, dann bringt der Junge allerhand kleine Geschenke und gibt sie seiner Braut, die sie ihren Eltern bringt. Die Schwiegereltern müssen nunmehr ihrerseits Geschenke machen. Mit dem Wechsel der Geschenke gilt die Ehe legaliter als geschlossen.

Die Jagdprobe, die Passarge[1] und andere beschreiben, ist nicht die Regel. Manche eitle Mädchen verlangen sie, und manchmal machen es auch die Jungen freiwillig, um Konkurrenten auszustechen. Diese Jagdprobe vollzieht sich dann folgender Art. Der Junge geht ohne Waffen auf die Jagd und hetzt ein Wild (in der Regel einen Gemsbock), bis er müde ist und treibt ihn dann in die Nähe der Hütte seiner Auserwählten. Das Hetzen einer solchen Großantilope ist nicht so schwierig, wie es aussieht. Diese Wiederkäuer werden nämlich von schweren Krämpfen befallen, wenn man ihnen nicht Zeit läßt, sich zum Wiederkauen niederzulassen. Das Hetzen einer solchen Großantilope läuft also letzten Endes auf ein langdauerndes Beunruhigen hinaus. Dann ruft er die Leute und bittet sie um Waffen. Alle springen auf und auch das Mädchen steht auf und sieht, wie ihre Leute mit den Spießen laufen. Der Jäger tötet das Wild vor ihren Augen. Dann bringen sie das Fleisch heran und kochen, das Mädchen aber sagt: „Das ist ein tapferer Jäger, den will ich heiraten." Nun kommt es aber nicht selten vor, daß ein junger Mann fernab von seinen Angehörigen heiratet, ohne daß er seine Eltern um Zustimmung gefragt hatte, dann muß die junge Frau zunächst bei ihren Eltern bleiben, der Ehemann kehrt in die Heimat zurück und meldet es seinen Eltern. Die sagen: „Wie kannst du das machen, wenn wir nicht wissen, ob es gut wird?" Der Ehemann aber sagt: „Ich habe es schon gemacht und sage es euch bloß." Da antworten die Eltern dann: „Nun, es ist gut." Da kehrt dann der Ehemann zu seiner jungen Frau bzw. deren Sippe zurück und bringt die Frau samt dem Kind zur eigenen Sippe, wo sie aufgenommen werden. Nach Vedder (Tsumeb) schickt der junge Mann dem Vater des Mädchens seiner Wahl ein Stück Wild durch einen Boten. Nimmt der Vater das Wild an, so gilt die Verlobung für geschlossen. Sobald der Junge in die Werft seines Schwiegervaters übersiedelt, gilt die Ehe für geschlossen. Er muß für diesen ein Jahr lang arbeiten und alle Jagdbeute abliefern, darf aber die Hütte seiner Schwiegereltern nicht betreten. Ist das erste Kind geboren, so zieht er mit Frau und Kind zu seiner Sippe.

v. Zastrow und Vedder[2] berichten über die Eheschließung:

„Es wird ausgiebig getanzt. Die Tiertänze haben durchgehend einen erotischen Zug. In einem der ersten Tänze tritt der Bräutigam als Bulle irgendeiner Tierart auf, die beiden Sippen besonders schätzenswert erschienen ist. Er befindet sich in der Reihe der tanzenden Männer. Ihnen gegenüber haben in langer Reihe die Frauen Aufstellung genommen, die den Tanz mit Stampfen, Singen und Klatschen in die Hände begleiten. Unter ihnen steht die Braut. Sie ist durch nichts von den anderen Frauen und Mädchen ausgezeichnet. Nach einigen Wendungen tritt der Bräutigam aus der Reihe der Männer hervor, geht tanzend auf die Braut zu, erfaßt sie und geht tanzend wieder zurück. Daraufhin geht aus der Reihe der Frauen die Braut händeklatschend, stampfend und singend auf den Bräutigam zu, ohne ihn zu berühren, wendet sich zurück, indem ihr Gesicht dem Bräutigam zugewandt bleibt, und tritt wieder in die Reihe der Tänzerinnen ein. Damit ist die äußere Formalität der Eheschließung vor vielen Zeugen zum Abschluß gekommen.

Es ist aber die Pflicht des jungen Mannes, ein Jahr lang die väterliche Sippe zu verlassen und für seine Schwiegereltern zu arbeiten. Das bedeutet für ihn, daß er jede Jagdbeute, deren er habhaft wird, hinter der Hütte seiner Schwiegermutter niederlegt. Natürlich erhält auch er bei der Fleischverteilung sein Stück. Aber er gilt noch nicht als eigentlicher Versorger seiner jungen Frau, die nach wie vor ihren Fleischanteil an der Jagdbeute von der Schwiegermutter erhält, daneben aber für sich und für ihren Mann Feldkost sucht.

Der Mann als Jäger ißt nur das Fleisch des Rumpfes. Den Frauen und Kindern aber stehen die Beine und Eingeweide zu. Gewisse Teile läßt man von den Kindern nicht essen; so z. B. darf ein Kind das Herz eines Schakals nicht essen. Das Kind würde dadurch zwar nicht krank werden. Da aber der Schakal sehr furchtsam ist, würde das Kind in einem solchen Fall auch furchtsam werden.

[1] Passarge, Die Buschmänner der Kalahari. 1907.

[2] v. Zastrow und Vedder, Die Buschmänner, l. c. S. 417 in Schultze-Ewerth: Das Eingeborenenrecht Bd. II.

Nachdem das erste Jahr der Ehe mit seiner Dienstpflicht um ist, folgt die junge Frau ihrem Manne zur Werft, wo der Vater oder die Sippe des Mannes wohnt.

Ist das Kind so schwächlich, daß es wahrscheinlich nicht aufgezogen werden kann, oder hat es einen körperlichen Fehler, so wird es am gleichen Tage mit oder ohne Einwilligung des Vaters und der Mutter lebendig begraben.

Der Name des Kindes wird vom Vater gegeben. Dies geschieht wenige Tage nach der Geburt. Der Vater speit auf die Brust des Kindes und ruft es dabei an. Andere benetzen es mit Wasser aus einer Quelle. Der Gebrauch des Speichels ist ohne Zweifel ursprünglich, nicht etwa Ersatz für Quellwasser."

Dem neugeborenen Kinde gibt der Vater einen Namen. Die Jungen bekommen meist Tiernamen, häufig den des Großvaters, die Mädchen Pflanzennamen. Albinos sind bei den von mir besuchten !Kungstämmen unbekannt, doch soll eine Horde von Buschmännern mit roten Augen im östlichen Sandfelde in der Gegend des Dussidum leben. Zwillinge habe ich nicht gesehen, sie werden wohl beseitigt. Die Kinder werden lange gestillt, ältere Säuglinge lernen mit den Fingern die Milch aus der Brust herausdrücken oder ziehen mit den Zähnen an den lederharten Warzen. Die Behauptung anderer Reisender, daß die Buschweiber ihre Kinder töten, wenn sie zur Welt kommen, ehe das frühere abgestillt ist, trifft für die von mir besuchten Sippen angeblich nicht zu. Dagegen berichtet Vedder[1]:

„Noch eines anderen Brauches muß ich Erwähnung tun, der ebenfalls sehr dazu beiträgt und in vorgeschichtlicher Zeit dazu beigetragen haben mag, daß die Buschmänner so wenig zahlreich sind. Die Sitte gebietet, daß ein Kind, das geboren wird, während das ältere Kind derselben Mutter noch nicht dreijährig ist, lebendig begraben wird. Das ist eine grausame Sitte. Ich sprach darüber mit einem reinrassigen Buschmann. Meine Vorhaltungen leuchteten ihm nicht im geringsten ein. Er führte aus: ‚Wir Buschmänner sind arme Leute. Wir haben keine Ziegen und haben keine Kühe, um unseren Kindern Milch geben zu können. Wenn nun das Weib innerhalb eines Zeitraumes von drei Jahren zwei Kinder zur Welt bringt, so wissen wir nicht, wovon das ältere Kind leben soll, wenn das neugeborene Kind die Muttermilch verbraucht. Von der harten Feldkost kann es nicht leben und vom zähen Fleisch auch nicht. Die Zähne sind noch nicht stark genug. Ließen wir das neugeborene Kind am Leben, so müßte das ältere Kind zugrunde gehen. Uns bleibt nur die Wahl, eines der Kinder zu töten, damit eins am Leben bleiben kann.' Die Darlegung leuchtet ohne weiteres ein. Dazu kommt, daß die Buschmannmütter ihre mütterlichen Triebe verlieren, wenn sie sehen, daß ein Kind nicht gedeiht. Ich sah ein halbjähriges Buschmannkind, eine wahre Jammergestalt. Die Mutter hatte für ihr Kind nicht genügend Nahrung. Meine Frau erbot sich, dem Kinde die Flasche zu geben. Der Vorschlag wurde mit Freuden aufgenommen. Einige Tage wurde das Kind zur festgesetzten Zeit gebracht. Es nahm die Flasche gern. Dann aber fühlte sich die Mutter in ihrer Freiheit beschränkt. Sie mußte ja um des Kindes willen in der Nähe des Hauses bleiben. An Nahrung fehlte es ihr in keiner Weise. Ich sorgte für sie. Aber das Verlangen nach Feldkost war zu groß. So wurde das Kind nur morgens und abends gebracht und erhielt seine Mahlzeit. Eine in die Augen fallende Besserung ließ sich natürlich nicht wahrnehmen. Bei einer günstigen Gelegenheit verschwand daher die Mutter, und als sie wieder erschien, war sie ohne Kind. Sie hatte es mit ihren Freundinnen lebendig begraben."

So hoffnungslos, wie Vedder die Dinge hier darstellt, sind sie nun gewiß nicht immer, denn erstens bekommen die Kinder schon in sehr frühem Alter vorgekauten Feldkostbrei und dann helfen sich auch die Frauen der Sippe beim Stillen gegenseitig aus. Der Säugling hält sich tagsüber im Rückenfell der Mutter auf, nachts schlafen die Kindlein an der Brust der Mutter, und zwar liegt das Kleinste unmittelbar an der Brust, während sich die anderen in der kalten Zeit um die Beine der Mutter lagern. Die Kinder werden von frühester Jugend an belehrt, die Alten zu ehren und niemandem etwas zu nehmen. Den Jungen schnitzt der Vater bald Bogen und Pfeil, den Mädchen einen kleinen Grabstock. Den kleinen Kindern sagt man nichts, wenn sie Dinge nehmen, die ihnen nicht gehören, erhält aber der Junge einmal einen Bogen, dann darf er Bogen und Pfeile von niemand anderem mehr berühren, sonst setzt es Prügel. Die Jungen haben eine große Angst vor den Frauen. Die größeren Jungen halten sich dann in Gesellschaft beisammen und machen auf Kleinwild Jagd oder sie begleiten die Erwachsenen bei der Großwildjagd.

Die Ehe ist absolut untrennbar. Es ist auch eine Trennung gar nicht möglich, denn außerhalb des Sippenverbandes würde die Frau in der Wildnis zugrunde gehen. Soweit ich gesehen habe, ist das Verhältnis zwischen den Ehegatten im allgemeinen sehr gut, und die Männer sind nicht selten stark unter dem Einfluß ihrer Frauen. Es kommt so gut wie nie vor, daß ein Mann seine Frau schlägt. Monogamie

[1] Zur Vorgeschichte der eingeborenen Völkerschaften von Südwestafrika. I. Die Buschmänner von V. Vedder, aus: Journal of the South West Africa Scientific Society, Vol. I, p. 10, 1925—1926, Windhuk 1927. — Vgl. auch v. Zastrow und H. Vedder, l. c., S. 414.

ist die Regel. Ich kenne einen einzigen Fall, wo ein Mann zwei Schwestern zu Frauen hatte. Freilich zwingen bestimmte Ehegesetze oft die Männer, bedeutend ältere Mädchen zu heiraten. Es ist daher begreiflich, daß dann oft der Wunsch nach einer jüngeren Lebensgefährtin entsteht. Dazu ist jedoch die Zustimmung der ersten Frau unbedingt notwendig. Darum sagt man auch: „Wer eine gute Frau hat, kann mehrere Frauen haben, wer eine böse hat, muß mit ihr allein zufrieden sein." Die Buschmänner kennen keine Vorbeugungsmittel gegen Schwangerschaft und sehr bald nach der Ehe befindet sich auch die junge Frau schon in anderen Umständen. Der Ehemann und die Schwägerinnen müssen darauf sehen, daß sie keine sauren Feldfrüchte, nichts Süßes und auch kein fettes Fleisch ißt. Niemand darf hinter dem Rücken der Schwangeren vorbeigehen, beim Feuer soll kein Topf aufgestellt werden, bevor die Frau mit dem Ruß des Töpfes eingerieben ist; sie soll nicht herumsitzen, wo die anderen Leute sind, sondern sich abseits halten. Wenn die Geburt herannaht, dann muß sie über die Beine ihres Ehemannes steigen, der sich in Einschnitte der Waden Medizin eingerieben hat. Fühlt die Frau, daß die Wehen beginnen, dann geht sie allein in den Busch und sucht Feldkost. Sie soll sich dann nicht niedersetzen, weil das schädlich für die Geburt wäre. Dann rupft sie Gras aus, macht sich unter einem Baum ein Lager, legt ihre Feldkosttasche beiseite und gebärt das Kind, während sie sich in hockender Stellung befindet und sich mit den Händen an einen Ast anklammert. Dann nimmt sie das Kind, nabelt es selbst ab, packt es in ihren Feldkostbeutel und geht damit nach Hause. Die Abnabelung wird immer mit einem Quarzmesser vorgenommen (wie bei den Dama). Die Nabelschnur (!nú) wird vergraben. So handeln aber nur Frauen, die keine Angst haben und die schon ein Kind geboren haben. Die Erstgebärenden, welche Angst haben, gehen aber nicht aufs Feld hinaus, sondern bleiben zu Hause. Sobald die Wehen beginnen, weinen sie und gehen heraus, setzen sich nieder und stehen wieder auf. Ältere Frauen aus der Sippe begleiten sie und schließlich wird in deren Anwesenheit das Kind innerhalb der Hütte geboren. Die Männer dürfen nicht dabei sein. Auch die Kinder dürfen nicht zusehen, und wenn sie sich neugierig heranschleichen, werden sie verprügelt. Treten Schwierigkeiten ein, so massiert man den Unterleib. v. Zastrow und Vedder[1] berichten weiter:

„Es ist aber durchaus gegen die Ordnung, der Schwangeren durch Worte oder Handlungen etwas zuzufügen, das sie böse machen könnte. Ihr böser Blick ist in dieser Zeit besonders gefährlich; ihr böses Wort oder gar ihr Fluch wirkt noch schlimmer. Geschwüre, Krankheit, Siechtum, Tod sind die Folgen des bösen Blickes oder des Fluches einer Schwangeren.

Es ist Brauch, erst dann mit einem Instrument die Nabelschnur abzuschneiden, wenn das Blut nicht mehr pulsiert. Der Nabel wird nicht abgebunden. Die Nachgeburt muß sorgfältig und heimlich vergraben werden. Das Leben des Kindes käme in große Gefahr, wenn ein Tier sie fände, oder wenn gar ein gefürchteter Zauberer sich Stückchen davon aneignen könnte."

Sobald die Mädchen die erste Menstruation (/n)[2] bekommen, findet eine Festlichkeit statt, über deren Details ich bei diesem Stamm nichts erfahren konnte. Dabei tanzen die Frauen, klatschen in die Hände und singen: „giriri, giriri, giriri, uhu, giriri uhu usw."

Männer dürfen bei diesem Fest nicht anwesend sein. Bei einer den !Kung benachbarten Hei//om-Horde werden bei diesem Feste nach allen Richtungen Geister angerufen, damit das Mädchen, wenn es erwachsen ist, überall Feldkost findet.

Das Vorhandensein einer eigenen Jünglingsweihe wird geleugnet[3]. Es findet lediglich eine Art Prüfung statt, ein älterer Mann geht mit dem oder den Kandidaten auf die Jagd. Der Kandidat muß ein Stück Großwild unter Aufsicht der Alten zur Strecke bringen. Dieses geschossene Wild wird dann zum heiligen Feuer, an welchem die Alten sitzen, gebracht. Der junge Mann darf davon nichts essen, nur die Suppe darf er trinken. Mit dieser wird er auch eingerieben. Von jetzt an gilt er als Erwachsener, heiratsfähiger Mann, seine Eltern fragen ihn, ob er nicht schon heiraten will. Oft sagt der Junge aber: „Ich bin noch schwach und weiß nicht, ob ich sie gut pflegen kann." Dann lassen ihn die Eltern so lange warten, bis er selbst heiraten will. v. Zastrow und Vedder (S. 415) berichten über die Jugendweihe:

[1] v. Zastrow und Vedder, Die Buschmänner. S. 412, 413.

[2] Weibliches Genitale (/n-i).

[3] In diesem Punkte wurde ich entweder nicht verstanden oder angelogen.

„Hier wird dem Burschen gesagt, in welcher Weise sie sich zu verhalten haben, wenn er sie ausgehen, um eine Frau zu suchen. Wie sie sich einer Schwiegermutter gegenüber betragen müssen. Sich am Abend nur neben ein erwachsenes Mädchen zu setzen, ist gleichbedeutend mit einem Heiratsantrag, auch wenn kein Wort gesprochen wird. Eine Schwiegermutter darf unter keinen Umständen angesehen werden. Im Busch werden auch Tiertänze eingeübt, wie sie später bei fröhlichen Festen, aber auch in Zeiten der Not von den Männern aufgeführt werden. Hier erhält endlich der junge Buschmann das Stammeszeichen, das in einigen Hauteinschnitten auf der Wange unterhalb der Schläfe besteht. Jeder Stamm hat eine bestimmte Anzahl von Hauteinschnitten. Um diese nach der Verheilung noch deutlich hervortreten zu lassen, wird in die Einschnitte pulverisierte Kohle gestreut. Dadurch erscheint später das Stammeszeichen als schwarzer Strich auf der gelben Haut.

Nichts liegt im Wege, bei dieser Feier dem angehenden Jäger noch ein anderes Zeichen beizubringen, nämlich die Jagdimpfe. Es muß dies aber ein Mann tun, der über besondere Kräfte und Kenntnisse verfügt. Um nämlich das Auge des angehenden Jägers für das Wild überhaupt und für bestimmtes Wild insonderheit zu schärfen, ist es nötig, daß ihm zwischen den Augen über der Nasenwurzel ein tiefer Einschnitt gemacht wird, in den die kundige Hand des Operateurs ein Pulver streut, das aus getrocknesten und pulverisierten Körperteilen von allerlei Wild besteht.

Die Impfung kann später öfter wiederholt werden, wenn der Jäger kein Jagdglück hat.

Wer das Stammeszeichen erhalten hat, gilt nunmehr als Busch,mann', kann sich Bogen und Pfeile anfertigen, wie die Alten besitzen, und mit ihnen zur Jagd gehen. Es steht ihm auch der Weg zur Gründung einer Familie offen."

Es kommt so gut wie niemals vor, daß ein Buschmann unverheiratet bleibt. Die Eheschließung findet schon in noch jungen Jahren statt. Das Alter, welches die Buschmänner erreichen, ist nicht hoch. Es gibt relativ wenig alte Leute unter ihnen. Manche von ihnen erreichen allerdings ein sehr hohes Alter. Die Kinder müssen auch, wenn sie schon erwachsen und verheiratet sind, den Eltern gehorchen.

Die Buschmänner stellten mit Entrüstung in Abrede, daß sie die Alten töten oder im Busch aussetzen; wenn jemand alt, schwach oder krank ist, dann wandert man eben langsamer oder läßt den Kranken unter Begleitung zurück. Meine Gewährsmänner berichteten mir wohl, daß es in schweren Durstzeiten vorgekommen sei, daß man nicht nur Alte, sondern auch Frauen und Kinder, die nicht weiterkonnten, zurückließ. Aber das geschah nur in der Verzweiflung, weil man den Halbverdursteten ohnehin nicht helfen konnte und ein Aufenthalt den Untergang der ganzen Sippe herbeigeführt hätte. Sobald jemand gestorben ist, kommen alle Frauen und Mädchen zusammen, setzen sich um die Leiche und weinen. Gesungen wird nicht dabei. Dann gehen einige Männer und werfen im Busch ein Grab aus, kappen sodann mittelgroße Hölzer ab und legen diese als Unterlage auf den Boden des Grabes. Darauf wird dann das Heu ausgebreitet, auf welchem der Verstorbene zuletzt gelegen hat. Sodann bringen alle die Leiche zu Grabe und bestatten dieselbe als liegenden Hocker mit dem Rücken gegen Sonnenaufgang. Jeder Verwandte muß etwas Glasperlen und Schmuck hergeben, wenn der Verstorbene eine Frau ist. Dieser Schmuck wird der Toten um den Hals gelegt. Die Leiche wird mit grünem Parfümpulver und Ocker eingerieben und in ihre Felle und Decken eingehüllt. Auf das geschlossene Grab werden entweder Dornbüsche geworfen oder es wird im Sande eine viereckige Rinne rund um das Grab gezogen, und in die Rinne werden Pfähle eingerammt, so daß ein Zaun entsteht. Das Grab liegt jetzt in der Mitte der Umzäunung wie der Lebende in der Mitte seiner Hütte. In der Gegend des Kopfes wird ein Topf mit Wasser und etwas Nahrung hingestellt. Verstorbenen Männern werden Bogen, Pfeile und ihre Jagdtasche auf die Brust gelegt. Kindern gibt man ihren Miniaturbogen mit. Die Buschmänner sagen, daß sie Bogen und Pfeil nicht deswegen ins Grab mitgeben, weil der Verstorbene sie im Jenseits zur Jagd braucht, sondern weil man die Sachen des Verstorbenen, den man geliebt hat, nicht weiter verwenden will. Nach Vedder[1] werden die Toten der Buschmänner in Hockerstellung zusammengebunden und unter Termitenhügeln bestattet.

„Die Leiche wird gewöhnlich so hinabgelassen, daß sie von einem im Grabe stehenden Manne empfangen wird. Außer denen, die die Leiche bringen und das Grab graben, geht niemand mit zur Beerdigung. Die Leiche wird entweder in Hockerstellung oder in Hockerlage beerdigt. Bei der Hockerstellung wird das Gesicht nach Osten gerichtet und die Ellenbogen ruhen auf den Knien, während sich die Hände an beiden Seiten des Kopfes befinden. Bei der Hockerlage wird die Leiche auf die linke Seite gelegt. Die linke Hand liegt, wie bei einem Schlafenden, unter dem Kopfe. Das Gesicht sieht ebenfalls nach Osten.

[1] v. Zastrow und Vedder, Die Buschleute, S. 420, 421.

Geftrchtete Männer, nicht Frauen, etwa Zauberer, die einen verderblichen Einfluß hatten, und andere, die man im Leben fürchten mußte, werden vor der Beerdigung in der angegebenen Hockerstellung mit Riemen aus Wildfell fest zusammengeschnürt, sodann wird ihnen in manchen Fällen noch das Rückgrat mit einem Stein oder Beil zerschlagen, wodurch der Kopf sich noch tiefer neigen und zwischen die Knie bringen läßt. So zusammengeschnürt werden sie in eine Erdspalte, in das Loch eines Erdferkelweines, in eine kleine Höhle geworfen."

8. DIE JAGD

Es ist bekannt, daß dort, wo die Buschmänner mehr oder weniger ungestört sind, jede Sippe ihr genau umgrenztes Jagdgebiet hat. Vedder glaubt, daß die Gravierungen von Wildspuren alte Grenzen anzeigen und desgleichen auch die Steinhügel, die gewöhnlich als Heisebgräber bezeichnet werden. Wie dem auch sei, es erhebt sich die Frage, wer denn eigentlich diese Grenzen festgesetzt hat. Meine Gewährsleute sagten einstimmig, die Einteilung stamme noch aus der Zeit, wo die Buschmänner noch einen Oberkapitän hatten. Es scheint aber auch jetzt noch irgendeine Instanz zu geben, denn im Buschfeld sind ja die Grenzlinien nach bestimmten Bäumen gezogen, die ja im allgemeinen keine allzu lange Lebensdauer besitzen. Innerhalb ihres Jagdrevieres ziehen die Buschmänner hin und her. Nun kommt es vor, daß ein junger Jäger die Grenzen nicht genau kennt, oder daß das angeschossene Wild die Grenze überschreitet. In diesem Falle muß der Jäger zu der Sippe gehen, der dieses Gebiet gehört und kehrt dann mit Männern derselben zu der Jagdbeute zurück. Dann wird das Tier sorgfältig in der Medianlinie geteilt, der Jäger erhält die Hälfte und die Hälfte die Eigentümer. Trotzdem gibt es oft Streit, weil manche Organe, wie etwa das Herz, die Leber usw. nur einmal vorhanden sind. Diese Verhältnisse bestehen allerdings nur innerhalb der Gruppe der Ost-!Kung. Ein Hei//om oder ein Nord-!Kung, der in fremdem Stammesgebiet auf der Jagd angetroffen wird, wird als Feind angesehen. Die Jagd der Knaben beschränkt sich auf Eidechsen, Baumratten und andere Nager. Benutzt wird gewöhnlich der Vogelpfeil, welcher aus einem Stück Holz geschnitzt ist, doch haben im Gegensatz zu den Owambo hier schon die älteren Knaben Giftpfeile. Jung und alt obliegt mit Eifer der Vogeljagd; insbesondere der Jagd auf Perlhühner, Sandhühner, Rakelhühner und dem Pau, soweit dieser in dem Gebiete vorkommt. Diese Hühner und kleine Buschböckchen sind die Hauptfleischnahrung der Eingeborenen. Das Waldgebiet der Ost-!Kung ist arm an Großwild. Zebras fehlen so gut wie ganz, ebenso Wildebeester; die Giraffe ist sehr selten. Relativ häufiger sind das Eland, Kudu, Hartebeest und besonders der Gemsbock. Treibjagden werden veranstaltet, um Elefanten oder Nashörner zu jagen. Zunächst wird der Elefant von der Herde abgetrieben. Sobald man ihn in der Enge hat, springt ein Buschmann nach dem anderen vor und wirft den Speer. Man kann jedoch auch mit dem Giftpfeil den Elefanten jagen; seine Haut hat an den Vorderbeinen einige dünnere Stellen, und dort plaziert der Schütze soviel Pfeile als möglich. Der Elefant stirbt nicht, er wird bloß krank. Der Jäger eilt nach Hause und holt andere Männer, die dann mit den Speeren den Elefanten suchen gehen. Fallgruben mit einem spitzen Pflock darin werden in der Nähe der Wasserstellen gemacht. Mit Fallgruben jagen die Buschmänner am Okawango auch das Flußpferd. Die Ost-!Kung behaupten, daß in uralter Zeit auch in ihrem Lande Flußpferde vorgekommen seien. Die Schlingenfalle wird in verschiedenen Größen gemacht. Speziell der Strauß wird gewöhnlich in solchen Schlingenfallen gefangen, die man mit einem Stück von der Sonne gebleichter Knochen beschickt. Auch kleine Katzen u. dgl. werden mit der Falle gefangen. Auf die Wechsel der Buschböcke stellt man sie ebenfalls. Schakale u. dgl. fängt man, indem man ihnen beim Herauskommen aus ihrem Bau auflauert und sie dann mit dem Kirri erschlägt.

Termiten werden auf zweierlei Weise erbeutet. Bei den hohen Termitenhügeln werden nächtlicherweile Löcher gegraben, und diese Löcher werden mit Holzfackeln beleuchtet. Man legt auf den Boden des Loches ein Fell, und bald sind so viele Termiten darauf, daß man das Fell nach Hause tragen kann. Die zweite Methode wird beim Fang jener Termiten benützt, die keine oberirdischen Bauten haben, sondern unmittelbar unter der Oberfläche ein Netz horizontal verlaufender Gänge. Man macht dann ein Loch, das tiefer ist als die Gänge, und die Termiten fallen dann, wenn sie erschreckt auf ihren

horizontalen Wegen hin und her laufen, hinein. Diese Sorte von Termiten dient den Regendoktoren auch als Wetterprophet. Ist ein Regenjahr in Aussicht, so bauen sie die meisten nach oben gelegenen Öffnungen zu. Der Löwe wurde nicht gejagt. In alten Zeiten haben nur die alten Leute das Großwild gegessen. Raubtierfleisch ist allen Kindern verboten, dagegen besteht kein Verbot, den Hasen zu essen.

Natürlich sind die Buschmänner sehr darauf bedacht, sich des Jagdglückes zu versichern. Das Jagdglück bringt !Khu, der große Kapitän, selbst. Er befiehlt dem obersten //Gauab (/Nawa), den Pfeil zu lenken. Die Doktoren bitten immer den großen Kapitän, er möge Jagdglück schicken, aber sie haben hierfür keine bestimmte Formel. Sie tun das „still für sich". Ein alter Prospektor erzählte mir in Kalkfeld, er habe bei den !Kungbuschleuten folgendes gesehen: „Bevor sie auf die Jagd gehen, zeichnen sie den Umriß des Tieres in den Sand und unter allerhand Zeremonien schießen sie einen Pfeil auf die Zeichnung. Dort, wo die Figur getroffen wurde, wird auch das Wild getroffen werden."

Den Verlauf einer Kudujagd, wie sie mir ein Buschmann beschrieb, gebe ich nun nach seinen Angaben ziemlich wörtlich wieder: „Wenn ich eine Kuduspur gefunden habe, dann gehen wir ganz still auf ihr, und wenn wir den Platz gefunden haben, wo das Kudu gesessen hat, dann muß man ganz vorsichtig sein. Einer geht voran und die anderen folgen. Wenn ich nun das Kudu stehen sehe, dann nehme ich den Giftpfeil heraus und schieße. Dann sehe ich weiter, was das Kudu macht oder schieße noch einmal, dann folge ich ihm, um zu sehen, ob der Pfeil herausfällt; ist der Pfeil herausgefallen, dann nehme ich ihn und sehe, wie tief er in das Kudu eingedrungen ist. Dann muß ich zurückgehen zu den anderen Jägern und genau sagen, wie alles war. Dann gehen wir nach Hause. Man darf dem Kudu nicht nachlaufen, sondern muß es allein lassen. Der geschossen hat, muß gleich nach Hause gehen und darf nicht reden, nicht essen und nicht trinken, denn wenn der Schütze mit anderen spricht, wird man das Kudu lange nicht finden, und wenn er Wasser trinkt, wird das Gift wäßrig und kann nicht wirken, und wenn er ißt, wird das Kudu sitzenbleiben und das Gift wird nicht gut wirken. Am anderen Morgen ganz zeitig früh müssen wir auf die Spur gehen. Das Kudu ist schon tot. Die Leute tragen das Fleisch nach Hause. Dann wird es zum Sochafeuer gelegt. Man muß dem //Gauab etwas von dem Fleische geben. Wer das nicht tut, den wird der //Gauab mit schwerer Krankheit strafen, und die Leute werden sagen: „Das ist recht, der //Gauab hat ihm das Wild geschenkt, warum gibt er selbst nichts für //Gauab." Hier handelt es sich also um ein richtiges Primitialopfer.

Interessant ist die Erkundung, daß die Ogowe an verschiedenen Wasserstellen Pfeile mit der vergifteten Spitze nach oben an schattigen Plätzen, die vom Wilde mit Vorliebe als Lagerstellen benützt werden, in den Sand graben und durch bestimmte Zeichen, wie Verknotung der Halme hochstehender Gräser usw. Warnungszeichen aufstellen (v. Zastrow und Vedder).

Wenn eine Buschmannhorde heute im Jahre ein halbes Dutzend Großantilopen erjagen kann, darf sie vom Glück reden.

Häufig wird auch das Stachelschwein gejagt, das Schuppentier und gelegentlich das sehr häufige, aber schwer zu erlangende fette Erdferkel. Affen sind sehr selten; dagegen bilden Baumratten eine gern gewünschte Zugabe zur Nahrung. Der Strauß ist im offenen Gelände nicht selten, und Straußeneier werden sehr gesucht. Gelegentlich mag noch eine Riesenschlange, die wie ein fetter Fisch schmeckt, oder ein Leguan den Küchenzettel ergänzen.

Unter den Tieren, welche dem Menschen in irgendeiner Art gefährlich werden, sind besonders die Löwen zu nennen, die in großer Zahl vorkommen, aber sich selten an einem Platze lange aufhalten. Ihnen fallen besonders im Norden eine ganze Anzahl Buschmänner zum Opfer. Löwen, Leoparden, Hyänen und Schakale werden nicht gejagt und nicht gegessen, ebensowenig Raubvögel. Der Genuß des Leopardenfleisches ruft Fieber und Ekzeme hervor, während der des Raubvogelfleisches vorübergehende Erblindung und Krankheitssymptome erzeugt, die denen einer akuten Wurstvergiftung ähnlich sind.

Giftschlangen werden nicht gegessen; sie sind auch viel seltener als in den steinigen Gebieten der Mitte und des Südens und bilden keine nennenswerte Gefahr.

Unter den gefährlichen Insekten steht natürlich die Anopheles an erster Stelle, die während der

9

Regenzeit in ungeheuren Mengen vorkommt. An manchen Stellen sind kleine rothraune Zecken häufig. Die Glossina scheint zu fehlen; ich habe dahingehörige Tiere nur in den Kunenesümpfen angetroffen. Unter den menschlichen Parasiten sind Wanzen und Flöhe so gut wie unbekannt, dagegen Läuse außerordentlich häufig, ohne daß sie von ihren Besitzern besonders beachtet werden.

9. DIE WASSERVERSORGUNG

Die Wasserversorgung spielt während der trockenen Zeit eine entscheidende Rolle. Jeder Buschmann trägt in seinem Köcher die beiden Rohre aus Gras für den sogenannten Buschmannbrunnen mit sich. Es ist nun aber keineswegs richtig, daß die Buschmänner immer und überall auf diese Weise Wasser gewinnen können. Nur an solchen Stellen, wo noch etwas Feuchtigkeit sichtbar ist, wird die Erde mit dem Grabstock aufgelockert und dann das Rohr, welches durch ein Ineinanderstecken der Teile doch über einen Meter lang wird, in der Erde versenkt. Wie die nebenstehende Figur zeigt, arbeitet der Buschmann dabei nicht so, daß er das Abflußrohr und das Saugrohr gleichzeitig im Mund hält. Die dahingehenden Darstellungen dürften überhaupt falsch sein, vielmehr hat der Buschmann das Saugrohr im rechten Mundwinkel, und sobald er den Mund voll Wasser hat, läßt er das Wasser in die geschlossene linke Hohlhand fließen, und in dieser steckt das Abflußrohr. Das so gewonnene Wasser ist natürlich vollkommen mit Speichel verunreinigt. Es kann nicht längere Zeit aufbewahrt werden.

Fig. 1. IKung beim Buschmannbrunnen.

Wasserreservoirs sind auch die wenigen Affenbrotbäume, die in ihrem Innern Wasserpfützen enthalten. Eine kunstvolle Methode wird im Sandfeld angewendet. Eine Palme wird in der mittleren Höhe des Stammes angebohrt, dann das Palmmark, soweit es geht, herausgekratzt und die Öffnung dann sorgfältig verstopft. Das aus der Wurzel aufsteigende Wasser sammelt sich in dieser Höhle und hat einen guten Geschmack.

Unter den durststillenden Wurzeln wurde mir besonders die einer Liane (Igóa) genannt.

Über andere wasserhaltige Bäume berichtet F. Seiner:

„Die wasserhaltigen Bäume sind stets zwei- oder mehrstämmig, und der Sitz des Wassers ist oben an der Gabelungsstelle zu suchen. Zeigt der Sattel, den die Äste an ihrer Vereinigungsstelle bilden, ein Loch, so ist im angrenzenden Stammteile ein Hohlraum herausgewittert, der unter Umständen bis 60 Liter Wasser fassen kann. Man gewinnt das Wasser, indem man nach Buschmannart ein kleines Bündel trockenen Grases oder noch besser ein Taschentuch an die Spitze eines Stockes bindet und diesen in die Höhlung einführt. Zieht man ihn wieder heraus, so träufelt das Wasser vom vollgesogenen Bündel oder Tuch, das über einen Becher herausgepreßt wird.

Fig. 2. //Gaub treibt das Wild den Jägern zu (aus Kühn und Obermann: „Buschmannkunst").

Die wichtigsten Wasserwurzeln sind die Asclepiadacee Fockea damarana Schltr. (Khoe) sowie die Loganiacee Dalichos Solanei Harms (Kona) und die Convolvulacee Ipomoea Solanei Pilger (Kaws); die riesigen Knollen der beiden letzteren können bis 150 kg schwer werden. Ungleich wichtiger als diese ‚Wasserwurzeln' ist für die Eingeborenen die Cucurbitacee Citrullus naudinianus Hook. (Orura der Herero, Gab der Hottentotten), ohne deren massenhaft vorkommende, größtenteils genießbare, saftreiche Kürbisse in der Trockenzeit der größte Teil der Mittel-Kalahari selbst für die Buschleute unpassierbar wäre."

Ferner F. Galton[1]:

„In der Praxis ist, wenn man sich nach Wasser umsieht, das erste Zeichen, welches Hoffnung gibt, ein Flug Perlhühner, dann, der Weise des Landes folgend, wird jeder Baum sorgfältig geprüft, bis man einen Papagei sieht, was, weil der Vogel gern auf den allerobersten Zweigen sitzt, ein sogar in großer Entfernung sichtbarer Gegenstand ist. Ein Papagei ist selten weiter als eine halbe Stunde vom Wasser entfernt, und Paviane sind es auch nicht. Wenn man mit scharfer Beobachtung fortfährt und eine wahrscheinliche Richtung nimmt, sieht man Tauben herumfliegen, dann werden kleine Vögel in allen Gebüschen gefunden, und sie sind dicht dabei."

10. DIE FELDKOST

Wie der //Gaunab den Jäger auf seiner Jagd begleitet, so ist er auch der Gefährte der Frauen, die Feldkost suchen gehen. Wenn der //Gaunab an einer Frau Freude hat, dann bricht er einem Wild die Knochen, daß es umkommt, und führt die Frau zu dem Platze hin, wo es liegt. Ist aber der //Gaunab einer Frau ungnädig, so daß sie keine Feldkost findet, dann wird die Frau böse, steht zeitig in der Früh auf, beschimpft den //Gaunab, dann nimmt sie Medizin und wäscht sich das Gesicht, damit sie der //Gaunab nicht wiedererkennt. Dann geht sie ins Feld und findet etwas. Opfer bekommt der //Gaunab von der Feldkost keine. Das Fest der ersten Feldfrüchte, das Vedder beschreibt, ist nicht mehr im Gebrauch. Von jeder Feldkostsorte, die zum erstenmal im Jahre nach Hause gebracht wird, bringt man der ältesten Frau, und sie muß es essen. Dann kostet die zweite Alte und so der Reihe nach. Wenn alle alten Frauen probiert haben, dann erst bekommen auch die Kinder davon, und die Feldkost wird sozusagen zum allgemeinen Gebrauch freigegeben. Wenn eine Frau eine Stelle gefunden hat, wo sehr viel Feldkost ist, dann macht sie an der Stelle ein Zeichen, und dann gehört alles, was dort noch wächst, ihr. Und niemand anderes nimmt davon.

Es gab und gibt auch eine ganze Menge von Socha-Feldkostsorten, die für die Alten reserviert sind.

Fig. 3. Feuerhölzer der Kalahari-Buschmänner (Völkerkundemuseum Zürich).

11. ERGOLOGIE

DAS FEUER

Die Buschmänner glauben, daß es eine Zeit gegeben hat, wo sie noch kein Feuer hatten. Wie sie zum Feuer kamen, berichtet die folgende Sage: „Der Strauß hatte einen Feuerbrand unter seinem Flügel. Er, die Eule und Heiseb spielten miteinander. Da bekam der Strauß vor der Eule Angst, weil er glaubte, sie habe Hörner. Er riet allen, sie möchten ein bißchen schlafen. Als die Eule schlief, blies er sie an und sah, daß sie bloß Federbüschel und keine Hörner am Kopfe hatte. Da weckte er die beiden andern wieder auf und lud sie ein, weiterzuspielen. Da sagte Heiseb: ‚Lieber Strauß, winke doch mit deinem Flügel.' Dieser tat es, und dabei fiel ihm der Feuerbrand zu Boden. Den packte Heiseb und warf ihn zum Feigenbaum, seit demhat der Mensch das Feuer." – Die Erzählung stammt wohl aus dem Sagenkreis der Hei//om-Hottentotten. Heiseb kommt sonst niemals in !Kunggeschichten vor. Jetzt verwendet man zur Feuererzeugung noch gelegentlich die beiden Feuerhölzer aus Feigenholz. Am meisten beliebt sind Feuerzeuge mit Schlagring und Feuerstein, Zündhölzer werden weniger

[1] F. Galton, Tropisches Südafrika, S. 101.

geschätzt. Ein paar Feuerhölzer machen neben den Saugrohren, einigen Giftpfeilen und einem Vogelpfeil das ständige Inventar des Köchers aus.

BEHAUSUNGEN

Die Behausung des Buschmannes bildet der einfache Windschirm von halbkreisförmigem Umriß und etwa 150 cm Höhe. Auf manchen Farmen allerdings sind auch die Buschmänner bereits dazu übergegangen, Bienenkorbhütten nach Hererosart zu bauen. In der Siedlung liegen die Windschirme ungefähr in einem Kreise, und beim Windschirm des Werftoberhauptes befindet sich auch das Sochafeuer. In warmen Nächten schlafen die Buschmänner übrigens nicht im Windschirm, sondern außerhalb desselben.

KOCH- UND KÜCHENGERÄTE

Als Herdsteine dienen meist Brocken von Oberflächenkalk. Da und dort findet sich als seltene Rarität ein Klopfstein aus Quarzit.

Zum Zerstoßen der Feldkost dienen kleine holzgeschnitzte Mörser mit spitzkonischem oder halbkugelförmigem Boden. Falls sie schadhaft werden, macht man beiderseits des Sprunges Löcher und zieht den Spalt mit Bastatreifen zusammen, verschmiert ihn überdies mit Harz. Die Form des Stößels, der etwa 50 cm bis 1 m lang ist, zeigt Fig. 7.

Ursprünglich haben diese !Kung keine Töpfe gehabt und hatten wohl überhaupt keine Möglichkeit, zu kochen. Die gewöhnliche Zubereitungsart der Nahrungsmittel ist auch jetzt Rösten und Braten auf und zwischen heißen Steinen. Heute besitzt wohl jede Horde einige Töpfe vom Okawango, die mit einem Bast- oder Sehnengeflecht umgeben sind und auf dem Marsche, an diesem befestigt, getragen werden. Die Okawangoleute geben diese Wassertöpfe, die sie auf der Durststrecke mit sich geschleppt hatten, zwischen Karakowisa und Nuragas gerne gegen Nahrungsmittel an die Buschmänner ab.

Kleine gußeiserne Dreifüße sind ein sehr beliebter Artikel. Ein längliches, roh zugeschnittenes Umrührholz, sowie ein Stück hartes Holz zum Zurichten des Feuers vervollständigen das Inventar der Buschmannküche. Löffel sind unbekannt.

BEKLEIDUNG

Die Ausrüstung der Frau besteht, wie ja bereits wiederholt beschrieben wurde, aus einem Vorderschurz und einem Hinterschurz aus weichem Leder und einem Mantel aus Leder, ungefähr von der Form einer Pelerine. Gewöhnlich hat sie noch ein Tragfell für das Baby. Dieses sitzt freilich im allgemeinen nicht so wie bei den Schwarzen auf dem Rücken, sondern seitlich auf der Hüfte. Dazu kommt noch die große Feldtasche, in welcher sie die Ergebnisse ihrer Sammeltätigkeit aufbewahrt. Ausgerüstet ist die Frau auf dem Marsche mit dem einfachen, unten zugespitzten Grabstock.

Die Männer sind nur mit dem Schamschurz bekleidet und tragen außerdem die kurze Fellpelerine, mit der sie sich beim Schlafen zudecken. Im dornigen Terrain tragen sie vielfach Sandalen aus Elandsleder und auch Fellgamaschen. Während die Frauen immer barhaupt gehen, haben die Männer doch des öfteren eine Kopfbedeckung, teils runde Fellmützen, manchmal auch spitze Fellhütchen und selbstgefertigte Strohhüte. Am Oberarm tragen sie einen eng anschließenden Lederring, an welchem ein kleiner Beutel mit den wichtigsten Utensilien, das ist Feuerzeug, Pfeife, Tabak, etwas Geld und last not least innerhalb der Polizeizone der Paß, enthalten ist.

Europäische Decken wollen sie nicht. Diese fangen zu leicht Feuer, saugen sich in der Regenzeit mit Wasser voll, sind schwerer zu tragen und ein Hort der Läuse. Dagegen sind Kattunstoffe und Hemden sehr beliebt. Machte ich bei einer Horde Studien, so war der Effekt immer die Konfektionierung aller Gewährsleute. Am ersten Tag bekommt der Gewährsmann ein Hemd, am zweiten ein farbiges Lendentuch, dann ein Kopftuch, ein Feuerzeug, Tabak, etwas weißes Geld, und dann wird er krank und verschwindet, während ein anderer oder andere zur Ausstaffierung antreten. Der

Besitz alter Uniformstücke gilt als Abzeichen höherer Stellung. Auf den Farmen kleiden sich die Buschfrauen, sobald sie können, nach Hereroart, tragen den hohen Turban und finden es sehr unschicklich, ihn abzunehmen. Nach europäischen Schuhen besteht ziemliche Nachfrage. Nichts fürchten nämlich die Buschmänner mehr als die Verletzung der Sohle durch die langen Dornen. Wie alle Völker, die heute scheinbar im Stadium einer Holz- oder Knochenkultur leben, besitzen auch die Buschmänner die drei wichtigsten Eisenwerkzeuge: die kurze Axt, von den Schwarzen eingehandelt, eine Ahle und ein Taschenmesser. Die ganz kleinen Kinder laufen nackt, später bekommen sie kleine Schürzchen, die bei den Mädchen oft mit Perlstickerei schön verziert sind. Außerordentliches Gewicht wird auf den Schmuck gelegt. Dieser besteht in erster Linie aus Straußeneiperlen. Einzelne !Kung sind Meister in der Herstellung derselben und bringen es durch den Handel damit zu einem gewissen Wohlstand. Diese Arbeit wird von den Männern gemacht. Auf Sehnen oder Bastschnüren werden die Perlen zu langen Ketten aufgereiht und um den Hals getragen. Kleine, aus 3–4 Gliedern bestehende Kettchen werden an einzelne Stirnhaarbüschel gebunden und ziehen diese dann in die Länge. Manche besitzen deren eine ganz große Anzahl, so daß sie die ganze Stirn bedecken. Kinder besitzen oft kleine viereckige und Frauen große runde, medaillonartige Anhänger, die gleich einem Diadem mitten auf der Stirn getragen werden. Kettchen aus kleinen Straußeneiperlen bis zu 5 cm Länge werden auch als Ohrgehänge getragen. Den Kindern gibt man auch Armbänder und Fußbänder aus Straußeneiperlen. Messingperlen aus alter Zeit sind selten und werden durchweg nur als Haranhänger getragen, ebenso solche aus Kupfer. Glasperlen sind wenig geschätzt und wenn überhaupt, so werden nur solche von blauer Farbe getragen. Häufig dagegen sind Holzperlen aus wohlriechendem Holz. Längere Kettchen, abwechselnd aus Holz und Straußeneiperlen, im Haar getragen, sind Abzeichen der Doktorinnen. Die Männer haben eng anliegende Lederriemchen am Hand- und Fußgelenk, die wohl zur Festigung der Muskulatur beim Laufen und Bogenschießen dienen. Außerdem wenig Armbänder aus Messing oder Eisen. Um den Hals trägt jeder Buschmann und auch jede Frau eine Schnur, an der vorne ein oder zwei Appetithölzchen (s. d.) und verschiedene Talismane befestigt sind. Schließlich tragen viele Männer um den Hals ein Hörnchen mit verschiedenartiger Medizin. Die jüngeren Buschmannfrauen und -mädchen besitzen meist auch die Schildkrötenpuderdose in derselben Art, wie sie weiter unten bei den Daman beschrieben wird. Körperbemalung wird kaum geübt, über die Tatauierung s. S. 31. Die Kinder tragen gelegentlich selbstgefertigte Armbänder aus Gras oder verschiedenen Früchten.

Fig. 9. Bestickter Vorderschurz aus Leder (!Kung).

WAFFEN

Die Hauptwaffe des Buschmanns sind Bogen und Pfeil. Der Bogenstab hat in der Regel einen runden Querschnitt und verjüngt sich mäßig nach beiden Enden. Die !Kung des Otjimpolofeldes verwenden dagegen gleich den Owambo Palmholz. Dort ist das Bogenholz außen leicht konvex, innen flach mit kantigen Seiten. Die Sehne ist aus Leder, so daß bei diesen Bogen der Bogenstab elastischer ist als die Sehne. Ein Bogen der Otjimpolobuschleute war 115 cm lang und 13 cm hoch. Auch die Bogen der hier besprochenen !Kung haben an beiden Seiten Widerlager aus Leder und oft Verstärkungen aus Sisalschnüren. Die Bogen der Hei//om scheinen von jenen der !Kung hauptsächlich dadurch unter-

schieden zu sein, daß bei ihnen der Bogenstab außen flach und innen konvex ist. Statt der Lederstreifen werden oft auch Verstärkungen aus Palmbast angefertigt. Die Sehne besteht je nach der Gegend aus einer gewachsten Pflanzenfaserschnur, aus Tiersehne (Kudu) oder feingedrehtem Leder. Länge etwa 120 cm, Höhe 30 cm. Doch gibt es auch viel kleinere Bogen mit 95–110 cm Länge.

Das Bogenholz der !Kung heißt !howa. Der Pfeil ist ein Holzpfeil, der Schaft heißt //gau, die Befiederung, bald radiär, bald Stegfiederung, !khui. Der Einschnitt am unteren Ende des Pfeilschaftes heißt /gei. Als Pfeilspitzen werden durchweg dreieckige Eisenplättchen (//khai) verwendet. Die ganze Spitze inklusive der Bindung und der vergifteten Partie heißt !hui.

Fig. 10. Boophane disticha Herb. Pfeilgiftpflanze der !Kung. (Ex Medley Wood. Natal Plants VI. 1912.)

Fig. 11. Acocanthera venenata. Pfeilgiftpflanze der !Kung. (Ex Sim: The Forests and Forest Flora of the Colony of the Cape of Good Hope, 1907.)

Die Pfeile sind 65–68 cm lang. Meist werden sie vergiftet. Das Gift, welches wie dunkles Wachs aussieht, wird auf Stäbchen aufgeschmiert konserviert. Es besteht aus 5 Ingredienzien, deren wichtigste Euphorbiensaft ist. Es sind ganz bestimmte Leute, welche das Gift herstellen. Sie wissen auch, daß die Pflanzengifte nicht jedes Jahr gleich wirksam sind. Daher wird erst ein kleines Buschböckchen geschossen, dann ein größeres Tier (etwa ein Leopard) und schließlich ein Gemsbock. Erst wenn bei allen diesen Tieren der Erfolg vorschriftsmäßig eintritt, wird das Gift verhandelt.

Die Lanzen der !Kung bestehen aus einem etwa 160 cm langen Schaft, der gegen das hintere Ende zu stark verdünnt ist. Das Blatt wird aus einem viereckigen Eisenstück hergestellt, ist 30–40 cm lang und mit einem kurzen Ansatzstück in den Schaft eingelassen, der an dieser Stelle durch Eisendrahtgewinde verstärkt ist.

MUSIKINSTRUMENTE

Große Tanztrommeln sind sehr beliebt, werden aber nicht selbst erzeugt, sondern von den Okawangos eingehandelt. Als ich einmal einem Straußeneiperlenhändler in der Gegend von Kuntsas eine solche Trommel abkaufte (sie gehört immer einer bestimmten Person, Kollektiveigentum an Gebrauchsgegenständen kennt der Buschmann nicht), bat er mich, ihm die Trommel noch bis zum Abend zu lassen, damit jeder Mann noch einmal trommeln könnte. Die Tanzrasseln aus Früchten sind nur mehr in ganz geringer Zahl vorhanden. Die !Kung sollen auch Holztrompeten besitzen, die bei bestimmten Anlässen Verwendung finden. Gesehen habe ich sie nicht.

Schließlich seien noch einige wenige besondere Gebrauchsgegenstände erwähnt. Die Doktoren besitzen zur Ausübung ihres Berufes Schröpfköpfe aus Antilopenhorn und abgestumpfte Hölzchen zum Zahnausschlagen. Gift und Medizinen werden heute in leeren Konservenbüchsen hergestellt und gekocht, wie überhaupt die Konservenbüchse und der Benzinbehälter aus Blech allmählich auch bei den Buschmännern die Universalgegenstände werden. Für bestimmte Fälle werden Botenhölzer oder Kalenderhölzer angefertigt, das sind Stäbchen oder Brettchen mit einer oder zwei Reihen Löchern. Sage ich dem Buschmann etwa, ich werde in 5 Monaten wiederkehren, so zieht er eine Schnur durch 5 dieser Löcher und verknotet sie. Bei jedem Vollmond wird die Schnur um 1 Loch zurückgezogen.

Fig. 13. Tanztrommel der !Kung (Kuntsas). (Stark verkleinert.)

12. SOZIALE ORGANISATION

Jede Sippe hat einen Häuptling, dessen Würde erblich ist. Freilich sind seine Machtbefugnisse nicht bedeutend, weil sich das ganze Leben sozusagen vor aller Augen abspielt und die Autorität der alten Männer so groß ist, daß die Beschlüsse, die gefaßt werden, im wesentlichen einer Übereinstimmung des Häuptlings und der übrigen Alten entspringen. Wenn das Werftoberhaupt stirbt, übernimmt nicht sein ältester Sohn, sondern der älteste Sohn der

Fig. 14. Kalenderholz der !Kung (n. Gr.).

Schwester die Werft. Es bestehen bestimmte Heirats-Verbote und -Gebote, die durch das folgende Schema illustriert werden.

Vaterbruder × Frau	Vater × Mutter	Vaterschwester × Mann
Bruder—Schwester	A—Schwester	Kousin—Kousine.

Wenn A der Proband ist, dann sind die Kinder des Vaterbruders seine Geschwister, die Kinder der Vaterschwester aber Vettern. Eine Heirat zwischen diesen Vettern ist verboten. Dagegen muß A die eine Tochter des Vaterbruders heiraten, falls diese will. Der Mann seinerseits kann aber das Mädchen nicht zur Ehe zwingen. Natürlich erinnern sich diese Schwestern gewöhnlich erst dann ihrer Rechte, wenn sie einen anderen Mann, den sie sich gewünscht haben, nicht bekamen. So werden die jungen Leute oft gezwungen, Mädchen zu heiraten, die viel älter sind als sie selbst. Stirbt die Ehegattin, dann muß der Witwer eine Schwester seiner Frau heiraten, falls diese damit einverstanden ist.

Stirbt dagegen der Mann, dann muß die Witwe etwa ein Jahr bei den Schwiegereltern bleiben. Man darf nicht die Frau oder die Kinder des verstorbenen Bruders heiraten. Die Witwe muß ihren Mann von einer anderen Sippe bekommen und zieht auf dessen Werft[1]. Die Knaben gehören zur Sippe des Vaters, die Mädchen zur Sippe der Mutter. Zu den Aufgaben des Werftoberhauptes gehört auch die Hütung des Socha-Feuers. Socha heißt rein oder heilig oder Tabu. Speisen, die für bestimmte Altersklassen oder ein Geschlecht verboten sind, sind für diese „Socha". Das Wort „Socha" scheint mir entweder ein sehr altertümliches zu sein oder es ist ein Lehnwort aus einer anderen Sprache. Jeder Platz hat mindestens zwei Feuer. Das gewöhnliche, wo alle Platz nehmen können, und das Socha-Feuer, bei dem nur die Männer sein dürfen. Wenn die Werft übersiedelt, dann nimmt das Familienoberhaupt das Sochafeuer mit. Während des Marsches wird Feldkost gesammelt. An dem neuen Platze angekommen, macht das Familienoberhaupt unter einem hohen Baume mit dem Sochabrand ein neues Sochafeuer an und röstet die Feldkost. Die Jungen verlassen den Platz sogleich und gehen auf die Jagd, während die Frauen und Mädchen die Windschirme zusammenstellen. Was der Alte am Sochafeuer gebraten, soll er allein essen; er tut es auch gewöhnlich. Endlich kommt ein Bote und meldet, daß ein Stück Großwild zur Strecke gebracht ist. Stunden vergehen, der Alte sitzt stumpfsinnig da, während es sich Frauen und Kinder in dem neuen Windschirm bequem machen. Das Wild wird zum Sochafeuer gebracht, die Keulen und das Blattfleisch werden herausgeschnitten; das bekommen Frauen und Kinder. Diese dürfen niemals Fleisch vom Knochen essen. Alles übrige wird am Sochafeuer von den Männern verzehrt. Das Werftoberhaupt hat auch die Aufgabe, das Fest der ersten Feldfrüchte zu veranstalten. Es ist bei den von mir besuchten Horden nicht mehr im Gebrauche. Vedder hat es von den !Kung von Gaub beschrieben.

Fig. 15. Dachspfeife der !Kungbuschleute. (Aus dem Lindenmuseum Stuttgart. 29464.)

Als Oberleutnant Fischer 1908 von Namutoni zum Okawango ritt, hatten die Buschleute überall noch eine straffe Organisation und einen gemeinsamen Kapitän. Hauptmann François fand, als er zum erstenmal über Grootfontein hinausging, viele Unterstützung seitens des Oberhäuptlings der !Kungbuschleute. Es verdient vermerkt zu werden, daß die berühmten Kupferminen von Tsumeb, auf denen der Wohlstand Südwestafrikas zum großen Teil beruht, von einem Buschmannhäuptling[2] entdeckt wurden. Derzeit haben die Ost-!Kung keinen Oberhäuptling mehr. Die Nord-!Kung sollen noch einen besitzen. Der älteste Häuptling, von dem mir erzählt wurde, war „χ'amme", der Löwe. Er war ein großer Jäger. Er starb, als sein Nachfolger Amme noch ein kleiner Junge war. Amme konnte

[1] „Das Schicksal mancher jungen kinderlosen Witwe ist allerdings viel schlimmer. Ein Buschmann teilte darüber folgendes mit: ‚Wenn ein Mann stirbt und eine Frau ohne Kinder hinterläßt, der Schwager aber sich weigert, den Bogen seines Bruders und damit die Schwägerin anzunehmen, so kann sie zur Werft ihres Vaters zurückkehren. Dies geschieht aber keineswegs immer. Als Frau, die nicht gehört, wird sie nicht geachtet. Ihr Leben hat keine Bedeutung. Die Männer der Werft reden über den Fall und bestimmen einen aus ihrer Mitte, das unnütze Leben zu vernichten. Dieser Mann kommt dann abends zur Hütte der Witwe und setzt sich ihr gegenüber an ihr Feuer. Er hat Bogen und Pfeil bei sich. Die Witwe weiß, was ihr bevorsteht, läßt sich aber nichts merken. Beide reden miteinander über nebensächliche Dinge. Nach einer Weile nimmt der Mann seinen Bogen zur Hand und schießt einen Pfeil durch das Herz des ihm gegenübersitzenden Weibes. Die Unglückliche stirbt und wird möglichst bald und unauffällig verscharrt. Blutrache von seiten der Sippe dieses Weibes ist nicht zu befürchten. Sie hat ja keine Kinder geboren'." (Zastrow und Vedder, l. c. 419.)

[2] Dieser selbst war ein Bastard.

aber von seinem Vater nicht viel lernen, er war kein guter Häuptling und ist auch in jungen Jahren gestorben. Seitdem haben die !Kungbuschleute keinen Oberkapitän. Einer meiner Gewährsmänner, Doktor χ'amme, behauptete, der Urenkel des großen Häuptlings gleichen Namens zu sein.

Nach v. Zastrow und Vedder[1] wäre noch zu erwähnen:

„Der Vater ist das Oberhaupt der Familie. Alle haben ihn zu respektieren. Kinder dürfen ihn nicht mit seinem Namen rufen. — Die Häuptlingswürde erbt sich im allgemeinen vom Vater auf den Sohn weiter. Ist der Sohn beim Tode des Vaters noch unerwachsen, so tritt der jüngere Bruder des Vaters an dessen Stelle. Jede Sippe hat seit uralten Zeiten ein angestammtes Sippengebiet. Das Gebiet wird Gou genannt und dürfte sich mit dem deutschen Begriff Gau decken.

Es gibt Sippen, die Tagereisen weit auseinander liegen. So gehört der Landstrich nördlich des Omuramba-Owambo bei Kajou, wo der Mankettibaum (Rizinodendrum Bantanesi) vorkommt, einer Sippe, die für gewöhnlich über 100 km weit entfernt wohnt und nur dorthin kommt, wenn die ölhaltigen Früchte reif sind.

Sippen mit zwei Jagd- und Sammelgebieten entstehen auch durch Verschmelzung zweier Sippen, die so lange untereinander geheiratet haben, bis die Verschmelzung sich von selbst ergab.

Innerhalb des Gebietes der Sippe befinden sich die Gräber der Ahnen. Sie sind durch große Steinhaufen, die darauf gefügt sind, gekennzeichnet. Man hält die Ahnen für Wächter des Sippengebietes. Das Verlassen des Sippengebietes muß daher vom Häuptling oder einem Alten ohne besondere Feierlichkeiten am Ahnengrabe angekündigt werden; ebenso muß an diesem Orte Mitteilung gemacht werden, wenn die Sippe das Gebiet wieder bezieht."

Zum Eigentum der Sippe gehört außer dem Sippengebiet die Feldkost, das Jagdwild und vor allen Dingen die Wasserstelle.

13. KRANKHEITEN UND HEILBEHANDLUNG

Die anatomischen Kenntnisse der Buschleute sind bei ihrem Jägerleben verhältnismäßig groß.

Das Herz gilt als der Sitz des Lebens. Auch der Atem wird mit dem Herzen in irgendeinen Zusammenhang gebracht. Ihre chirurgischen Kenntnisse beschränken sich auf das Ausziehen von Dornen mit einem ahlenartigen Instrument und auf die relativ gute Bandagierung von Hand und Beinbrüchen. Ihr Medizinschatz dagegen ist sehr gering. Ich gebe nun im folgenden eine Aufzählung der gewöhnlichen Krankheiten und ihrer Behandlung.

Fig. 16. Kratzerartiges Instrument. Eisenblatt mit Harz und Lederstreifen an einem Stäbchen befestigt. (Museum für Völkerkunde, Hamburg; n. Gr.)

AUGENENTZÜNDUNG

Sowohl trockene wie exsudative Augenentzündungen, hervorgerufen durch Sand und reizende Grassamen, sind überaus verbreitet, und Triefäugigkeit ist bei älteren Leuten die Regel, doch sind diese Erkrankungen bei den im Walde lebenden !Kung lange nicht so schwer als etwa bei den Buschmännern der West-Kalahari oder bei denen der Naukluft. Bei letzteren gilt das Triefauge sogar als Schönheitszeichen bei jungen Mädchen. Gewöhnliche Augenentzündungen, die in kurzer Zeit vorübergehen, bedeuten nichts. Sie werden durch Einreiben mit Fett behandelt. Dauert die Erkrankung jedoch länger, dann hat der //Gaub sicher etwas hineingetan, man ruft den Doktor, und dieser produziert nach einiger Behandlung eine „kleine schwarze Medizin" aus dem Auge.

Einseitige Erblindung ist sehr häufig infolge von Verletzungen durch die Dornen. Bei ganz alten Leuten habe ich auch Erblindung durch grauen Star gefunden. Da und dort trifft man auch Buschleute, die in alter Zeit von den Hereros gefangen worden waren, die ihnen mit Grassamen die Augen ausgeschossen hatten.

OHRENERKRANKUNGEN

Sie sind verhältnismäßig selten. Bei gewöhnlichen Ohrenschmerzen stopft man Blätter ins Ohr, „damit es warm bleibt". Auch hält man das schmerzende Ohr übers Feuer, in welches man einige Medizin gegeben hat. Kommt Eiter aus dem Ohr heraus, dann hören die Schmerzen auf und alles

[1] l. c., S. 412, 424.

ist gut. Wenn aber der //Gaub etwas hineingegeben hat, dann werden die Schmerzen so stark, daß man nicht mehr schlafen kann, und man hört gar nicht mehr. In solchen Fällen muß man einen besonders mächtigen Doktor rufen, der die Krankheitsgeister herauszieht, sonst stirbt der Patient.

Fig. 17. !Kung-Instrument zum Zahnausschlagen; n. Cr.

ZAHNLEIDEN

Stellungsanomalien habe ich selten beobachtet, Prognaie oder Opisthognaie niemals. Die einzige Zahnpflege besteht darin, daß sie die eisernen Pfeilspitzen als Zahnstocher benutzen. Die Zähne sind daher meist gelb, mit dichten Lagen von Zahnstein bedeckt und werden bei dem Sandgehalt der vegetabilischen Nahrung sehr rasch abgekaut. Zahnkaries ist außerordentlich häufig, doch kommen Infektionen auch durch Eröffnung der Wurzelkanäle infolge Abkauung vor. Wenn man starke Zahnschmerzen hat, dann hat der //Gaub eine Nadel hineingesteckt, und man muß den Doktor rufen, damit er sie herausholt. Ist jedoch kein allgemeines Übelbefinden vorhanden, dann sind auch keine Dsao da. Man nimmt ein Stäbchen Holz, macht es an einem Ende spitz, hält es mit der Spitze auf die Wurzel des Zahnes und schlägt mittels eines Steines den Zahn heraus. Dieses Instrument heißt „oie". Die kleinen Kinder haben große Schmerzen, wenn sie zahnen, manchmal sind auch Dsao (Krankheitsgeister) dabei im Spiele.

HALSSCHMERZEN

Sie entstehen dadurch, daß der //Gaub einen Faden macht und damit dem Kranken den Hals zuschnürt. Der Doktor muß dem Kranken den Faden herunternehmen, er ist etwa 30 cm lang und von der Art der Falkenfäden (//Kao), jeder kann ihn nach der Behandlung sehen.

ERKÄLTUNGSKRANKHEITEN (χ'ôâ)

Die Grippe fordert alljährlich viele Opfer unter den Buschleuten, besonders unter jenen, die bereits tuberkulös infiziert sind. Erkältungen sind im Winter außerordentlich häufig, liegen die Leute doch fast nackt um die Feuer. Im Walde sind sie ja ziemlich windgeschützt, aber auf offener Fläche kommt noch hinzu, daß der Wind des Nachts umschlägt, während sie schlafen, so daß sie sich erkälten und außerdem oft schwere Verbrennungen in der Magengegend erleiden – allerdings nur die Männer, die Frauen liegen weiter entfernt vom Feuer. Gegen Husten und Heiserkeit kauen sie die Fasern einer sisalähnlichen Pflanze, aus der die Falkenfäden gedreht werden. Die Pflanze heißt kâi. Sie muß frisch aus dem Walde geholt werden. Gegen Brustschmerzen trinken sie neuerdings warmes Wasser, dem viel Kochsalz zugesetzt ist.

GEFÄSSERKRANKUNGEN

Ähnlich wie bei den zentralafrikanischen Pygmäen, finden wir schon bei jugendlicheren Individuen starke Schlängelung der Arteria temporalis. Das Herz nutzt sich bei der erschöpfenden Lebensweise und dem vielen Laufen rasch ab. Man sucht seine Leistungsfähigkeit auf alle mögliche Weise zu heben. Um Herzklopfen zu vertreiben und länger im Laufen auszuhalten, nehmen sie die Blätter eines Baumes mit roten Früchten (!n-gui). Diese werden gekaut und geschluckt. Nützt das nichts, dann kaut man die Wurzel des γ'Na-Baumes. Ist jemand auf dem Herzen krank, so daß er nicht laufen kann, dann nimmt man Wurzeln des Dornakarbusches (!gu) und des Hellbusches (!gai !dsao), kocht beides und trinkt den Absud. Bei Angina pectoris legt man die Haut einer Riesenschlange um die Brust.

MAGEN-DARMERKRANKUNGEN

Es ist interessant, daß die Lehre von der Bedeutung von Leber und Galle für die Krankheitsentstehung, die wir bei allen Natur- und Kulturvölkern bis in die Humoral-Medizin des vergangenen Jahrhunderts finden, schon bei den Buschmännern vorhanden ist. Wenn die Galle voll ist, wird man krank und erbricht Galle. Dann massiert man die Lebergegend ebenso wie bei Leberschmerzen. Lebervergrößerung infolge chronischer Malaria sind häufig. Auch der Mond, der allmonatlich stirbt, ist an der Galle krank, und das Mondlicht ist der von ihm erbrochene Gallensaft. Mondschein und Galle haben dasselbe Wort (goo). Milztumor ist besonders bei Kindern häufig. Eine Medizin gegen Milzstechen haben sie nicht. Um Erbrechen herbeizuführen, haben sie keine Medizin. Dies wird durch Einführen des Fingers oder einer Feder in den Mund herbeigeführt. Um Erbrechen zu stillen, kaut man Ästchen des Gorobaumes. Gegen Magenschmerzen kaut man das bittere Stammholz der Liane (χ'áá-χ'áß). Bei Verstopfung muß der Doktor zaubern. Man nimmt nämlich an, daß die Dsao den Stuhl im Darm festgebunden haben, und der Doktor muß den Faden losmachen und herausbringen, genau so wie bei der Halsentzündung. Der Patient darf nichts essen und nur wenig trinken. Bei Durchfall, auch bei blutigem, wird dieselbe Medizin genommen wie bei Magenschmerzen. Eingeweidewürmer sind ihnen nicht bekannt. Wir wissen schon aus vielen früheren Berichten, daß der Magen-Darm-Traktus des Buschmannes mancherlei verträgt, was wir nicht vertragen. Er kann etwas in Fäulnis übergegangenes Fleisch und dergleichen infolge Gewöhnung von früher Kindheit an ohne weiteres vertragen[1]. Er kann nach langem Hungern ungeheure Quantitäten vertilgen, aber solche Exzesse haben in der Regel eine Indisposition zur Folge. Am Tage nach einem größeren Schmause liegen fast alle mit Magenschmerzen und Bauchgrimmen in der Sonne. Man darf also auch einem Buschmann in bezug auf Ernährung nicht Unmögliches zutrauen; viele Dinge, die uns ekelerregend erscheinen, wie Regenwürmer, Eidechsen, dicke Raupen, Mäuse usw., sind an und für sich gar nicht gesundheitsschädlich, zumal sie ja der Buschmann nur in gekochtem oder gebratenem Zustand zu sich nimmt. Buschmänner, die auf den Farmen aufgewachsen sind, vertragen dieselbe Kost wie die Weißen oder Schwarzen. Dagegen können sich die bei Feldkost und Wildfleisch aufgewachsenen wilden Buschleute nicht an die Arbeiter- und Gefängniskost der Schwarzen gewöhnen. Bei den meisten der zu längerer Gefängnisstrafe verurteilten Buschmänner bedeutet dies eine Verurteilung zu langsamem, aber sicherem Hinsterben. Die Gefangenen erkranken unter den Erscheinungen einer Avitaminose, werden hinfällig, bekommen Ödeme an den Beinen, Hydrops und gehen unfehlbar zugrunde. Im Anfangsstadium stellt sich schwere Darmträgheit ein. Reichliche Zugaben von frischem Fleisch können den Buschmann auch in der Gefangenschaft gesund erhalten. Das Entlaufen der Buschmänner von den Farmen beruht in den meisten Fällen auf der Unmöglichkeit, die verabreichte Kost weiter zu ertragen. Das Vitaminbedürfnis des in der Wildnis aufgewachsenen Buschmannes ist zweifelsohne viel größer, und seine Sucht nach Fleisch, die oft fast krankhaft erscheint, kann als ein physiologischer Vitaminhunger erklärt werden.

ERKRANKUNGEN DES UROGENITAL-APPARATES

Blasenkatarrhe kommen vor, man wärmt dann einen flachen Stein im Feuer und legt ihn auf die Blase. Blutharnen, offenbar infolge von Nephritis, hat mein Freund Dr. Kasl zweimal behandelt. Die Leute sind gestorben. Es waren ganz böse Dsao dabei. Die Terminologie für die Beschreibung der äußeren Genitalien ist lange nicht so reichhaltig wie bei den Bantu. Die Schamhaare werden den Frauen meist von ihren Männern ausgezupft. Sie heißen darum Jungfrauenhaare. Der Zusammenhang

[1] Ein drastisches Beispiel dieser Art habe ich selber erlebt. Ich hatte von Swakopmund her eine Speckseite mitgebracht, die angeblich nach einem besonderen Verfahren für die Ewigkeit konserviert war. Als ich sie hervorzog, entwickelte sie einen abscheulichen Geruch, und damit sie die Buschmänner nicht nahmen und sich den Magen verderben, ließ ich sie hoch auf einen Baum aufhängen. Sehnsüchtig starrten die Buschmänner nach dem mißfarbenen Fettklumpen. Schließlich schickten sie mir eine Deputation, sie möchten den Speck für ihre Hunde haben. Kaum hatten sie ihn, wurde er kunstgerecht nach Familien verteilt und im Zug eines großen Festes ohne jeden Schaden vertilgt.

zwischen Kohabitation und Schwängerung ist bekannt. Impotenz und Unfruchtbarkeit kommen vor, man hat keine Medizin dagegen. Falls die Menstruation ausbleibt, wird nichts Besonderes unternommen. Die menstruierende Frau darf nur mit ihrem Ehemann zusammen essen und nicht überall herumkosten. Bei Menstruationsschmerzen legt man einen warmen Stein auf den Bauch. Die Kinder werden mindestens bis zur Geburt des nächsten Kindes gestillt. Die Brustwarzen zeichnen sich durch eine lederartige Festigkeit aus. Trotzdem kommen Mastitiden manchmal vor.

Die Behauptung, daß Geschlechtskrankheiten sehr verbreitet sind, ist nicht richtig. Den Buschmännern selbst sind sie als solche überhaupt nicht bekannt. Vereinzelt habe ich auf den Farmen Buschleute mit veralteten Gonorrhöen getroffen. Syphilis ist bei den wilden Buschmännern sehr selten.

HAUTKRANKHEITEN

Eine Hautpflege kennt der wilde Buschmann kaum. Da es sowohl an Wasser wie an Fett fehlt, wird die Haut, die sich in der Regel samtartig, weich, warm und trocken anfühlt, in der Trockenzeit rissig und es entstehen leicht Infektionen. Sehr weit verbreitet ist ein offenbar von einem Pilz hervorgerufenes chronisches Ekzem (gari). Gegen dieses verwendet man den Milchsaft einer Pflanze, die Timba heißt.

HAARKRANKHEITEN

Eine auch bei allen Bantu sehr verbreitete, gutartige Haarerkrankung, bei welcher in ungefähr kreisförmigen Flecken das Haar ausfällt, ist auch bei den Buschmännern vorhanden. Daneben kommt aber auch, wie bei den Buschmännern der Naukluft, der sogenannte Porzellankopf vor, bei welcher Krankheit der ganze Haarboden zerstört wird und die Glatze wie Porzellan glänzt. Ergrauen der Haare tritt relativ früh auf. Haarausfall ist selten, er vollzieht sich meist in Form der für Schizothyme charakteristischen Glatzenbildung. Die gewölbten Fingernägel werden ziemlich lang getragen, die Zehennägel sind oft zerklüftet.

INFEKTIONSKRANKHEITEN

Die Buschmänner werden von den zwei gefährlichsten chronischen Infektionskrankheiten, der Tuberkulose und der Malaria, bedrängt. Lepra fehlt.

Die Malaria tritt alljährlich in der Regenzeit auf. Dann wirft man die Bischwurzeln ins Feuer und atmet den Rauch ein. Kleine Kinder sterben öfter daran. Fälle von Schwarzwasserfieber oder Malariakachexie habe ich nicht beobachtet.

Die Tuberkulose ist die gewöhnliche Todesursache der Buschmänner. Ich sah sowohl Knochentuberkulose, Drüsenanschwellungen und fortgeschrittene Fälle von Lungen- und Kehlkopftuberkulose. Die armen Leute stehen dem vollkommen hilflos gegenüber, und die häufigen Erkältungen fördern die Prozesse in gefährlicher Weise. Als in kleinen Gruppen lebende Nomaden sind sie vor den Seuchen der Weißen und Schwarzen im allgemeinen verschont. Wird jedoch eine Seuche einmal eingeschleppt, dann sterben sie massenhaft dahin. Interessant ist, daß die Buschmänner wissen, daß es ansteckende Krankheiten gibt. Als solche ist ihnen allerdings nur die obenerwähnte Hautkrankheit (gari) bekannt.

Die anderen infektiösen Allgemeinerkrankungen werden mit dem Überfall vieler Krankheitsgeister auf die Horde erklärt.

GEBURTSHILFE

Sieht eine junge Buschfrau ihrer ersten Niederkunft entgegen, dann bleibt sie bei den Hütten, weil sie sich fürchtet. Die älteren Frauen reden ihr gut zu, dann wird aus trockenem Gras ein Lager gemacht, und das Kind wird in hockender Stellung geboren. Bei Geburtsschwierigkeiten wird der Unterleib massiert. Medizin wird nicht gegeben und manuelle geburtshilfliche Eingriffe werden nicht gemacht. Die Nabelschnur wird mit einem Quarzmesser abgeschnitten und eingegraben.

VERWUNDUNGEN UND VERLETZUNGEN

Die gefährlichste Verletzung, die ein Buschmann erhalten kann, ist die durch den Giftpfeil. Man schneidet den vergifteten Pfeil heraus, nimmt ein Stück Holz, macht es glühend und brennt den Verwundeten an vielen Stellen des Körpers. Wenn das Gift die Wärme riecht, dann kommt es an diesen Stellen zusammen, dort werden dann Einschnitte gemacht und das Blut mittels eines Schröpfkopfes aus Gemsbockhorn ausgesaugt. Der Verwundete darf sich weder niedersetzen noch niederlegen, er muß 24 Stunden lang herumgeführt werden. Nach dieser Zeit stirbt er oder er wird gesund. Die Methode hilft nur in seltenen Fällen.

Die zweite große Gefahr sind die Schlangenbisse. Wenn man Einschnitte in die Unterschenkel macht und von einer Bisobwurzel etwas abschabt und in die Einschnitte hineinreibt, dann riechen die Schlangen das und kommen nicht hervor. Wenn man aber auf weite Strecken laufen muß, dann verreibt man Bisobstaub mit Fett und salbt damit die Beine ein. Falls doch jemand von einer Schlange gebissen wird, so ist die Behandlung analog der bei Pfeilschußverletzungen. Sehr häufig sind Verletzungen der Füße durch Eintreten von Dornen. Verletzungen, die durch die Aponeurose gehen, werden als tödlich angesehen. Sie infizieren sich so gut wie immer. Nehmen die Wundinfektionen auch einen weniger bösartigen und langsameren Verlauf als bei den Europäern, so führen sie doch manchmal zum Tode. Die einzige Medizin, die verwendet wird, ist Bisobpulver, das man in die Wunden streut.

Fig. 18.
Kirri der !Kung.

Einige Doktoren behaupteten gegen Schlangen- und Skorpionbisse unempfindlich zu sein.

Was Vedder bei Bergdama beobachtete, berichtet in gleicher Weise Schinz:

„In der Absicht, die letztere Eigenschaft zu prüfen, bewog ich eines Tages einen uns in Nol las am Ngamisee besuchenden alten Zauberer, das Experiment mit 12 von mir selbst gesuchten, durchschnittlich 8 cm langen Skorpionen (Buthus caudax Simon) an sich selbst vorzunehmen. Um jeden Betrug auszuschließen, brachte ich die Tiere mittels einer Pinzette auf die verschiedenen Körperteile, Hände, Beine, Arme, Mund und Hoden des Mannes, in der Regel bewegten sie dann sofort das lange Postabdomen erregt hin und her und stachen ein- oder zweimal heftig in das Fleisch des betreffenden Versuchsindividuums, wobei dem Stachel jedesmal ein großer Tropfen weißer Flüssigkeit entwich; schließlich wanderten sie ruhig umher, ohne weitere Stechversuche zu machen, zeigten aber auch keineswegs jene aufgeregte Hast, vom Körper des Buschmannes herunterzukommen, wie dies von einzelnen Berichterstattern schon angegeben worden ist. Der Alte behauptete, keinen Schmerz zu empfinden, und ich habe keinen Grund, ihm zu mißtrauen, da er sich doch kaum meiner Willbegierde zuliebe von Skorpionen an den empfindlichsten Stellen des Körpers hätte stechen lassen, wenn das Gift von irgendeiner Wirkung auf ihn gewesen wäre; selbst eine volle Stunde nach unserem Versuche zeigten die gestochenen Stellen noch nicht die geringste Veränderung. Der Mann erklärte, diese eigentümliche Fähigkeit dadurch erlangt zu haben, daß er als Junge in der ‚Schule' bei einem Zauberer dazu angehalten worden sei, mit Wasser und Urin verdünntes, den Skorpionen gewaltsam entnommenes Gift in kleine Schnittwunden zu bringen sowie zu Brei gestampfte und eingekochte Giftstacheln zu genießen; in entsprechender Weise soll auch die Präservation gegen Schlangenbisse erworben werden können."

14. DIE DOKTORENPRÜFUNG

Eines Nachmittags kam der Älteste der Horde vor Keibeb zu mir und teilte mir mit, in der Nacht würde ein großer Tanz stattfinden, erstens weil ein dreijähriges Kind soeben von einer kleinen schwarzen Schlange gebissen worden sei, zweitens weil viele Leute fieberkrank seien und drittens endlich, weil einer der Männer die Doktorenprüfung machen wollte. Solche Feste finden immer nur in der Zeit des Vollmondes statt. Gegen 9 Uhr abends lockte mich wilder Lärm ins Lager. Die Leute hatten etwas größere und mehr Feuer angezündet, als es sonst üblich war. In der Mitte eines offenen Halbkreises saß die Mutter mit dem von der Schlange gebissenen Kind. Rund um sie hockten die älteren Frauen. Abseits davon standen in einer Reihe hintereinander jüngere Frauen und Mädchen. Sowohl die männ-

lichen wie die weiblichen Doktoren waren in Tätigkeit. Die Oberdoktorin Biri war diesen Abend „persönlich" abwesend. Sie hockte abseits in der Dunkelheit im Busch. Von ihr hatte /Nawa, der oberste der //Gaunbs, Besitz ergriffen und sprach durch ihren Mund. Ihren Haarschmuck, lange Perlenketten aus Straußeneischalen, hatte ihre Stellvertreterin Dubo, eine sehr intelligente junge Frau, angelegt. Diese leitete, am Ende des Halbkreises der sitzenden Frauen stehend, das Fest. Sie war sehr guter Dinge und rauchte abwechselnd ihre Buschmannpfeife und meine Zigaretten. Unter den Frauen besteht irgendeine Rangordnung, und zwar waren die hockenden Weiber höher im Range als die stehenden. Alle Weiber klatschten in die Hände und sangen dazu in monotonem Rhythmus: ehe, ehe, ehe, ehe usw. Das war, wie mir versichert wurde, kein Lied, sondern „Musik". Manche Herden haben sich von den Okawangos 1½ m hohe Tanztrommeln eingehandelt, die bei diesem Anlaß von Männern bearbeitet werden. Bei den Buschmännern des Sandfeldes trägt nicht die Festleiterin den Schmuck der Oberdoktorin, sondern der Schmuck wird an einen Baum gehängt. Die Würde der Oberdoktorin ist nicht dauernd an eine Person gebunden, sondern der Oberdoktor verleiht ihr fallweise übernatürliche Kräfte.

Fig. 19. Zauberer mit Vogelmaske und Krankheitsgeistern im Gefolge. (Aus Rock Paintings in South Africa. From Parts of the Eastern Provinces and Orange Free State. Copied by C. W. Stow. With an introduction and descriptive notes by Dorothea Bleek. London Methuen 1930.)

Die fünf Doktoren hatten allen Schmuck abgelegt und waren bis auf den Vorderschurz nackt. Sie setzten sich durch Krähen, durch Hervorbringen von Lauten ähnlich den Bauchrednern und durch bestimmte Muskelkontraktionen in einen autohypnotischen Zustand. Dadurch, daß sie die Gluteusmuskulatur der Hinterbacken zusammenpreßten, dabei die Kniegelenke möglichst weit auseinander hielten und die Beine bei den Knöcheln zusammenpreßten, erzeugten sie mit der Zeit einen tonischen Zitterkrampf der gesamten Muskulatur der unteren Extremität, in welchem sie hin und her torkelten. Auf diese Weise ist es jedermann möglich, sich in einen autohypnotischen Zustand zu versetzen, wie dies Verfasser auch von den Doktoren gelernt hat. Bald zeigten die verdrehten Augen, daß sich die Doktoren im Trancezustande befanden. Sie tanzten durcheinander, fielen übereinander und hoben einander wieder auf. Einige Weiber fingen auch mit den Tanzrasseln zu lärmen an. Nach der Überzeugung der Buschleute tanzte nun /Nawa selbst unter den Doktoren, ist diesen sichtbar und spricht mit ihnen. Dazu sprechen sie etwas wie Gebete, sie rufen den großen Geist des alten Buschmannes an, der viele Elefanten getötet hat, sie rufen die Geister der Toten, die ihre Krankheitsgeisterchen über die Lebenden gesendet haben, und sie bitten insbesondere /Nawa, er möge diese Krankheitsgeisterchen auf die Doktoren übertragen.

Die Doktoren liefen abwechselnd zu dem gebissenen Kind und zu den Fieberkranken, die ringsherum bei den Feuern hockten, und strichen ihnen über die schmerzenden Körperstellen, sowie von den Achselhöhlen bis zu den Sohlen und von den Schultern bis zu den Fingerspitzen nach abwärts. Gelegentlich saugten sie auch an den erkrankten Stellen oder sogen den Atem ein, der aus dem Munde der Kranken kam.

Von Zeit zu Zeit vollführten die Doktoren diese Operationen gegenseitig an sich aus, zunächst, um, wie sie sagten, die Krankheitsgifte gleichmäßig auf alle Doktoren zu verteilen, dann aber auch, um sich Kraft von den anderen Doktoren zu holen. So „geladen" lief dann der Doktor wieder zu den Patienten, um Gift zu übernehmen.

Dann und wann lief der Oberdoktor schreiend um die Reihe der stehenden Frauen herum und

verschwand im Busch, um sich bei der Oberdoktorin nach der Willensmeinung /Nawas zu erkundigen. Nach etwa einer Stunde Tanzens begab sich der Oberdoktor zu dem gebissenen Kinde. Der Rücken, wo sich die Bißstelle befand, wurde mit Fett und einer Medizin eingerieben, dann wurden nochmals alle Patienten der oben geschilderten Behandlung unterzogen, und bald darauf verkündete /Nawa durch den Mund der Oberdoktorin, das Kind und auch die anderen Patienten würden gesund werden. Damit war der erste Teil der Zeremonie beendigt.

Nun begann die Doktorenprüfung, an der sich die übrigen, mit Ausnahme der musizierenden Weiber, nur mehr als Zuschauer beteiligten. Die Doktoren tanzten weiter, oft mit gegen Himmel ausgestreckten Armen und gespreizten Fingern, dann wieder sprangen sie zum Feuer und hielten die Hände über das Feuer. Das Werfen der Hände gegen Himmel bezweckte, einen Teil der Krankheitsgeisterchen dem Obergeist /Nawa zurückzugeben, der auf einem Faden zwischen Himmel und Erde auf und ab geht. Eine Gebetsgebärde ist das nicht. Auch das Halten der Hände über dem Feuer bezweckt das gleiche, weil die „Krankheitsgeisterchen" das Feuer nicht gerne haben und weggehen. Währenddessen dankten sie dem großen Geiste, daß er das Kind gerettet habe. Dann aber baten sie /Nawa, er möge alle Krankheitsgeisterchen auf den Doktorenkandidaten vereinigen und diesen töten, damit die Leute von den bösen Krankheiten befreit werden; der Sterbende nimmt nämlich die Krankheitsgeister mit sich. Durch Bestreichen, Reiben und Anblasen übertragen nun die alten Doktoren die Krankheitsgeister auf den Kandidaten. Dieser ist total erschöpft, bricht von Zeit zu Zeit zusammen, wird immer wieder hoch gehoben und taumelnd tanzt er mit Schaum vor dem Munde weiter. Die anderen Doktoren verhöhnen ihn: „Du Leopard, du Löwe, du Elefant, du unübersteigbarer Berg, du riesenstarker Mann, jetzt wirst du nicht mit den Krankheitsgeistern fertig, die wir dir gegeben haben." Noch einmal läuft der Oberdoktor zu dem ehemaligen Patienten und überträgt das etwa noch gesammelte Krankheitsgift auf den Kandidaten. 1½ Stunden dauerte dieser Höllenspektakel, dann begab sich der Oberdoktor zu seinem im Busch sitzenden Orakel und versicherte, der Kandidat ist zu stark, wir haben alle Krankheitsgeisterchen auf ihn vereinigt und den Obergeist gebeten, er möge ihn holen (töten), aber der Kandidat ist stärker als die Krankheitsgeister. Durch das Orakel befiehlt: „Es wird weitergetanzt". Während dies geschah, kam aus dem Hintergrunde eine Frau – ich konnte in dem Halbdunkel nicht ausnehmen, ob es die Oberdoktorin selbst war – und machte sich an dem eben geheilten Kinde zu schaffen, sie klatschte mit den Händen und schlug die Handflächen mit den Daumenseiten vor dem Gesicht des Kindchens aneinander und versetzte dasselbe auch in eine kurze Verzückung. Indessen wurde weiter getanzt, bis gegen 12 Uhr nachts endlich das Orakel erklärte, der Obergeist sei zwar noch nicht zufrieden, aber sie werde ihn beruhigen; der Obergeist nehme freiwillig die Krankheitsgeisterchen auch von den Doktoren weg. Nach diesen Worten schloß das Fest augenblicklich, die Leute gingen zu ihren Feuern und legten sich schlafen.

Der Kandidat hatte seine Prüfung bestanden[1].

[1] Burchell hat (in der Übersetzung von Hellwald, Völkerkunde II, S. 319) eine ähnliche Schilderung aus dem Süden gegeben: „Ein Fuß bleibt stehen, während der andere schnell und regelmäßig in Bewegung gesetzt wird, aber keine besondere Ortsveränderung erleidet. Die Arme werden nur unbedeutend bewegt. Dabei singt der Tänzer unaufhörlich und hält stets Takt mit den Bewegungen. Zuweilen neigt er den Körper und erhebt ihn dann plötzlich wieder, bis er zuletzt ermüdet sich auf den Boden niederläßt, fortwährend aber singend und den Körper im Takt bewegend, den der Gesang der Zuschauer angibt. Denn wiewohl nur eine Person auf einmal tanzt, so hat doch auch die anwesende Gesellschaft dabei zu tun usw."

Wenn die Aufregung des Tanzes ihren Höhepunkt erreicht hat und die Tanzenden durch die anhaltende Tanzbewegung, den gellenden Gesang, den Kaffergenuß und nicht zum wenigsten durch den Tabakrauch, den sie, um sich zu berauschen, minutenlang im Munde behalten, in eine Art Taumel verfallen sind, dann trampeln die Doktoren, um ihre Feuerfestigkeit zu beweisen, mit den nackten Füßen auf den glühenden Holzkohlen herum, die sie zu diesem Zweck dem Lagerfeuer entnehmen und im Sande ausbreiten. Doch glaube ich bei manchen der jüngeren beobachtet zu haben, daß es mit ihrer Feuerfestigkeit nicht so weit her war, wie sie glauben machen wollten, und daß sie vorsichtig die allzu heiß glühenden Stücke vermieden. Überrascht war ich dagegen, als gelegentlich eines solchen religiösen Tanzes der angenannte Großdoktor — nachdem er lange und anhaltend in sichtbarer Verzückung allein getanzt hatte, so daß ihm, trotz der kühlen Nacht und trotzdem er fast unbekleidet war, der Schweiß am ganzen Körper herunterlief — plötzlich mit langsamen, gravitätischen Schritten durch das hochaufloderende Feuer schritt, wobei er mit den nackten Füßen auf die brennenden Holzkohlen treten mußte.

Ich habe diese ganzen Vorgänge mit dem Oberdoktor Kasi, mit Dube und den anderen Doktoren späterhin eingehend durchgesprochen. Am meisten mag bei der ganzen Zeremonie das Fehlen des Geheimnisvollen und Zauberhaften auffallen. Diese Krankheitsgeisterchen sind keine magischen Wesen, sondern in den Augen der Buschmänner banale Realitäten. Die Buschmänner wissen sehr genau, daß viele Krankheiten nicht allein durch die Krankheitsgeister hervorgerufen werden. Wenn jemand etwas Schlechtes ißt, dann wird er davon krank, und man gibt ihm Medizin zum Erbrechen. Wenn jemand durch einen Schuß verwundet wird, dann behandelt man die Wunde. Hat der Verletzte nur in der Wunde Schmerzen, fühlt sich sonst aber wohl, dann ist kein Krankheitsgeist in ihn gefahren. Fühlt er sich jedoch im ganzen krank, dann ist er von einem Krankheitsgeist besessen. Diese Krankheitsgeisterchen heißen Dsao, es sind kleine gelbe Männchen mit dickem Bauche und Schwänzchen. Sie gehorchen den übrigen Geistern. Von diesen gibt es, wie oben geschildert, die gewöhnlichen, die dem Körper der verstorbenen Menschen entstammen, die Geister, welche bei den Sternen wohnen, und den Obergeist (/Nawa) selbst.

Fig. 28. Buschmannrevolver der IKung. (Fexhof; n. Cr.)

Schließlich kann auch der „große Kapitän" die Dsao unmittelbar über einen Menschen senden. /Nawa kann dies tun mit oder ohne Zustimmung des „großen Kapitäns", die kleineren Geister eigenmächtig oder auf Befehl dieser Mächte.

Nun haben die Doktoren ihre übernatürliche Kraft unmittelbar vom „großen Kapitän", sie sind gleich stark wie /Nawa und stärker als die kleineren Geister. Ihre Behandlung ist dementsprechend erfolgreich oder erfolglos. Die Doktoren sind also auf alle Fälle gerechtfertigt.

Die Krankenbehandlung geht demnach zwei parallele Wege, einen mit natürlichen Mitteln (Medizinen und dergleichen), der sich gegen die lokalen Krankheitssymptome wendet, und einen mit übernatürlichen Mitteln, der gegen die Dsao gerichtet ist, die das Krankheitsgefühl hervorrufen.

Bei der Doktorenprüfung wird folgendes Lied gesungen:

e hehehe na ti //kau /goa dsao

Während der Behandlung selbst wird folgender Text gesungen:

/o ma ga //goa ǂam /nai tha

Er hat noch keine Medizin, er soll geworfen werden mit der Medizin.

v. Zastrow und Vedder[1] wissen über die Zauberdoktoren folgendes zu berichten:

[1] Die Buschmänner, l. c., S. 424.

„Der Zauberer kann sich vor den bösen Geistern der bösen Verstorbenen schützen. Er sieht sie ja und kennt die Mittel, um sich ihrer zu erwehren. Der gewöhnliche Buschmann aber hat keine Augen für sie. Er hat aber ein Mittel, um sie sich vom Leibe zu halten. In einem kleinen, fingerlangen Lederröchchen bewahrt er einen aus Horn geschnitzten Bogen mit zahlreichen Hornpfeilen auf, die in einem Schaft aus Sauergras stecken. Befällt ihn die Furcht vor bösen Geistern, so schießt er diese Miniaturpfeile mit seinem Miniaturbogen nach allen Himmelsrichtungen um sich herum ab. Nun können die bösen Geister nicht an ihn herankommen.

Da er außerdem noch den Glauben hat, daß ein auch nur in der Richtung auf eine gehaßte Person geworfener Gegenstand dieser in geheimnisvoller Weise in den Leib fährt und sie schwer schädigt, so gebraucht er ebenfalls seinen Miniaturbogen, um sich einen Verfolger oder Feind vom Halse zu halten, indem er mit einer Verwünschung einen Pfeil in die Richtung abschießt, wo er seinen Feind wähnt, auch wenn er diesen meilenweit von sich entfernt weiß."

Während ich und der sehr erfahrene J. Lankenbein diese Buschmannrevolver für harmlose Zauberinstrumente ansehen, ist Seiner anderer Meinung:

„Der ‚Revolver' ist ein ausgesprochenes Mordwaffenerdinstrument, das in der Schamschürze verborgen getragen wird. Der Bogen ist 10 cm lang, die Pfeile haben eine Länge von 10–12 cm und stecken nebst ersterem in einem mit Perlen verzierten Beutelchen. Dazu ist noch zu bemerken, daß die mit Schnenbändchen über Kreuz umwickelten Pfeile mit aufgeschmierten Körperteilchen der Pfeilgiftraupe vergiftet sind. Der Buschmann zerdrückt gewöhnlich einige der nur im Dezember und Januar erhältlichen, auf einigen Commiphora-Sträuchern (Commiphora Dinteri, C. Seineri) lebenden oder bereits an den Wurzeln unter der Erde verpuppten Raupen mit einem der stets in den Köchern befindlichen Holzstäbchen in einer Knochenschale, beschmiert den Pfeil dann mit einem klebrigen Stoff wie Wachs oder Harz, worauf er den Pfeil mit der zähen, schleimigen Raupenmasse überstreicht, die nach dem Trocknen als mehr oder minder dicke braune Kruste den Pfeil überzieht. Bis auf 7 m Entfernung ist es möglich, mit diesem Miniaturpfeil die Haut blutig zu ritzen; wäre das aufschlagende Pfeilende nicht stumpf, sondern spitz wie jenes, das im Grasschafte sitzt, so würde der Pfeil in das Fleisch selbst eindringen und in die Wunde viel mehr Gift einführen. Die Buschleute suchen sich gegen diese hinterlistige, aber anscheinend häufig angewandte Waffe zu schützen, indem sie sich gegen die Giftwirkung zu immunisieren suchen; sie bringen sich nämlich während einer Zeit von drei bis vier Wochen am Scheitel kleine Schnittwunden bei, die sie die ganze Zeit hindurch offenhalten, um in die Wunden in steigendem Grade Giftlarven zu verreiben. Die Folge sind angeblich Krankheitserscheinungen mehr oder minder schwerer Natur, mit Fieber und Übelkeiten."

DIE ALRAUNWURZEL[1]

Sie stammt von einem kleinen Busch (/gui-ea). Im Gebiete der von mir besuchten Buschmänner kommt sie nicht vor, sondern weiter im Norden. Man findet sie nur zufällig. Wenn der Doktor durch den Busch wandert, dann hört er manchmal leise sprechen. Er sieht bald eine Spur, die derjenigen einer Schlange gleicht und Blutspuren zeigt. Auf dieser Spur geht aufrecht wie ein Stock diese Wurzel. Er darf sie nicht angreifen, weil er sonst gleich sterben müßte, und sucht in die Wegrichtung der Zauberwurzel zu kommen, macht seinen Medizinbeutel auf und läßt das Alräunchen hineinlaufen. Dann wird der Beutel gut zugemacht und daheim auf einen hohen Baum gehangen. In die Hütte darf das Alräunchen nicht hereingebracht werden. Es tropft wie Blut aus der Tasche heraus. Früh am nächsten Morgen wird ein großes Feuer angemacht, Frauen und Kinder und alle kommen zusammen, jeder nimmt sein kleines Bockshorn mit und bekommt vom Doktor etwas von der vom Alräunchen stammenden Medizin. Die Medizin wird in die Haut eingerieben. Buschmänner, die bei den Weißen wohnen, dürfen diese Medizin nicht nehmen, weil sie davon krank werden. – Die Medizin bzw. der Zauber, der von dem Alräunchen ausgeht, hat geringe Wirkung bei denen, die auf die vorbeschriebene Weise be-

[1] Vgl. hierzu: Hanns Bächtold-Stäubli, Handwörterbuch des Deutschen Aberglaubens, Bd. I. Die Hauptquelle für den mittelalterlichen Aberglauben ist eine Stelle aus der Geschichte des Jüdischen Krieges von Flavius Josephus (geb. 37 n. Chr.). Er schreibt (Bellum judaicum VII, 6, 3; Werke übers. von Cotta und Gförer, Philadelphia 1838, S. 762): „Das Tal, welches die Stadt Machärus auf der Nordseite einschließt, heißt Baara und erzeugt eine Wurzel gleichen Namens. Sie ist flammend rot und wirft des Abends rote Strahlen aus; sie auszureißen ist sehr schwer, denn dem Nahenden entzieht sie sich und hält nur dann still, wenn man Urin und Blutfluß (Menstrualblut) darauffließt. Auch dann ist bei jeder Berührung der Tod gewiß, es trage denn einer die ganze Wurzel in der Tasche davon. Doch bekommt man sie auf andere Weise, und zwar so: Man umgräbt sie rings so, daß nur noch ein kleiner Rest der Wurzel unsichtbar ist; dann bindet man einen Hund daran, und wenn dieser dem Anbinder schnell folgen will, so reißt er die Wurzel aus, stirbt aber auf der Stelle als ein stellvertretendes Opfer dessen, der die Pflanze nehmen will. Hat man sie einmal, so ist keine Gefahr mehr. Man gibt sich aber soviel Mühe um sie wegen folgender Eigenschaften: Die Dämonen, d. h. böse Geister schlechter Menschen, welche in die Lebenden hineinfahren und sie töten, wenn nicht schnell Hilfe geleistet wird, werden von dieser Pflanze ausgetrieben, sobald man sie dem Kranken auch nur nahebringt."

handelt wurden, aber schwere Wirkungen bei den andern. Darum wird diese Medizin auch dann verwendet, um durch Fernwirker Feinde zu töten. Geht der Dokter zu einer Herde, die diese Medizin noch nicht hat, dann trägt er das Horn mit ihr um den Hals. Wer ihn ansieht, in den geht etwas von dem Zaubergift des Aktäuchens ein.

Setzt sich der Dokter nieder, dann fällt derjenige, der ihn gesehen hat, wie tot um und stirbt, wenn ihm nicht geholfen wird. Handelt es sich um Feinde, dann geht eben der Dokter wieder fort und kümmert sich nicht weiter. Dem Bewußtlosen schwillt der Bauch gewaltig an. Sind alle Prozeduren vergeblich geblieben und erinnert man sich, daß dieser oder jener Dokter die Zaubermedizin hat, dann ruft man ihn, er nimmt aus seinem Horn etwas von seiner blutähnlichen Flüssigkeit heraus, schmiert sich zuerst die eigenen Füße ein und reibt dann die Füße des Kranken und vor allem dessen Bauch in drehender Massage. Allmählich tritt die Schwellung zurück, der Kranke steht auf, setzt sich hin und ist gesund.

Diese Geschichte, die auf der Tatsache, daß es Wurzeln gibt, die einen blutähnlichen Saft haben, basiert, ist in unklarer Weise auch zur Kenntnis der Farmer gelangt und war die Ursache der lächerlichen Angst, die viele Farmer vor den geheimen Giften der Buschmänner haben.

15. DIE ELEMENTE

Himmel und Erde, Sonne und Mond, alles hat χ'u, der große Kapitän, das höchste Wesen, gemacht. In den sonnendurchglühten Wüsten, die die Buschmänner bewohnen, ist die Sonne keine Gnadenspenderin, wird es doch in der heißen Zeit so warm, daß auch der Buschmann tagsüber im Schatten bleibt, weil der Sand so heiß ist, daß man darüber nicht laufen kann.

Die Sonne war eine Menschentochter. Die Buschmänner hatten sie gesehen, und die Männer mußten diese Tochter tragen, aber da sie auf der Schulter heiß brannte, so mußten die Männer oft wechseln. Als aber die Schultern aller Männer verbrannt waren, da ließen sie die Sonne im Busch liegen und brachten sie nicht bis zu den Hütten. An dieser Stelle ist die Sonne aufgegangen. Sie ist vom großen Kapitän.

Wenn die Sonne untergeht, dann setzt sie sich auf die Erde, um zu essen. Wenn es Tag werden soll, dann geht ein Schulterblatt von ihr auf die andere Seite der Welt, wo es als Sonne herauskommt. Die Sonnenstrahlen (/gam †hâse) sind die Arme der Sonne. Die Sonnenfinsternis (†Kâe) machen die Löwen, damit sie die Menschen leichter fressen können.

Fröhlich wird auch der Buschmann erst, wenn die Abendkühle kommt, und in den Zeiten des Vollmondes feiert er seine Feste. Aber von Mondanbetung ist bei den von mir besuchten !Kung-Buschleuten keine Rede.

Vom Mond wurde mir erzählt: „Den Mond haben die Leute auch getragen. Er war nicht so warm wie die Sonne, aber sehr schwer. So haben sich die Männer geholfen und ihn mit großer Mühe zu den Hütten gebracht. Der Mond war ein Mann, er sagte: ‚Ich bleibe lieber allein und mag nicht bei euch sein.' Da sagten die Buschmänner: ‚Wenn du allein in die Wüste gehst, mußt du sterben.' Aber der Mond folgte nicht, ging hinaus und ist gestorben. Dann ist er aber wieder aufgewacht und wie die Sonne aufgegangen, darum ist er wie diese vom ‚Großen Kapitän'. Wenn er verschwindet, dann ist er gestorben. Wenn nur eine Seite von ihm zu sehen ist, dann ist er jung. Wenn er kleiner wird, dann ist er alt. Die Farbe des Mondes stammt von seiner Galle (/gâe)."

Die bekannte Geschichte vom Mond und vom Hasen wird dort auf folgende Weise erzählt:

Der Mond sagte einmal zum Hasen: „Ich sterbe und wache wieder auf, ihr auf der Erde sollt dasselbe tun." Der Hase aber antwortete: „Nein, das können wir nicht, die wir auf der Erde sind, das kannst nur du, weil du in der Luft bist, bei uns geht das nicht; wenn wir einmal sterben, so wachen wir nicht mehr auf." Und der Hase hat recht behalten, es ist bis heute so.

Die Mondesfinsternis !nui dase wird von den Löwen gemacht, damit sie leichter in die Buschmannhütten schleichen können.

Kometen, χ'u lgam, sind Sterne des großen Kapitäns, sie bringen Glück. Wenn eine Sternschnuppe, †gomma, fällt, dann sagt man, genau so wie bei uns, es stirbt jemand. Die Sterne nämlich sind die Lagerfeuer jener Geister, die auf Befehl des großen Kapitäns herabkommen und die Seelen der Sterbenden holen.

Erdbeben, χ'ãno lgwe, kündigen Krankheiten an. Der Regenbogen, !Khãsi lnõo, kündigt ein gutes Regenjahr an.

Was der Buschmann erfleht und erbittet, ist nicht Sonnenschein, sondern Regen. Über den Regen gebietet der große Kapitän allein.

Blitz und Donner sind keine eigenen Wesen, sondern die macht der Regen. Wenn jemand vom Blitz erschlagen wird, dann sagt man: „Der Regen hat ihn getötet." Wenn es in der Ferne blitzt und donnert, dann sagt der Regen: „Heute werde ich donnern auf der ganzen Erde." Wenn es auf verschiedenen Seiten blitzt und donnert, dann sprechen die Wolken miteinander. Und wenn sie mit ihren Köpfen sich berühren, dann kommt der Regen herunter, und die Wolken breiten sich über die ganze Welt aus. Der Regen, der auf die Erde heruntergekommen ist, bleibt nicht da, die Wolken kommen wieder aus der Erde heraus. Der Regen gehorcht dem großen Kapitän. Im Sturm reißt der große Kapitän die Bäume um. Aber wenn ein Mensch etwas Schlechtes gegen ihn sagt, dann bleibt die Strafe nicht aus. Denn χ'u sagt zum Regen: „Du selbst jetzt gehen und ihn töten." Und der Regen geht hin und tötet den Mann mit dem Blitz. Wenn aber der große Kapitän zum Regen sagt: „Du selbst jetzt gehen und ihn strafen", dann schlägt der Blitz bloß in den Windschirm ein, daß alles zusammenbricht und der Übeltäter herausgeworfen wird. Dann laufen die Leute hinzu, reiben den Bewußtlosen mit Medizin ein und brennen ihm mit glühenden Hölzchen die Haut, bis er wieder zu sich kommt.

So läßt der erzürnte große Kapitän strafen.

Der betroffene Buschmann ist nun aber weit entfernt, den großen Kapitän etwa im stillen oder öffentlich um Verzeihung zu bitten, er ist überzeugt, daß das nichts nützen würde. Er vertraut sich dagegen dem folgenden Verfahren an: Es ist bekannt, daß dort, wo der Blitz in Quarzsand fährt, die sogenannten Blitzröhren oder Fulgurite entstehen. Diese Tatsache ist auch dem scharfen Auge der Buschmänner nicht verborgen geblieben. Meine Freunde erzählten: Dort, wo der Blitz eingeschlagen hat, findet man gewöhnlich einen Stein, „Regenzahn" genannt. Mit diesem Stein ritzt sich der vom Blitz Gestreifte die Haut, reibt Medizin ein, die Jagdglück bringen soll, und sucht einen Gemsbock zu erjagen. Ist ihm das gelungen, dann kocht er Fleisch von dem Bock zusammen mit dem Regenzahn. Ist noch ein zweiter bei der Horde, der vom Blitz schon einmal gestreift wurde, dann muß dieser mit ihm zusammen das Fleisch essen. Dann wird Medizin gemacht aus diesem Fleisch und anderen Ingredienzien, und diese wird in das Horn eines kleinen Buschböckchens gegeben und von dem Betroffenen um den Hals getragen.

Wenn der „Regen" nun noch einmal kommt, dann geht er wieder zu der Hütte des Betroffenen, geht durch das Feuer, wo der Bock gekocht wurde, hindurch und reißt einen Knochen des Bockes (diese Knochen bleiben an Ort und Stelle liegen) mit sich und fährt mit ihm in den nächsten Baum. Der Knochen kocht in dem Baum, der Schaum kommt auf der Seite heraus und unten das Fett. Ist der Regen vorüber, dann wird der Knochen wieder herausgezogen und mit Gemsbockhorn und Duikerhorn und Fleisch eingekocht, verkohlt und zu einer Medizin verrieben. Dem Betroffenen werden nun Einschnitte auf der Zunge, der Stirn, den Wangen, der Brust und den Beinen gemacht, mit Fett eingerieben und diese Medizin hineingeschmiert. Nun ist er bis auf weiteres vor der Verfolgung durch den Regen sicher.

16. DER REGENZAUBER

Unmittelbar wendet man sich an den großen Kapitän, wenn man Regen braucht. Nicht alle Doktoren können den Regen herbeischaffen, nur einige wenige, die sich der besonderen Gunst des großen Kapitäns erfreuen. Dann wird ein Tanz veranstaltet, bei welchem sich die Doktoren in den unten geschilderten Trancezustand versetzen. Dazu wird der folgende Klagegesang unzählige Male wiederholt:

!gará guri dao oá †am	Warum regnet es nicht?
χ'uá dé ré /gaa !ái /gaa	Welcher Herr hält den Regen fest?
/gám khui hõ	Die Sonne ist heiß.
!hûng-uá guri /gõá /gõá	Wird der Mensch leben?
//gaudna tani /gao †gáo	Bringen die Geister den Winter?
!kung /goá hõõ !koá !kung ó dohn-ã	Wo soll der Mensch trinken?
//gaa /a //gõõ !kung /ã a //gõõ	Wenn es so ist, kann der Mensch nur verdursten!
!kunã //gõõ ao oa	Was kann der Mensch nun machen?
Ha-!kung tam hã m tam uá /ã gõõ	Wir bleiben besser hier, weil wir verlassen sind!

Schließlich hört der große Kapitän im Himmel den Jammer. Der Doktor läuft vom Tanzplatz weg in den Busch und sieht, wie ein dünner Faden vom Himmel herabgelassen wird. An diesem Faden klettert der Doktor hinauf. Der große Kapitän aber kommt ihm auf halbem Wege entgegen. Sobald der Doktor den großen Kapitän sieht, wirft er ihm ein rotes Pulver (Ocker mit Medizin) entgegen. Nun sieht der große Kapitän den Doktor hoch und führt ihn zum Himmelshaus. Vor demselben sieht

Fig. 20. Totengeister und Regentier (ex Bleek, Rock Paintings in South Africa etc., Tafel 16)

der Doktor die Geister seiner verstorbenen Kollegen, die jahraus, jahrein vor dem Hause stehen. Der Doktor fängt dann zu bitten an: „Herr, hilf uns, die Kinder sterben, wir verdursten und verhungern." Er bittet und bettelt so lange, bis der Kapitän sagt: „Es ist gut, ich werde Wasser schicken, damit die Kinder Wasser und Feldkost haben." Dann begleitet der große Kapitän wieder den Doktor bis zur Hälfte des Weges. Sobald der Doktor unten ist, läßt er den Faden los, welcher sogleich hochgezogen wird. Nun tanzen die Leute und singen; denn der Regen ist gekommen:

†gá-é dsõ-jã /gaa	Wir freuen uns jetzt über den Regen.
//ã gã djusã !ho ãdehõja /ga	Dann freuen wir uns alle zusammen.
//ã gã hin a /gaa /gaa	Dann kommt der Regen.
da //goá dohn !gu da adechõõa χ'ã	Dann loben die Leute den Herrn.

Ein anderer !Kung sagte mir: „Der große Kapitän im Himmel schickt den Regen und alles, was von oben kommt. Wenn er nicht will, bleibt alles zu. Der Regen wird oben aufgemacht, dort ist ein großes Vlej. Den Namen des großen Kapitäns kenne ich nicht. Die Hei//om nennen ihn Som-seb."

12. RELIGION

Überblickt man kritisch die Summe der Vorstellungen, welche das religiöse Leben der !Kung bestimmen, so erkennt man, daß, wie es bei einem so alten Volke ja nicht anders zu erwarten ist, die Elemente verschiedener Religionen Eingang gefunden haben. Allen Buschmannstämmen, die ich besucht habe, ist der Glaube an ein höchstes gutes Wesen gemeinsam, dessen Namen variiert. Die hier Beschrie-

bosen nennen das höchste Wesen χ'u, „den Herrn" oder „den großen Kapitän"[1]. Es ist derselbe Ausdruck, den die Kaphottentotten mit der gleichen Bedeutung und Aussprache 705 dem deutschen Reisenden Kolbe gegen über gebrauchten[2]. Von den umliegendenHoi//om-Stämmen kann der Name

[1] Nach Vedder ist (Tsumeb) Huwe das höchste Wesen. Wenn die ersten Feldfrüchte reifen, wird vor Sonnenaufgang ein Opfer dargebracht. In ein durchbohrtes Hals wird ein frisch gebrochener Zweig hineingesteckt. Die Leute sitzen im Kreis herum, und der älteste reicht eine aus einem Röhrenknochen gefertigte Tabak- oder Dachspfeife herum.

[2] Auf meine diesbezüglichen Beobachtungen ist J. Schapera (The Khoisan peoples of South Africa, 1930) kritisch zurückgekommen. Ich habe hierzu zu bemerken: Der „große Kapitän" bei den Ost-Kung kann mit Recht als „höchstes Wesen" bezeichnet werden. Seine Charakteristika habe ich bereits in meinen früheren Veröffentlichungen gegeben.

Die Schreibung lautet richtig χ'u. Mit χ' bezeichne ich einen Kika, der noch tiefer angesetzt ist als „!". Er findet sich auch in anderen Worten wie etwa χ'Ame = Löwe. Da nicht alle Redaktionen über die entsprechende Letter verfügen, habe ich manchmal auch Khu oder Chu schreiben müssen. Dieses Wort, das auch die !Kung mit „Herr" oder „großer Kapitän" übersetzen, findet sich bereits, wie Schapera anführt, 1705 als Khourou — „Supreme Ruler" und „Great Chief" oder „Großer Kapitän" bei den Kap-Hottentotten; ein ganz analoges Zitat bringt Kolbe wenig später und Hahn berichtet von einem alten Nama „The people say, if it is thundering, the Lord (Khub, i. e. Tsui//Goab) is speaking; he is scolding them", Schapera, l. c., S. 381.

Der Glaube an einen großen Kapitän ist also den !Kungbuschmännern und den Kap-Hottentotten gemeinsam gewesen, und das hohe Alter der Nachrichten vom Kap schließt es aus, daß hier ein missionarischer Einfluß wirksam war. Ebenso wie bei den !Kung ist auch bei den Naron der Mißbrauch dieser Glaube offenbar uralt, und nicht erst von den christlichen Hottentotten übernommen. Im Ovambolande verschwimmt der Begriff χ'u mit Huwe, und ich glaube, daß auch J. Schapera Huwe, Chuwe und χ'u für identisch hält. Daß die Ostkung den Glauben an ein höchstes Wesen haben, habe nicht ich entdeckt, sondern diese Entdeckung hat schon 1910 H. Vedder gemacht.

Es muß jedermann auffallen, daß zwischen den Berichten, die ich bei den Ostkung vom Himmelsheim aufgenommen habe und den Daten, die H. Vedder von dem /Gamab der Hottentotten der Otavibergbaubringt, eine weitgehende Übereinstimmung besteht. Auch örtlich liegen diese Gebiete ja auch nahe beieinander. Es fragt sich nun, haben die !Kung diese Lehre von den Hottentotten übernommen, was Schapera anzunehmen scheint, oder ist das Umgekehrte der Fall. Bei den Bergdama des Mittellandes, wo ich umfangreiche Studien, speziell im Reservat von Okombahe vornehmen konnte, ist von diesen Anschauungen der Hottentotten kaum etwas vorhanden. Die Bergdama sind ein Negervolkstamm, der seine ursprüngliche Kultur und Sprache vollkommen eingebüßt hat und der sich durch lange Zeit in einem Abhängigkeitsverhältnisse zu den Buschmännern befand, deren zum Teil recht stämmerhafte Nachkommen sie geworden sind. Noch heute gehen von Windhuk und Okombahe Bergdama, die Zauberdoktoren werden wollen, zu den !Kung, um dort zu lernen. Wären die von H. Vedder berichteten Auffassungen der Hottentotten urnegerisches Kulturgut, dann müßten sich doch Parallelen finden lassen, und dann wäre doch zu erwarten, daß sich zumindest in den Namen, die sich auf das Jenseits beziehen, Spuren der alten Sprache finden. Fast durchwegs liegt bei den Bantu die Welt des Jenseits unter der Erde, bei den Khoisan aber am Himmel. Aus allen diesen Gründen ziehe ich den Schluß, daß die Hottentotten die Lehre von /Gamab von den !Kung übernommen haben. Der Ausdruck Erub oder Elder, der sich bei manchen Buschmannstämmen findet, geht zweifellos auf christlich-hottentottischen Einfluß zurück. Die Doppelnamigkeit des höchsten Wesens aber bei verschiedenen Gruppen im Ovambolande läßt darauf schließen, daß hier doch nur ein neuer Name für eine altbekannte Vorstellung Eingang fand, und zwar mit solcher Intensität, daß z. B. die Hoi//om an der Etoshapfanne ihre wichtigste Heilwurzel Erubwurzel nennen. Übrigens ist es ebenso wie bei den Hottentotten bei den Hoi//om der Etoshapfanne-/Gamab, der Donner und Blitz schickt und der die Menschen durch Sternschnuppen tötet. J. Schapera kommt zu der Erkenntnis, daß die Vorstellung von Huwe, Thora und der Mantis als Schöpfer, als Spender des Regens und des Erfolges in der Jagd und als Beschützer der Menschen allen Buschmännern gemeinsam ist (l. c., S. 195) und auch bei den Hottentotten ihr Analogon hat. Doch scheint er dieses Wesen eher als einen Regengott anzusehen. Ihm steht als Gegenspieler, der den Menschen Böses tut, unter schwankendem Namen //Gaua gegenüber. Schapera meint, daß die ursprüngliche Bezeichnung //Gaua für die Geister der Toten galt. Dies ist zu einem guten Teile richtig. Meine an verschiedenen Orten gepflogenen Erhebungen ergaben aber, daß unter //Gaua alle möglichen, nichtkörperlichen Wesen verstanden werden, also Geister in unserem Sinne und immaterielle Kräfte aller Art. Der große Kapitän wird ja bei den !Kung im Grunde genommen körperlich gedacht. P. W. Schmidt hat nun aber diesen //Gaua als ursprünglichen Himmelsgott angesehen. Hierfür mögen vergleichende religionsgeschichtliche Tatsachen sprechen.

Wenn ich Schapera recht verstehe, so sind wir uns darüber einig, daß bei den Buschmännern ein guter Hochgott tatsächlich vorhanden ist, den er aber nicht als höchstes Wesen bezeichnen möchte. Ich halte aber daran fest, daß dieses Wesen nach dem gemeinen Sprachgebrauche so bezeichnet werden muß. Die Völker der Khoisangruppe haben nach dem Ausweise der prähistorischen Funde eine bewegte Geschichte hinter sich, in ihnen leben die verschiedensten Rassen fort, ihre Kultur ist in optimaler Anpassung an die Daseinsbedingungen als eine Restkultur

nicht stammen, denn diese gebrauchen hierfür das Wort Somsch. Eher wäre an Huwe zu denken. Huwe oder Hue nannten die !Kungbuschleute von Tsumeb, die Vedder untersuchte, das höchste Wesen. Von Buschleuten aus Ukuambi kenne ich auch den Ausdruck Chuwa. Dieses höchste Wesen wird menschlich gedacht, es sieht aus wie ein Buschmann und spricht auch Kung. Er wohnt im Himmel in einem Hause, das zwei Etagen hat, in der unteren Etage wohnt seine Frau, deren Namen unbekannt ist, ferner viele Kinder. In der oberen Etage wohnen die Seelen der Verstorbenen. „Das Haus" (es soll ähnlich, aber nicht ganz so wie ein Buschmannwindschirm sein) „ist außen haarig wie eine Raupe." Es gibt vielerlei dort oben, aber nur ein einziges Haus, nämlich das des Kapitäns. Honig, Heuschrecken und dicke Fliegen gibt es in Überfluß. Davon nährt sich der große Kapitän. Außerdem gibt es eine Menge Schmetterlinge. Als Funktionen dieses höchsten Wesens werden angesehen:

1. Nach der Meinung der einen hat der große Kapitän Sonne, Mond und alles gemacht. Nach der Meinung anderer hat der oberste der Geister /Nawa dies getan.

2. Der große Kapitän beruft die Doktoren zu ihrem Beruf und gibt ihnen übernatürliche Kraft.

3. Er ist der Herr über den Regen und über den Blitz.

4. Er schickt durch den obersten der Geister das Glück auf der Jagd oder beim Feldkostsuchen.

5. Wenn jemand schlecht über ihn denkt oder spricht, den straft er mit dem Blitze. Um das sonstige Tun und Lassen seiner Buschmannkinder kümmert er sich jedoch nicht. Es sei denn, daß jemand falsch schwört. Die Kung haben einen regelrechten Eid, und einer meiner Gewährsleute berichtete mir wie folgt:

Wenn eine Gruppe zur Jagd geht und einer von den Teilnehmern während der ganzen Dauer der Jagd nicht gesehen wird, so gerät er in Verdacht, sich verdrückt zu haben. Dann schwört er beim großen Kapitän nu'zu, und dann glauben ihm alle.

Für gewöhnlich läßt jedoch der große Kapitän alles durch den obersten der Geister und kleinere Geister besorgen. Die Hauptsorge der Buschleute ist es also, sich mit diesen Geistern gut zu stellen, doch bietet der große Kapitän Schutz gegen alle bösen Geister, und darum wendet man sich auch an ihn bei schwerer Krankheit und vor Antritt einer Reise mit folgenden Gebeten:

---

anzusehen, und es ist darum selbstverständlich, daß ihre Weltanschauung synkretischen Charakter hat, zumal ja die religiösen Ideen Kulturelemente mit ausgesprochen diffuser Verbreitungstendenz sind. Wie alle Menschen haben auch die Buschmänner mit den anderen Primitiven ein im Grunde gleichartiges Denken mit uns. Auch der Buschmann hat ein ausgesprochenes Kausalbedürfnis. Dieses drängt jedoch weniger auf eine kausale oder konditionelle Begründung der gegebenen Zustände, wie auf die der Vorgänge. Daher werden wir bei den Primitiven seltener klar durchdachte Vorstellungen über den Ursprung der Welt der Tiere, Menschen und Pflanzen finden, als eine klare Beantwortung der Frage nach dem Verursacher der aktuellen Vorgänge, d. i. des Regens, des Gewitters, der Krankheit, des Todes, überhaupt von Unglück und Glück im menschlichen Leben. Dieser Verursacher ist entweder ein menschenähnlich gedachtes Wesen über den Wolken oder es sind die Ahnengeister. An diesen beiden Anschauungen orientiert sich im allgemeinen auch das religiöse Bedürfnis oder das Schutzbedürfnis. Eine je größere Bedeutung den guten Ahnengeistern und ihrer Beeinflußbarkeit durch magische Praktiken zukommt, eine um so geringere Bedeutung hat das als generelle Causa efficiens gedachte Himmelswesen. J. Schapera wird mir zweifelsohne zustimmen, wenn ich sage, daß im Gegensatz zu den Bantu das Kausalbedürfnis und das religiöse Schutzbedürfnis an Thora, Huwe, /Gamab u. a. orientiert ist und dieses Himmelswesen also bei den Buschmännern jene Rolle spielt, die wir einem „guten höchsten Wesen" zuschreiben. Zur Kritik der Anschauungen der Buschmänner sei hervorgehoben, daß die Buschmänner wie alle Primitiven ihre religiösen Vorstellungen nur soweit systematisieren, als dies zur Befriedigung ihres religiösen und Kausalbedürfnisses notwendig ist. Wir werden also eine von Gruppe zu Gruppe, ja von Individuum zu Individuum verschiedene Geschlossenheit des Weltbildes antreffen, und ein voll durchgebildetes System der Buschmannreligion wird kein Forscher entdecken können, weil ein solches nicht vorhanden ist. Was ich bei meinen einzelnen Gewährsmännern aufzeichnen konnte, habe ich mit der Exaktheit eines geschulten Naturforschers wahrheitsgetreu unter Berücksichtigung aller Kontrolle aufgezeichnet. Aus diesen Aufzeichnungen habe ich den zwingenden Schluß gezogen, daß ein gutes höchstes Wesen in ihrem Weltbilde real ist.

χ'u, χ'u hči mi, //kai tsao mi
toχ'obe ǂhu !gaise ǂ'ani u mi /nāna /ge a
!nore gana ti /ge a gana ti tse /Nane /ā mi tsu[1]

Herr, Herr hilf mir, habe mich.
„Der Herr soll mich gut führen nach dem Platze,
wo ich hingehe, und er soll mich gut zurückführen,
daß ich gesund nach Hause komme."

Vor der Jagd beten die Doktoren zum großen Kapitän um Jagdglück. Es ist schon kein Zweifel, daß sich die Buschmänner unter diesem „großen Kapitän" ein allmächtiges und zugleich gütiges Wesen vorstellen. Sein Exekutivorgan ist, wie schon bemerkt, der oberste der Gauabe. Dieser wird von den gewöhnlichen Leuten „der Gauab" genannt. Er hat aber einen Namen, den nur die Doktoren wissen und dessen Aussprechen üble Folgen haben kann. Da ich schließlich die Ehre hatte, von den Doktoren als ihresgleichen angesehen zu werden, so erfuhr ich ihn auch. Er heißt: /Nawa. Eine Deutung dieses Wortes konnte mir nicht gegeben werden. Nun bringt aber Miß Bleek aus Tanzliedern der Angola-Kung das Wort: /Nwa-se, das eine Abkürzung für Nwima-se = Neumond sein soll. Darnach könnten wir in diesem Obergauab vielleicht den Hochgott einer mondmythologischen Religion sehen, die sich als ein fremdes Element über den primitiven Monotheismus des χ'u- oder Huweglaubens gelegt hat. Wie in solchen Fällen immer, ist das höchste Wesen der eingedrungenen Religion in ein mehr oder weniger böses Prinzip verwandelt worden. Als solches fungiert es auch im Glauben der Nama und Dama, und aus diesem Ideenkreise stammte die Übersetzung des Gauab mit Teufel. Ein getaufter !Kung in /Nuiseb sagte mir auch, die Buschmänner hätte der Teufel gemacht, denn dieser habe, wie mir alte Doktoren berichteten, einmal zu den Dingen gesagt: „Du wirst ein Kudu, du ein Eland, du ein Buschmann" usw. und so ist alles geworden. Bei den !Kung-Buschleuten ist /Nawa keineswegs immer böse. Er bringt unmittelbar das Glück auf der Jagd, und ihm wird auch eine Art Primitialopfer dargebracht, indem kleine Stücke vom Fleische der Jagdbeute ins Feuer geworfen werden.

/Nawa schickt aber auch gewöhnlich die Krankheiten, teils mit, teils ohne Zustimmung des großen Kapitäns. /Nawa ist weder im Himmel noch auf der Erde, sondern er läuft auf Fäden in der Luft umher, wo auch die anderen kleinen Geister herumlaufen. Ob /Nawa eine Frau hat, ist nicht bekannt. Im hohen Buschwald spielt der Wind keine Rolle, aber meine Erfahrungen bei den Buschleuten der West-Kalahari und der Namib zeigen, daß /Nawa auch irgendwie mit dem Wind zusammengebracht wird, denn in den gewaltigen Windhosen tritt er höchstpersönlich in Erscheinung, und bei den Naukluft-Buschleuten soll man nicht schlecht über den Wind sprechen, weil sonst der Gauab den Windschirm umwirft.

Außer /Nawa gibt es noch ein Heer von anderen kleinen Geistern, und zwar a) solche, die zur Verfügung des großen Kapitäns und /Nawas stehen und am Himmel sitzen, wo die Sterne ihre Lagerfeuer sind. Sie sind es, die dem Menschen die Seele rauben und zum großen Kapitän bringen. Dann gibt es noch welche, die wie /Nawa auf Fäden, die zwischen Himmel und Erde gespannt sind, hin- und herlaufen. Ganz böse Geisterchen hausen im Wasser, und Wald und Flur sind von den kleinen Gauabe bevölkert. Diese sind aber nichts anderes als wie die fleischgeborenen Geister der verstorbenen Menschen. Damit kommen wir zu

18. SEELENLEHRE UND UNSTERBLICHKEITSGLAUBEN

Das Lebensprinzip des Menschen ist die Seele Cha. Dasselbe Wort bedeutet auch Herz. Diese Cha ist unsterblich, die Gauab, die bei den Sternen wohnen, bringen es zum Haus des großen Kapitäns. Dort wohnen in der zweiten Etage die Seelen aller Völker, sogar die der Weißen. Sie machen nichts und essen auch nichts. Bei anderen Buschmannstämmen, die ich besuchte, verwendet der große Kapitän diese Cha, um damit neue Menschen zu schaffen. Bei meinen Freunden aus dem Buschfeld ist jedoch das Dolce far niente in der zweiten Etage des Himmelshauses die letzte Bestimmung des Menschen. Dorthin kommen die Seelen aller, der Guten und der Bösen. Eine Vergeltung im Jenseits gibt es nicht.

[1] Niederschrift des Dama-Dolmetschers.

Der Körper aber wird zur Erde bestattet. Nach einigen Tagen wird das Fleisch lebendig und verschwindet dann. Der Gauab des Verstorbenen ist entstanden, kommt aus dem Grabe heraus, geht auf die Jagd, ißt und trinkt und führt als Schatten ein ähnliches Leben wie zu Lebzeiten. Das Grab ist sein Haus, dorthin geht der Schatten[1] schlafen, wenn er müde ist. Diese Geister können aber nicht in Steine, Pflanzen oder Tiere hineinfahren oder sich in solche verwandeln. Von diesem echten Animismus ist keine Spur vorhanden. Der Gauab ist vielmehr eine (um das im Grabe verbleibende Skelett) verkleinerte Ausgabe des einst lebenden Buschmannes. Er sieht ähnlich aus wie ein Buschmann, aber viele von diesen Gauab sind lahm. Sie sind im allgemeinen boshaft, und wenn jemand am Grabe vorbeigeht und sie ärgert, dann schicken sie die Krankheitsgeisterchen, die sie bei Lebzeiten einst selbst getötet haben. Diese Krankheitsgeister werden als kleine gelbe Männchen mit dickem Bauch gedacht.

Wir haben also bei den !Kung-Buschleuten eine ausgesprochene Zwei-Seelenlehre. v. Zastrow und Vedder[2] berichten:

„Die /Oresen sind böse Leute gewesen. Sie sind gestorben, können aber nicht zur Ruhe kommen. Ihre Bosheit läßt sie nicht ruhen. Immer noch wollen sie anderen Schaden zufügen. So haben sie im Leben gehandelt. So wollen sie auch noch nach dem Tode tun. Sie quälen die Menschen, erschrecken sie und suchen sie zu töten. Wenn sie Menschen getötet haben, so essen sie deren Fleisch. Sie kommen in der Nacht. Die Zauberer können die bösen Geister sehen. Die Zauberer warnen dann die anderen, die nichts sehen können. Die /Oresen wohnen in den Gräbern. Von da aus machen sie ihre Rundgänge. Zu ihren Gräbern kehren sie immer wieder zurück. Ein Buschmann geht daher einem Grabe immer aus dem Wege. Er weist auch nicht mit einem ausgestreckten Finger auf ein Grab. Er ruft auch nicht einem Gefährten zu: ‚Dort ist ein Grab!' Man geht in großem Bogen um die Gegend, wo ein Grab ist. Kommt ein Buschmann aber unvermutet an einem Grabe vorbei, so nimmt er einen Stein und legt ihn darauf. Das ist ein Gruß für den Toten. Man macht dadurch das Grab noch sicherer vor den wilden Tieren."

Aus der Gegend von Foxhof habe ich noch folgende Informationen nachzutragen:

„Der Gauab, der aus dem Fleisch des Leichnams entsteht, bleibt beim Grabe sitzen. Wenn nun ein Verwandter vorbeikommt und der Gauab sitzt im Freien, so denkt sich der Gauab: den Menschen kenne ich gut, warum geht er hier vorbei und gibt mir kein Wasser, dann wird der Gauab böse und macht ihn krank. Wenn nun die Doktoren singen, so erkennen sie, was los ist und sagen: Du bist heute bei dem Grab des N. vorbeigegangen und hast nichts gegeben. Daher mußt du morgen ganz in der Frühe Wasser nehmen und ein Straußenei damit beim Grabe hinstellen. So ein Gauab geht auch auf die Jagd, tötet ein Wild, macht sich Feuer, schneidet das Wild auf, nimmt Fett und bringt es zu den Doktoren, während sie singen. Der Gauab, den die anderen Leute nicht sehen können, setzt sich in ziemlicher Entfernung von den Tanzenden hin. Der Doktor sieht ihn aber und geht zum Gauab. Der sagt ihm, wo das Wild liegt, und der Doktor erzählt dies den übrigen Leuten, die holen das Wild und loben den Gauab.

Die Sterne sind die Lagerfeuer der Gauab.

Die Seelen, die die Gauana gestohlen haben, bringen sie auf ihre Werft und dann wieder ins Grab zurück. Die Leute hören im Felde oft eine Stimme, dann ruft der Gauab, und während sie gehen, finden sie ein totes Wild. Wenn der Gauab auf der Jagd ist und sich zuweit von seinem Grabhause entfernt hat, so muß er auf einem Baum schlafen. Die von den Gauaba gestohlenen Seelen werden zum Teil zu dem Kapitän der Gauana gebracht. Diese Seelen, die dahin gebracht werden, werden wieder wirkliche Menschen oben beim Kapitän des Regens. Die anderen aber sind die kleinen Gauaba, die hier auf die Jagd gehen."

Von besonderer Bedeutung erscheinen die Aufnahmen, die Bleek[3] vor 50 Jahren gemacht hat. Die !Kung erzählten damals von einem Wesen namens /Chue. Dasselbe verwandelt sich der Reihe nach in verschiedene Fruchtbäume und Feldkostpflanzen, in einen Herero usw. Eines Tages verwandelt es sich in einen //Gui-Baum, seine Frau ißt davon, der Baum verschwindet, und /Chue verwandelt sich in eine Fliege. Ein anderes Mal wird er sogar ein Wasserloch, dann wiederum ein Gecko, bei Nacht

[1] Besser als „Schatten" wäre vielleicht „lebender Leichnam".
[2] Die Buschmänner, l. c., S. 421.
[3] W. H. J. Bleek and L. C. Lloyd, Specimens of Bushmen Folk lore. London 1910–11. S. 10–13.

verwandelt er sich immer wieder in einen kleinen Menschen. Die Herero suchen ihn, können ihn aber nicht finden. /Chue macht dann Feuer und stirbt. Sein Vater sieht dies und sieht dann in seine Helmet, die auf einem großen Berge namens //Noa liegt. Wir werden wohl nicht fehlgehen, wenn wir diesen /Chue mit Huwe identifizieren. Dieser Huwé wird aber dann bekanntermaßen gelegentlich dem großen Kapitän χ'u gleichgesetzt. Er trägt in dieser alten Fassung aber auch deutliche Züge des Heisob.

Die !Kung, welche W. H. J. Bleek zur Verfügung standen, kannten auch einen Bittgesang an den jungen Mond. Dazu bliesen sie auf Trompeten aus Antilopenhörnern. (Bleek-Lloyd, l. c., S. 15.)

Die alten !Kung nannten die Wahrsagehölzer selbst /Chu, was offenbar wieder derselbe Name wie der des großen Kapitäns ist und sich mit der Nachricht Dornans über die Masarwa deckt, daß Modimo selbst aus den Wahrsagehölzern spreche.

Vedder berichtet, daß im Krankheitsfall ein Bote zum Grabe eines Ahnen geschickt wird, der dort betet: A dai-dai mi lhâ ti /χ'ai-a? (Warum mein Sohn ist krank?) ǂnu /hôã (gesund leben).

Während meine Gewährsmänner das Vorhandensein jeglicher animistischer Vorstellung leugneten, glaubten die alten !Kung, daß gewisse Schlangen, Eidechsen und Antilopen, die in der Nähe von Gräbern angetroffen werden, ebenso wie bei den Bantu Totengeister darstellen[1].

19. TANZLIEDER

Einige wenige Tänze konnte ich aufnehmen:

1. Tanzlied bei der Hochzeit

se ga se /nuia khe e /goaro be	Wir singen vom Kinde. (Wiederholt sich.)

2. Pantomimischer Elandtanz

χ'ai /nui !gaa u da !gaa	Läufer mit dem Pfeilgift im Leibe
ta-li !gowara //goe	Läufst du mit dickem Kopf.

Der Elefantentanz wird sonderbarerweise mit dem Refrain gesungen: „Das Owambomädchen geht zwischen den Männern herum."

Die !Kung haben auch ein Kampfspiel. Es bilden sich zwei Parteien, die sich auf ziemliche Entfernung in Front gegeneinander aufstellen und nunmehr mit Vogelpfeilen aufeinander schießen. Die Buschmänner haben eine ungeheure Fertigkeit darin, diesen Pfeilen auszuweichen.

Über die Hei//om bei Tsintsabis berichtet mir Farmer Friedrich bei Duwib: Wenn der Werftälteste stirbt, dann macht dessen Nachfolger einen Einschnitt auf seiner Stirn zwischen den Augenbrauen und spritzt das Blut gegen Osten, dann schneidet er sich in den kleinen Finger und spritzt das Blut nach Westen. Dies geschieht, damit der tote Häuptling im Jenseits dafür sorge, daß die Hinterbliebenen immer Feldkost haben.

Bei der Mädchenweihe werden die Geister des Ostens und Westens in Liedern angefleht, die junge Frau immer Feldkost finden zu lassen.

Hat der Mann nach mehrtägigem Jagdzuge Verdacht, daß die Frau ihm untreu geworden ist, so kann er durch ein ‚Ordal' den Tatbestand klären. Er nimmt eine harzige Wurzel, die wie eine Kerze mit heller Flamme brennt, stellt diese abends in den Eingang seiner, d. h. seiner Frau Hütte und beobachtet die Richtung, die die lange Flamme andeutet. Weist die Flamme in das Innere des Hauses, so ist Ehebruch während seiner Abwesenheit vorgekommen. Weist sie nach außen, so ist die Frau unschuldig."

20. DAS RECHT

Die Normen des natürlichen Rechtes sind bei den Buschmännern die gleichen wie bei uns. Das Familienoberhaupt ist zugleich der oberste Richter. Da aber bereits die nächste Sippe gewissermaßen als fremder Staat gilt, sind die Grenzen zwischen Recht, Krieg und Rache durchaus fließend. Der Rechtsbereich beschränkt sich also eigentlich auf die Familie. Da die einzige Strafe, die wirklich verhängt werden kann, nur die Todesstrafe ist, so wird sie bei verheirateten Männern nur selten ange-

[1] W. H. J. Bleek and L. C. Lloyd, l. c., S. 430.

wendet, weil je Richter und Nachrichter für den Unterhalt der Hinterbliebenen des Verurteilten aufkommen müssen. In alter Zeit wurden die zum Tode verurteilten Frauen verbrannt oder mit dem Kirri erschlagen, die Männer mit dem Giftpfeil getötet.

Das Recht auf persönliches Eigentum an Gebrauchsgegenständen, Honig und bestimmten Feldkostsorten, wird streng geachtet. Der Boden ist gemeinsames Eigentum der Sippe, ebenso wie das erlegte Großwild. Verendet ein angeschossenes Wild im Bereich der Nachbarsippe, so muß der Jäger dorthin gehen und dies melden. Die erlegte Beute soll dann geteilt werden. Da es jedoch einige unpaare Organe gibt, so entsteht darüber leicht Streit und Totschlag. Blutrache wird geübt, kann jedoch durch Verhandlungen abgelöst werden.

Jede Sippe hat seit uralten Zeiten ein angestammtes Sippengebiet. Das Gebiet wird Gao genannt und dürfte sich mit dem deutschen Begriff „Gau" decken.

Es gibt Sippen, die Tagereisen weit auseinander liegen. So gehört der Landstrich nördlich des Omuramba-Ovambo bei Kajus, wo der Mankettibaum (Ricinodendrum Bantanenii) vorkommt, einer Sippe, die für gewöhnlich über 1000 km weit entfernt wohnt und nur dorthin kommt, wenn die ölhaltigen Früchte reif sind.

Sippen mit zwei Jagd- und Sammelgebieten entstehen auch durch Verschmelzung zweier Sippen, die so lange untereinander geheiratet haben, bis die Verschmelzung sich von selbst ergab.

„Innerhalb des Gebietes der Sippe befinden sich die Gräber der Ahnen. Sie sind durch große Steinhaufen, die darauf gelegt sind, gekennzeichnet. Man hält die Ahnen für Wächter des Sippengebietes. Das Verlassen des Sippengebietes muß daher vom Häuptling oder einem Alten ohne besondere Feierlichkeiten am Ahnengrabe angekündigt werden; ebenso muß an diesem Orte Mitteilung gemacht werden, wenn die Sippe das Gebiet wieder bezieht."

Zum Eigentum der Sippe gehört außer dem Sippengebiet die Feldkost, das Jagdwild und vor allen Dingen die Wasserstelle[1].

Der Buschmann glaubt, wie schon gesagt, nicht an eine Vergeltung im Jenseits. Dagegen ist er davon überzeugt, daß das Böse, welches er selbst getan, ihm oder seinen Hunden in der gleichen Weise widerfahren werde.

In früherer Zeit war das Vertreiben aus dem Sippenverband ebenfalls üblich und der Verbannte mußte bald zugrunde gehen, da der Buschmann auf sich allein gestellt auch nicht längere Zeit in der Wildnis leben kann. Heute ziehen solche Individuen genau so wie diejenigen, die aus den Stämmen der Bantu ausgeschieden wurden, in das Land der Europäer und finden dort Arbeit. Daß sie da nicht dazu beitragen, den Ruf der Farbigen zu heben, ist selbstverständlich.

In Zweifelsfällen schwört der Buschmann beim großen Kapitän: nu χ'u

Statt der formellen Verbannung übt man auch den Boykott an dem Verfemten, der dadurch oft so zur Verzweiflung getrieben wird, daß er Selbstmord begeht. Selbstmorde kommen auch aus anderen Gründen vor.

21. KONFLIKTE MIT DEN EUROPÄERN

Bevor die Polizeizonengrenze errichtet wurde, befanden sich die Buschmänner in einem latenten Kriegszustand mit ihren Nachbarn. Einiges aus ihren Sündenregistern sei angeführt.

Nach Toke überfielen die !Kung bei Keibeb 1925 8 Barotse und töteten sie und haben sie angeblich gefressen. Später wurden 3 Ovambo überfallen, umgebracht und das Gehirn gegessen. (Letztere Nachricht bezog sich wohl auf die Leute von Karakowisa.) Über unsere !Kung schrieb gleichzeitig (1927) ein Farmer:

„In letzter Zeit mehren sich die Klagen über das Schlachten von gestohlenem Vieh durch Buschleute in beunruhigender Weise. In den seltensten Fällen gelingt es, die Täter zur Bestrafung zu bringen. Zwar gibt sich die Polizei die größte Mühe, aber ein Erfolg ist selten. Zunächst kann ein einzelner weißer Polizist mit einem eingeborenen Polizeidiener den schnellbeweglichen Buschleuten gegenüber nicht viel ausrichten. Er wird auch meist zu spät eintreffen, um die Verfolgung erfolgreich aufnehmen zu können. Die betroffenen Farmer haben allerhand Vorschläge gemacht, die meist darauf hinauslaufen, daß Polizei und Farmer gleichzeitig den streifenden Buschleuten nachstellen sollten. Das Beste wäre wohl, den beschäftigungslosen Buschleuten eine deutliche Grenze zu ziehen, über die sie nicht in von Weißen bewohntes Gebiet übertreten dürfen. Daß der Buschmann Grenzen zu achten weiß, geht daraus hervor, daß er sich wohl hütet, in das Jagdgebiet einer anderen Sippe einzudringen. Jeder Buschmann, der innerhalb eines solchen von Weißen bewohnten, abgegrenzten

[1] Zastrow und Vedder, l. c., S. 434.

Gehöftes betroffen wird, sollte ohne weiteres verhaftet und mit Zwangsarbeit bestraft werden, die ihm bei seiner heiligen Scheu vor jeder Arbeit wohl am unangenehmsten sein wird.

Unter den heutigen Zuständen leiden hauptsächlich die Farmer, die an das Buschmanngebiet grenzen, in einer Weise, daß mancher sich ernstlich mit dem Gedanken trägt, die Farmerei aufzugeben, weil ihm sonst in absehbarer Zeit das letzte Stück Vieh geschlachtet sein wird. Man müßte dem Farmer erlauben, mit Nachbarn zusammen von frischen Schlachtplätzen führende Spuren zu verfolgen und im Ernstfalle auf die Buschleute zu schießen, wie es ja auch der Buschmann umgekehrt mit seinem Pfeil und Bogen tut. Der Buschmann erkennt keine Obrigkeit an, man sollte ihn darum unter Ausnahmegesetze stellen. Wenn, wie es kürzlich hier vorgekommen ist, eine starke Polizeistreife fast einen Monat unterwegs ist, um Viehräuber zu fangen, und dann die 12 Angeklagten, die zweifellos geschlachtet haben, sämtlich freigesprochen werden müssen, weil ein Kronzeuge nicht Stange hält, dann passen unsere Gesetze für diese Buschleute eben nicht. Man kann wohl verstehen, daß der geschädigte Farmer, dem in kurzer Zeit etwa 20 Stück Großvieh gestohlen und aufgefressen wurden, angesichts des Freispruches die Verzweiflung bekommt, kann er sich doch ausmalen, daß durch den Freispruch, dessen Gründe die Buschleute doch nicht verstehen, diese zu neuen Taten angeregt werden."

Aus der Epukirogegend berichtet ein anderer:

„Ich bin nicht weit von der Grenze des Betschuanenlandes. Es gibt hier viele herumstreichende Buschleute, die mit vergifteten Pfeilen bewaffnet sind. Diese Buschleute überfallen häufig das Vieh der Eingeborenen, wenn dieses sich etwas weiter von dem Kraal entfernt. Vor einigen Tagen stahlen und schlachteten Buschleute zwei Stück Großvieh, das zu einem Hererokraal gehörte, der ungefähr 6 Meilen von unserem Lager entfernt liegt. Die Herero folgten der Spur der Buschleute und fanden sie. Die letzteren machten sofort von ihren Bogen Gebrauch, und einer der Hereros wurde mit einem Pfeil in der rechten Brustseite verwundet. Die Verwundung erfolgte um ungefähr 4 Uhr nachmittags, am nächsten Tage um 1 Uhr nachmittags starb der Verwundete. Sobald mein Freund von der Sache erfuhr, sandte er etwas übermangansaures Kali in den Kraal mit der Anweisung, wie es zu gebrauchen sei. Doch scheint dieses zu spät eingetroffen zu sein. Eines der Pferde wurde am Kopf leicht verwundet, scheint jedoch keinerlei üble Folgen zu spüren. Ich sah die Leiche des Herero am frühen Morgen nach seinem Tode; sie war stark aufgeschwollen und verwest. Die Eingeborenen erzählten, daß die Verwesung bereits vor dem Tode eintrat. – Wie erinnerlich, wurde vor drei Jahren der Gobabiser Magistrat, Herr Reyneveldt, in derselben Gegend von Buschleuten mit einem Giftpfeil verwundet und starb kurze Zeit darauf."

(Diese Daten sind der „Windhuker Zeitung" entnommen.)

SIEBENTES KAPITEL

DIE BUSCHMÄNNER DES NORDENS

Die besten Kenntnisse haben wir durch Dornan[1] und Holub[2] von den Masarwa, von deren Kultur im folgenden nach diesen beiden Autoren ein Abriß gegeben wird.

Nach Dornan wohnten die Masarwa einst mit Vorliebe in Höhlen, wo ihre Vorväter auch gemalt haben. Die Buschleute in den Distrikten Wankie und Ngami haben geflochtene Matten aus Gras oder Schilf, mit denen sie die Windschirme decken. Manchmal machen sie eine Art von Dach, das mit Gras gedeckt ist, sonst die gewöhnlichen Windschirme.

Für das Bogenholz verwenden die Masarwa ganz gerade Stämmchen, die entrindet und an einen geraden Baum angebunden werden, wo man sie teilweise trocknen läßt. Dann trocknet man das Bogenholz endgültig über Feuer und legt es auch in Wasser, damit es nicht splittert. Oft ist auch die Mitte des Bogens mit Sehnen umwunden. Der Bogen wird öfters eingefettet und niemals entspannt. Der fertige Bogen wird mit einem rauhen Stein geglättet.

Gleich den prähistorischen Buschmännern tragen auch sie Stirnbinden, in welche die Pfeile während der Jagd eingesteckt werden.

Dornan (S. 139) berichtet, daß die Kalahari-Buschmänner vor Beginn eines Krieges Tänze abhalten, bei welchen sie kleine vergiftete Pfeile von ebenso kleinen Bogen in der Richtung auf den Feind oder gegen die Sonne abschießen. Sie glauben, daß dadurch der Schattengeist des Feindes getötet würde. Sie geben diese kleinen Pfeile und Bogen nicht gerne her, weil sie fürchten, diese könnten in den Besitz ihrer Feinde übergehen und ihnen so Verderben bereiten.

Die Fischerei ist bei den Masarwaleuten noch recht ausgebildet. Teilweise werden Steinwälle in den Fluß hineingebaut, in die Reusen eingesetzt sind, oder sie setzen sich mit den Reusen nebeneinander in das Flußbett, während Frauen und Kinder ihnen die Fische zutreiben. In kleineren Wasserlöchern wird Gras und Gestrüpp an einer Seite aufgehäuft. Dann steigen die Buschmänner ins Wasser und schieben die Graswand vor sich her und treiben so die Fische in die Enge. Einzelne Fische werden auch mit dem Assagai gespießt. Nach Hodson sind die besten Fischer die Bakoba-Buschmänner am Okawango. Sie haben Binsennetze, die quer über die Flüsse gezogen werden und Harpunen.

G. A. Farini[3] hatte Gelegenheit, im Chansefeld die Erzeugung des Pfeilgiftes zu beobachten. Die Männer versammelten sich an einem bestimmten Platz; Frauen durften nicht anwesend sein. Etwa 30—40 gifthaltige Zwiebeln wurden durch allmähliche Einschnitte ihres Saftes beraubt und dieser in einem Topf gesammelt. Bei jedem Schnitt tanzten die Buschmänner in der Runde, wobei sie eine Art Grunzen ausstießen. Dann wurde ein Hyänenfell mit den Haaren nach unten ausgebreitet und darauf der Inhalt der Beutel, welche getrocknete Giftschlangenköpfe enthielten, nebst zwei Stückchen Schilfrohr von etwa 15 cm Länge ausgebreitet. Dann wurden einige frisch getötete Giftschlangen gebracht. Unter Gesang und Händeklatschen wurden die Giftblasen herauspräpariert. Inzwischen war der Gifttopf ans Feuer gestellt worden und kochte, dann trat einer nach dem andern zu dem Topf hin und warf seinen Anteil an Schlangengift hinein. Sodann wurde der Topf sogleich vom Feuer weggestellt. Die Buschmänner führten nunmehr einen neuen Tanz auf, in welchem sie die Zuckungen der an dem Gift sterbenden Tiere nachahmten. Nach einer weiteren halben Stunde war das Gift klar, und als sich alle überzeugt hatten, daß es die rechte Farbe habe, wurde ein rotes mineralisches Mehl beigesetzt und gut umgerührt. Dann wurden aus den Schilfrohren Giftspinnen herausgeholt und in den

[3] G. A. Farini, Durch die Kalahariwüste. Leipzig 1886.

3: Lebaelter FX10 Bushmen

Topf geworfen. Diese stammten vom Langen Berg in der Kapkolonie, waren also von weit hergebracht. Als die Masse wieder etwas mehr eingedickt war, wurden die Pfeile damit beschmiert und im Schatten getrocknet (l. c., S. 380).

Diese Buschmänner, die M'Kabba, sind Monogamisten.

Farini behauptet (l. c., S. 171), einen schwarzen Zwerg getroffen zu haben, der vom Stamme der Kara-Kara nördlich des Ambolandes kam[1].

Über die Speisen der Buschmänner weiß Dornan folgendes zu berichten: Die Marsawa essen das Fleisch geröstet oder gebraten, selten gekocht, weil sie glauben, daß letzteres sie krank mache. Die Buschmänner des Basutolandes zerlegten das Fleisch in kleine Stückchen, mischten es mit Fett und nähten es dann als Konserven in Fellsäcke ein. Als Reserven für Hungerzeiten bewahren die Kalahari-Buschmänner Giraffenhäute auf hohen Bäumen auf. Feldkost wird in Schildkrötenschalen und Straußeneiern aufbewahrt, ebenso Wasser. Die Basutoland-Buschleute sammelten Grassamen und bewahrten sie für Hungerzeiten auf.

Die Tsamas werden folgendermaßen zubereitet: Es wird ein Loch gemacht und darin Feuer angelegt. Sobald der Boden hinlänglich heiß ist, werden Asche und Feuer herausgeworfen, die Melonen in den heißen Boden gelegt, die glühende Asche daraufgeworfen. Am nächsten Morgen sind die Tsama fertig.

Die größten Straußeneiperlen erzeugen die Masarwa.

Die Tanzmasken bestehen bei ihnen aus Schoten, Kokons, manchmal aber auch aus kleinen Fellbällen, die mit Klappersteinchen gefüllt sind. Sie kennen heute noch die Kunst der Töpferei. Körperbemalung weiß oder rot wird geübt.

Ein Buschmannstamm am Ngamisee soll die Sitte kennen, das letzte Glied des kleinen Fingers zu entfernen.

Dornan erwähnt folgende Medizinen der Masarwa: Gegen Schwarzwasserfieber: Anacampseros rhodesica; Ruhr: Monsonia ovata und Euclea lanceolata. Sonstige Medizinen: Cannabis sativa, Solanum nigrum, Lippia asperifolia, Crotalaria burkeana, Pterocarpus angolensis, Datura stramonium, Indigifera senegalensis, Bauhinia reticulata.

Die Masarwa behaupten, nur den Biß der Puffotter behandeln zu können. Der Körper der Lygosoma Sundervalli wird verkohlt und das Pulver in die Wunde gestreut. Jede Schlange wird getötet und ihr Kopf zerquetscht. Es gibt angeblich auch Impfungen gegen den Schlangenbiß.

Bei den Masarwa herrscht nach Dornan Monogamie. Geschlechtsverkehr vor der Ehe ist verpönt, auf Blutschande und Ehebruch steht die Todesstrafe. Zur Ehe ist in der Regel die Zustimmung des Mädchens erforderlich, im allgemeinen genügt es, wenn der Brautwerber dem Schwiegervater ein Stück Großwild präsentiert. Nur bei den Wankie-Buschmännern und denen von Bulalima wird die Jagdprobe geübt. Man kann ein Mädchen aus demselben Clan heiraten. Bei jenen Stämmen, die totemistisch beeinflußt sind, besteht zwischen den einzelnen Totems Heiratsverbot. Beschneidung wird geübt. Sobald die Knaben und Mädchen etwa 12 Jahre alt sind, findet die Beschneidung statt, bei welcher Steinmesser benützt werden. Bei den Mädchen wird die Klitoris mit einer Steinspitze durchbohrt. Geschlechtsverkehr zwischen den Unbeschnittenen ist streng verboten. Gelegentlich wird bei den Jünglingsweihen auch die Nasenscheidewand durchbohrt. Wie bei den Bantu wird jeder Todesfall auf Zauberei menschlicher Feinde zurückgeführt. In alter Zeit wurden die Toten angeblich in den Busch geworfen, heute werden sie teils in Hockerstellung in Termitenhügeln, teils in Felsspalten bestattet, häufig auch nach Betschuanenart in Seitennischengräbern. Den Männern werden die Waffen, den Frauen einige Straußeneier nebst Nahrung und Wasser mit ins Grab gegeben.

Nun zur Weltanschauung der Masarwa. Wie Dornan berichtet, ist Thora der ganz Große, welcher

[1] Auf der Missionsstation Urikuabothi teilte mir die um die Erforschung des Landes hochverdiente Frau Missionar Quarni mit, es seien kurz vor dem Kriege einige schwarze Zwerge, d.e in den Sümpfen am Kunene wohnten, zum Häuptling Moala gekommen. Sie hat diese Leute gesehen.

über allen Dingen ist. Er schickt den Regen und das Wild, Feldkost und Glück auf der Jagd. Sie rufen Thora oft an, um Glück auf der Jagd zu haben, und danken ihm, wenn sie solches gehabt haben[1].

Chapman berichtet, daß Buschmänner, die einmal ein Rhinoceros getötet hatten, etwas Staub auf den Schwanz und die Augen des Tieres streuten und dabei Dankesworte zu Thora murmelten.

Die Buschmänner sind sich nicht ganz darüber klar, ob Thora ein Geist ist oder nicht; auf jeden Fall haben sie großen Respekt vor ihm. Sie glauben, daß Thora alle Dinge macht, aber sie wissen nicht, wo er wohnt und ob er überhaupt eine Person ist. Die westlichen Stämme gebrauchen hauptsächlich das Wort Huwe. Aber auch die Tati kennen dieses Wort und halten Huwe für einen guten Geist, der die Krankheit fernhält, Überfluß an Nahrung gibt und die Buschmänner in Gefahren schützt. Sie rufen ihn in der Not an. Die Sansoque sagen, Huwe ka hume le le (Huwe komm und hilf uns). Huwe scheint aber schwächer als Thora zu sein und muß sich an ihn um Hilfe wenden. Ein Buschmannsgesang vom Thuli lautet: Tho-ra ba Hu-we le le (Thora komm Huwe zu Hilfe).

Bei vielen Buschmannstämmen und auch bei den Hottentotten kennt man auch ein böses Prinzip „Khauna", ein Begriff, der noch aus der Zeit stammt, als Buschmänner und Hottentotten noch ein Volk waren. Die Kalahari-Buschmänner sind übrigens nicht sicher, ob Thora oder Khauna die ersten Menschen gemacht hat.

Die Kalahari-Buschmänner glauben gelegentlich, daß Menschen und Tiere ihre Gestalt verwandeln könnten und so etwa ein Mensch als Leopard auftreten kann. Speziell Springböcke, Paviane und einige Schlangen halten sie für Menschen in einem anderen Stadium ihrer Daseins. Das Auftreten der Ringhalsschlange zeigt Unglück an.

Stärker mit animistischen Vorstellungen ist das Weltbild der Masarwa durchsetzt[2]. Nach Dornan ist jedes Ding eine Art Geist. Menschen und Tiere können sich ineinander verwandeln. Einzelne Doktoren verwandeln sich in Leoparden, und viele Tiere werden überhaupt für andere Erscheinungsformen des Menschen gehalten, besonders der Springbock, der Pavian und einige Schlangen. Wenn eine Ringhalsschlange in die Nähe eines Gehöftes kommt, so kündet sie den Tod an. Hier sind zweifellos Bantueinflüsse wirksam.

Die Zweiseelenlehre der !Kung kehrt in anderer Form bei den Masarwa wieder. Der Schatten jedes Dinges sowie auch der des Menschen ist seine andere Seele. Sie glauben nun, daß die Schattenseele in der Nähe des Grabes bleibe, während das Ich an einen anderen Platz ginge, wo es mit den Vätern zusammentäfe. Dort sei es warm und gäbe es viel Wild. Man tut im Jenseits das gleiche wie auf dieser Welt. Wie die Namib-Buschmänner werfen sie Steinchen auf das Grab und bitten dabei, der Geist des Toten möchte ihnen Glück bringen (Dornan, l. c., S. 146).

Auffassungen, die an die Gewissenslehre der Zulu anknüpfen, beziehen sich auf die Träume. Im Traum spricht das andere Ich mit dem Träumenden, und dieses kann gut oder böse sein. Das andere Ich kann von Feinden beeinflußt werden und so der Zwillingsseele Böses tun.

Nach Dornan haben die Bantu die Orakelhölzer von den Buschmännern übernommen. Jeder Masarwa trägt 4—5 Stück mit sich. Die weiblichen sind länger und schmaler als die männlichen. Sie werden aus den Hufen kleiner Säugetiere, aus Wildebeest-Knochen und Fruchtkernen gemacht. Die Namen der 4 Hölzer sind: Chowe, Kao, Daua, Gaichwe. Die Masarwa glauben, daß durch diese

[1] P. Schebesta, Die religiösen Anschauungen Südafrikas. Anthropos XVIII/XIX, 1923/24.

[2] Die Kalahari-Buschmänner haben (Dornan, l. c., S. 165) einige Kenntnis von den Sternen. Das südliche Kreuz ist eine Giraffe, die Kap-Buschmänner aber hielten sie für eine Gruppe von Löwen. Einige Buschmänner halten die Sterne für Tiere oder Menschen, die zum Himmel hinaufgegangen sind.

Man erzählt auch folgende Geschichte: Ein Mädchen, das Zauberkräfte besaß, nickte während der Mädchenweihe auf einige Löwen und diese wurden sogleich in Sterne verwandelt.

Die Kap-Buschmänner erzählten eine andere Historie: Ein Mädchen zankte sich mit ihrer Mutter während der Zeit der Mädchenweihe, weil diese ihr bestimmte Wurzeln nicht zu essen geben wollte, deren Genuß zu dieser Zeit verboten ist. Das Mädchen ergriff die Wurzeln und die Asche und warf sie zum Himmel. Die Wurzeln wurden zu Sternen, die Asche zur Milchstraße. – Sternschnuppen bedeuten Unglück.

Knochen Thora und Huwe, vielleicht auch Khauma sprechen, und Mackenzie[1] sagt, die Buschmänner hätten diese Knochen als Morimo aa'me (Sachen von Gott) bezeichnet.

Auch das Schulterblatt des Springbocks wird von den Masarwa zum Wahrsagen benutzt.

Bei den Masarwa darf die Schwiegermutter den Schwiegersohn nicht sehen und seinen Namen nicht nennen. Die Gattin darf weder den Namen ihres Mannes noch die Namen seiner Verwandten aussprechen.

Über die Sumpfbuschmänner des Okawangodeltas schließlich berichtet J. Seiner:

„Die Tanzekwe besitzen Sommer- und Winterdörfer sowie Boote und Ziegen und treiben Ackerbau, Fischfang und Jagd. Letzteren Erwerbszweigen wenden sich die reinen Buschmänner zu, während die Bastards und die reinen Mambukuschu, die als Kinder geraubt und von den Buschmännern aufgezogen wurden, mit Ackerbau und untergeordneten Arbeiten sich abgeben.

Die Zahl der reinrassigen Buschmänner unter den Tanzekwe dürfte sich noch auf 60% der letzteren belaufen, doch ist sie infolge der geringen Vermehrung der echten Buschmänner, die durch Diebstahl von Mambukuschukindern auszugleichen versucht wird, in stetem Abnehmen begriffen und die Verbastardung schreitet rasch vorwärts. Die Bugakwe bewohnen in fünf Dörfern mit 220 Köpfen das westliche Okawangotal von der Mahangofurt abwärts und stehen in einem Hörigkeitsverhältnis zu Libebe, mit dem sie jedoch bezüglich der Höhe der Abgaben oft in Zwist geraten; bei einem solchen wurde im Juni 1905 ein Mambukuschu durch einen Pfeilschuß getötet. Die Gorkwe sitzen in acht Dörfern mit 430 Seelen im östlichen Ärmellande vom Palibasumpf bis zum Beginn des Tales, während die Gorkwe im südlichen Ärmellande westlich des Flußlaufes sich aufhalten. Ich fand von letzteren nur ein Winterdorf mit 90 Köpfen vor, und zwar nordöstlich der Mündung des Namasere auf einer Flußinsel.

Die Gorkwe dürften mit Passarges Gokwe identisch sein, deren Gebiet vom Westrande des Taurbesumpflandes tief in das Kaukaufeld reicht; ihnen gehören die Tschorilloberge. Die Tanzekwe unternehmen in der Regenzeit Jagden in die benachbarten Steppen. Die Hukwe, deren Zahl ich auf mindestens 600 schätze, sind weniger verbastardet als die Tanzekwe, leben aber ebenfalls in richtigen Dörfern, von denen aus sie in der Trockenzeit familienweise je nach Bedarf in die Waldsteppe zum Sammeln oder Jagen ausschwärmen."

ACHTES KAPITEL

DIE NOGAU-BUSCHMÄNNER VON EPUKIRO

Bei meinem Aufenthalte in der Missionsstation Epukiro hatte ich Gelegenheit, mit den Buschmännern in näheren Kontakt zu kommen, welche mit den Betschuanen[2] in einer gewissen Symbiose leben. Sie bezeichnen sich selbst als Nogau, im besonderen als ǂno /gna ikhou, d. i. Leute, die am Wasser wohnen. Sie sitzen mehr im Norden des Omuramba Epukiro gegen Alexeck zu. Nördlich von ihnen sitzen die Gai-kwe, mehr gegen Osten zu und im Norden die !Kung. Darüber hinaus ist ein großer Fluß und viele schwarze Leute (Okawango). Als ihre westlichen Nachbarn kennen sie nur die Herero. Sie sind also viel später hingekommen als diese. Zweifelsohne sind Leute dieser Gruppe noch vor 20 Jahren am mittleren Omuramba Omatako gesessen, wo sie F. Seiner von Otjituo und Nuragas meldet. Südlich von ihnen wohnen die Naron und südöstlich die ǂAuin. Im Südwesten wohnten, früher wenigstens, Buschleute der Hei//om-Gruppe und /Gowanin (Sandkaffern). Diese Hei//om sind es wohl, die früher als Saan bezeichnet wurden. Nogau, ǂAuin und Naron gehören eigentlich schon zur Kalahari-Gruppe. In der ganzen Farmzone, die sich früher bis zur englischen Grenze ausdehnte, wurden die Stammesverbände mehr oder weniger zerstört, und es entstand eine gemischte Buschmannbevölkerung, die von den freien Stämmen immer wieder Zulauf erhielt. Auf der anderen Seite sind aber immer wieder Buschleute aus der Farmzone, teils freiwillig, teils auf der Flucht vor der Polizei, in den Busch gegangen. Im Distrikte Gobabis fällt die Grenze der Polizeizone mit der Landesgrenze zusammen. Die Beziehungen zwischen den Weißen und Herero einerseits und den Buschmännern andererseits sind daher

[1] Ten years North of the Orange River, S. 136.

[2] Über das europäisierte Betschuanendorf Epukiro berichte ich ausführlich: Zeitschrift für Ethnologie, Bd. 65 (1933).

sehr gespannte. Nachdem vor einigen Jahren den Buschmännern die Jagd auf Großwild verboten worden war, erhoben sie sich und sagten dem Magistrat in Gobabis Fehde an, indem sie eines Nachts einige Pfeile gegen die Türe seines Hauses abschossen. Der Magistrat von Rynefeldt wollte sie im Busch aufsuchen, wurde jedoch aus dem Hinterhalt mit einem Giftpfeil angeschossen und starb. Es wurde nun eine große Razzia gegen die Buschmänner veranstaltet, viele von ihnen wurden ins Gefängnis nach Gobabis gebracht, wo eine Anzahl infolge der vitaminarmen Kost zugrunde ging. Seither haben die Buschmänner sich in dieser Gegend wieder einen Oberhäuptling gewählt und stellen eine beschei-dene Macht dar. Infolge dieser Verhältnisse war es viel schwerer, ihr Vertrauen zu gewinnen, als im Norden. Hier waren mir insbesondere P. Watterott und der Dorfschulze von Epukiro, Franz Arenat, behilflich. Diese Buschmänner verdienen darum ein besonderes Interesse, weil es bei ihnen eine eigene Frauensprache gibt. Diese heißt: Hee-aziba ho auseashu. Sie wird zum Teil auch von den Kindern ge-sprochen und ist dadurch charakteristisch, daß sie viele Worte enthält, die keine Klixe haben. Ich konnte mit großer Mühe nur einige Worte aufzeichnen, z. B.:

Fig. 22/23. Abrollung der Einritzungen auf Stöcken der Buschleute. (Museum für Völkerkunde, Hamburg). Vgl. auch K. Weule: Botenstäbe bei den Buschmännern. Eine südafrikanisch-australische Parallele. Jahrbuch des Museums für Völkerkunde, Leipzig. Bd. 6, 1913/14.

Die beistehenden Figuren bieten die Einritzungen auf Botenstäben dar, also wohl eine Art Bilderschrift. Von Zastrow und Vedder, l. c., S. 430, bemerken hierzu:

„Wer nicht selbst zu einer befreundeten Sippe gehen will, sondern einen Boten schickt, hat diesem Boten einen Botenstab mitzugeben. Dieser ist etwa von der Dicke eines Daumens und trägt zahlreiche Zeichen von Blättern, Würmern, Raupen, Bilder von Mäuschen und Tieren und sonstige Figuren. Die Figuren nehmen sich fast wie Brandmalerei aus, sind aber auf ganz andere Weise hergestellt. Der abgeschälte Stab wird im Feuer erwärmt, in dem so weichgewordenen Oberholz werden mit einem Pfriemen oder einem scharfen Dorn die Zeichnungen Pünktchen für Pünktchen eingestochen. Ist ein Zeichen fertig, so nimmt man den Kern der Ere-Pflaume, der in geröstetem Zustande schwarz ist und sich wie eine feste Fettmasse verstreichen läßt. Die schwarze, öhaltige Farbe dringt durch das Verstreichen in die eingestochenen Löcher ein. Mit einem geschmeidigen Stäbchen Wildfell wird sodann die überflüssige Farbe abgewischt. Buschmänner behaupten, daß jede befreundete Sippe die verschiedenen Botenstäbe der Häuptlinge anderer befreundeter Sippen kenne, und daß ein Fälschen der Botenstäbe unmöglich und unmöglich sei."

Der Rasse nach sind diese Buschmänner kleiner und heller als die des Nordens und enthalten in einem viel höheren Prozentsatz Beimengungen der Südbuschmannrasse. Es ist in diesem Gebiete ein fortwährendes Kommen und Gehen. Seiner[1] berichtet folgendes:

„Die Buschmänner der Umgebung von Rietfontein sind deutschfreundlich und leisteten der Stationsbesatzung wiederholt wirksame Hilfe gegen durchziehende Herero und Ovambandjera. Zur Zeit meines Aufenthaltes im Jänner und Februar 1907 lag eine kleine Werft der Au-ain, die zu Passarge Kaukauvolk gehören, 1 km nördlich der Kaserne und eine Werft der Al-khoe, die Passarge zum Ngamivolk rechnet, 1½ km südwestlich der Station. Die Buschmänner der zuletzt erwähnten Werft waren den Au-ain dienstbar und wurden von ihnen als Naru (Untergebene, Sklaven) bezeichnet. Da Dr. Pöch im Juni 1908 nur Au-ain in Rietfontein vorfand, so scheinen die Al-khoe mittlerweile ausgewandert oder von jenen vertrieben worden zu sein."

Bis zu einem gewissen Grade stellen alle diese Stämme eine kulturelle Einheit dar. Für die ǂAuin liegt eine schöne Studie von Oberleutnant Kaufmann[2], für die Naron von D. F. Bleek[3] vor. Wenn ich diese Stämme nunmehr miteinander vergleiche, so versteht sich, daß nur die Angaben über die Nogau von mir stammen.

1. GEBURT UND KINDHEIT

Bei den ǂAuin schlingt der Gatte der Kreißenden die Sehne seines Bogens um den Bauch, bei der Geburt selbst ist er nicht anwesend. Die Nabelschnur wird mit der Spitze eines Schilfrohrsplitters durchschnitten.

Bei den Naron und Nogau erfolgt die Entbindung wie bei den !Kung, doch leistet eine alte Frau meist Assistenz.

Zwillinge (Hol-holi) sind unerwünscht, bei den Nogau wird eines getötet.

Der Vater gibt bei den Nogau dem Kinde den Namen. Dort wird das Kind mit einem scharfen Quarzsplitter abgenabelt. Die Wöchnerinnen dürfen Blut und Kopffleisch nicht essen. Bis das Kind sitzen kann, darf der Ehemann der Mutter nicht beiwohnen. Dieselbe Sitte besteht auch bei den Betschuanen. Die Kinder der Nogau dürfen das Fleisch der Wildkatze und das zweier Vögel (tsugnussi und /gui) nicht essen. Kaufmann hat einige Angaben über Kinderspiele gemacht; auch Bleek bringt einige Data:

Bei den /[illegible] dienen kleine Bogen und Pfeile als Kinderspielzeug. Das gleiche gilt für die Naron und Nogau. Steinen sind bei den Auin bekannt und werden von Männern und Knaben benutzt. Über Kinderspiele der Naron berichtet Miß Bleek:

Das Spiel der großen Wasserschlange

Ein Junge kriecht auf dem Bauch zu einem kleinen Sandhaufen, der das Wasserloch darstellen soll. In einiger Distanz davon setzen sich die Kinder in eine Reihe, einer hinter dem anderen so, daß das folgende seinen Vordermann zwischen seinen Beinen sitzen hat; den Vordermann hält er mit den Händen an der Schulter. Der Größte

ältest immer vorne, der Kleinste rückwärts. Dazu wird ein Lied gesungen, das zum Teil nicht mehr verständlich ist. (Wahrscheinlich Kindersprache.) Diese große „Schlange" bewegt sich nun um das Wasserloch, ganz langsam, während die Wasserschlange von Zeit zu Zeit Sand auf sie wirft; dann ziehen sich die anderen zurück. Zum Schluß fängt sich die Schlange einen aus der Reihe heraus und „frißt ihn". Ein analoges Spiel habe ich bei den Betschuanenkindern im Epukiro beobachtet.

Das Elefant-Strauß-Spiel

Wieder dient ein Sandhaufen als Kraals für ein Wasserloch. Zwei Jungen kommen als Elefanten und wollen trinken; zwei andere nimmen Strauße und wollen die Elefanten nicht zum Wasser lassen.

Das Ochsen-Spiel

Drei oder vier Jungen repräsentieren die Ochsen. Einer gilt als der Besitzer, der andere will sie stehlen. Unter kleinen Balgereien gelingt ihm dies allmählich. Hat er alle gestohlen, dann ist das Spiel zu Ende. (Man vergleiche hierzu das „Ochsenstehlen" bei den Bergdama von Okombahe.)

Das Tauschhandel-Spiel

Es gleicht völlig analogen Spielformen in Europa.

Das Kriegs-Spiel

In zwei Reihen stehen die Jungen einander gegenüber und markieren Pfeilschüsse. Derjenige, auf welchen gezielt wird, sucht sich zu decken. Sobald er müde wird, fällt er um als „Toter". Das Spiel wird so lange gespielt, bis nur einer übrigbleibt.

Das Brautraub-Spiel

Zwei junge Mädchen tanzen hinter einem Busch, das sind die Bräute. Zwei ältere Mädchen mit Stecken folgen ihrer Spur, das sind die Brautwerber, diese suchen die beiden Bräute zu fangen. Ist ihnen das gelungen, dann kommen noch zwei Mädchen, die die Mütter darstellen sollen und den Brautraub zu verhindern trachten. Schließlich werden die Bräute aber doch geraubt.

Das Ball-Spiel

Das Ballspiel ist ein ausgesprochenes Frauenspiel, an dem sich kleine Mädchen und Großmütter in gleicher Weise beteiligen. Die Spieler stehen in zwei Reihen einander gegenüber, und der Ball, gewöhnlich eine runde Wassermelone, wird von einer Reihe zur anderen geworfen.

2. DIE KNABENWEIHE

Zur Zeit der Reife finden dann bei den Nogau die Jugendweihen statt. Die Knabenweihe heißt Dschai-dschua.

Durch die Verheiratung wird der junge Mann noch nicht in die Gemeinschaft der Männer aufgenommen. Er muß sich erst der Weihe unterziehen. Diese verläuft bei den Nogau folgendermaßen:

Unter Führung eines erfahrenen Alten und mehrerer Gehilfen gehen die Jungen in den Busch. Am ersten Tage werden zwei Vertikalschnitte auf der Stirne gemacht, dann wird die ganze Nacht durch gesungen und getanzt nach der Melodie: „Ije, ije, aije, aije . . . oho, oho usw."

Am Morgen des zweiten Festtages werden die Einschnitte auf der Stirn bis zur Nasenwurzel und zur Haargrenze verlängert. Am Nachmittag dieses Tages rufen die Alten die Jungen zusammen, um Feldkost zu suchen. Der Alte lockert mit seinem Grabstock die Wurzeln und, während er dies tut, legen die Kandidaten ihre Hände auf den arbeitenden Arm. Die Jungen müssen dann ohne Zuhilfenahme von Werkzeugen mit den Händen die Wurzeln aus der Erde herausgraben. „Von nun an können sie selbst Feldkost suchen, denn nun hat man sie angelernt."

Nach dieser Handlung geht man wieder auf den Platz, wo die Frauen sind. Dort wird an einem

Platze zusammen für die Männer und die Kandidaten Kost gemacht, die Kandidaten dürfen nur Feldkost essen, kein Fleisch. Dann wird zusammen mit den Frauen und Mädchen eine Nacht und ein halber Tag getanzt.

Am Nachmittage gehen die Kandidaten wieder hinaus auf die Jagd. Drei Tiere müssen sie erbeuten: einen kleinen Duiker, ein Perlhuhn, einen Ochsenfrosch. Mit ihrer Beute versammeln sie sich mit den lehrenden Alten an einem abgelegenen Platz, die drei Fleischsorten werden zusammengekocht, das Fleisch essen die Alten, und mit der Suppe werden die Jungen am ganzen Körper gewaschen. Von nun an dürfen sie die drei Tiere essen, was ihnen bisher verboten war. Nun wird wieder getanzt und gesungen: „Oouu, oouu, oouu, oouu, oouu" (langgezogen).

/Auin: Die Kandidaten benachbarter Werften ziehen unter Leitung des Doktors in den Busch und leben hier einige Wochen gemeinschaftlich von Feldkost. Sie erhalten während dieser Zeit Weisungen in geheimen Dingen. Kaufmann berichtet von folgendem Tanz: ein Junge setzt sich rücklings auf den Rücken eines anderen und beide hüllen sich in einen großen Fellmantel. Der Tanz besteht darin, daß sich der Träger möglichst rasch von einem Bein auf das andere schwingt, ohne sich vorzubewegen, und beide hu, hu brüllen. Die eigentliche Mannbarkeit, welche ihnen das Recht zum Heiraten gibt, wird erst durch die Jagdprüfung erworben. Die Tatauierung hängt mit der Mannbarkeitserklärung nicht zusammen.

Bei den Naron allerdings müssen sie erst die Jagdprüfung machen, bevor sie zur Knabenweihe zugelassen werden. Zehn oder zwölf Kandidaten werden in den Busch genommen und müssen einen Monat von Feldkost leben, die vor dem Genuß vom Doktor mit einer Medizin bestreut wird. Frauen dürfen nicht in die Nähe des Lagers kommen.

Während einer dieser nächtlichen Tänze erscheint Hise und tanzt rund um den Kreis, dann wird er von dem Medizinmann vertrieben. Manche sagen, Hise sehe aus wie eine Frau, andere beschreiben ihn als ein drei Fuß hohes Wesen mit flachem Kopf, großen Augen, schwarzem Körper, Flügel und Klauen (man denke an den Geistervogel Engoroori, der bei der Initiation der Owambo erscheint, oder an den Neida Gamaseb der Bergdama).

Einige alte /Auin sahen zwei Wesen, ein männliches und ein weibliches, die wie Löwen aussahen, aber aufrecht gingen; sie waren von Kindern gefolgt, die wie Paviane aussahen.

Offensichtlich handelt es sich hier um Maskentänze. Die jüngeren Männer haben diesen Hise nicht mehr gesehen, ihnen erklärten die Doktoren, er sei gekommen, aber nur die Medizinmänner könnten ihn erblicken.

Ein besonderer Tanz für Hise besteht in der Nachahmung der Bewegung eines Vogels. In alter Zeit tanzte man auch zu zweit, wobei im Refrain gesungen wurde: „Straußenmagen, Hisemagen, hu, hu, hu".

Auch der /Di-Tanz ist Hise geweiht. Bei diesem Tanz tragen die Männer, wie auch sonst bei profanen Tänzen, die oben beschriebenen Tanzrasseln, aber außerdem weiße oder schwarze Straußenfedern.

3. DIE MÄDCHENWEIHE

Wenn bei den Nogau ein Mädchen die erste Menstruation bekommt, wird ein Fest gefeiert. Am ersten Tage muß das Mädchen den ganzen Tag über in einem eigens für sie errichteten laubhüttenartigen, geschlossenen Pontok bleiben. Es bekommt nur zu trinken, aber nichts zu essen. Die Frauen aus nah und fern kommen zusammen und führen um diese Laubhütte Tänze auf. Am zweiten Tage bekommt das Mädchen zu essen; 5 Tage hindurch dauern diese Festlichkeiten, bei denen nur ein einziger Mann als Festleiter zugegen ist. Das Mädchen gilt während dieser 5 Tage als „giftig" und darf nichts anrühren, auch ihre Nahrung nicht, welche ihr von einer alten Frau gereicht wird. Am sechsten Tage geht das Mädchen dann mit einer alten Frau Feldkost suchen, und zurückgekehrt, macht sie selbst Feuer und kocht im Kreise ihrer Gäste zum ersten Male offiziell selbständig. Es ist aber möglich, daß Mädchen schon heiraten, bevor sie diese Zeremonie durchgemacht haben.

Bei den †Aula wird für jedes Mädchen zur Zeit der ersten Menstruation die Mädchenweihe abgehalten. Das gleiche ist bei den Naron der Fall. Jede Nacht, solange die Periode des Mädchens dauert, wird der Elandbull-Tanz getanzt. Zwei alte Männer befestigen wirkliche oder aus Holz gefertigte Elandhörner auf ihrem Kopf und warten im Busche; dann kommt die menstruierende Mädchen und setzt oder legt sich, von alten Frauen umgeben, in die Mitte eines Kreises von jüngeren Frauen, welche einen Tanz aufführen. Die beiden Elandbullen kommen bald, bald verschwinden sie wieder. Der Tanz ist sehr indecent. Bei den Nuesan vertreten als Vögel (!) maskierte Männer die Elandbullen.

Einmal des Jahres, im Herbst, wenn viel Feldkost geerntet wird, ist ein großes Fest. Der Tag heißt: ‖//gam /gna sho (Der große Tag)". Da wird Nahrung vorbereitet und die Buschmänner kommen von allen Seiten zusammen. Es wird getanzt und gesungen, aber man muß zu Hause bleiben, niemand darf jagen, Feldkost suchen oder überhaupt etwas arbeiten.

4. BRAUTWERBUNG, HOCHZEIT UND EHE

Nogau: Will ein junger Buschmann heiraten, so darf er seinen Antrag nicht bei dem Mädchen anbringen, sondern muß mit deren Eltern sprechen, doch ist die Zustimmung des Mädchens zur Ehe notwendig. Ist diese erfolgt, dann werden Geschenke ausgetauscht zwischen den Eltern der Brautleute oder auch ein Gemsbock geschossen und auf beide Familien verteilt. Gleich nachdem die Geschenke ausgetauscht sind, beginnt man mit den Vorbereitungen zur Hochzeit. Ist genügend Wild, vor allem ein Gemsbock zur Stelle, dann wird die ganze Nacht hindurch getanzt und dazu gesungen: „Uooõ, uooõ, õ, ooo, guooõ, guooõ usw."

Fig. 25. Halskette mit Zauberhölzern und Parfümdose eines Mädchens (Nogau).

Dann nimmt der junge Mann seine Gattin und zieht mit ihr zur Horde seines Vaters. Großes Gewicht wird auf Jungfräulichkeit vor der Ehe gelegt. „Das kommt bei uns nicht vor, daß ein Mädchen vor der Ehe geschwängert wird", so versicherte mir wenigstens das Oberhaupt der Horde. Ebenso legt man auf Nachwuchs in der Ehe größten Wert. Während der Schwangerschaft bestehen keine Speiseverbote. Steht die Niederkunft bevor, dann versammeln sich alle Frauen der Horde. Falls Schwierigkeiten entstehen, wird keine Hilfe geleistet, sondern bloß eine Medizin verabreicht.

Der älteste Bruder des Vaters ist das Familienoberhaupt. Die Knaben gehören dem Vater, die Mädchen der Mutter und fallen auch in die betreffenden Familien. Die Bezeichnungen der nächsten Verwandtschaftsgrade sind: Vater: mba; Bruder des Vaters und Familienoberhaupt: mau; dessen Gattin: mama (die Kinder von Vaters Brüdern und Vaters Schwestern nennen sie Geschwister, und zwischen diesen besteht Heiratsverbot); Mutter: aje; Bruder der Mutter: mko; dessen Frau: tooo. Zum Unterschied von den !Kung besteht auch den Kindern der Mutterbrüder und Mutterschwestern gegenüber Heiratsverbot, innerhalb der einzelnen Sippen herrscht strenge Exogamie. Monogamie ist die Regel, doch darf man wie bei den !Kung mit Zustimmung der ersten Frau eine zweite nehmen. Die Ehe ist untrennbar. Für die Witwe sorgt die Familie der Frau, die mit den Kindern zu ihren Anverwandten zieht. Eine Verpflichtung des Schwagers, die verwitwete Schwägerin zu heiraten oder für sie zu sorgen, besteht nicht.

†Aula: Männer heiraten etwa zwischen 16 und 18 Jahren, Mädchen zwischen 13 und 16 Jahren. Beide Angaben beruhen natürlich auf ungefährer Schätzung. Die Werbung wird vom Ehekandidaten

bei der Mutter des Mädchens angebracht. Ist diese nicht mehr am Leben, so vertreten die nächsten Verwandten (Vater, Onkel, Tante) deren Stelle. Der Vater wird erst an zweiter Stelle gefragt. Der Freier bringt den zukünftigen Schwiegereltern Geschenke in Gestalt von Wildbret und Feldkost, manchmal länger als ein Jahr hindurch. Verläuft die Sache glatt, so führt er nach einiger Zeit das Mädchen in seine Hütte, und die Ehe gilt als vollzogen. Weigert sich das Mädchen trotz Einwilligung ihrer Eltern, den Mann zu heiraten (sie ist berechtigt, ihrem Willen Ausdruck zu verleihen, und befolgt durchaus nicht immer den Wunsch der Eltern), so führt der Jüngling das Mädchen schließlich mit Gewalt in seine Hütte. Würde ein Mann ohne Einwilligung der Eltern einem Mädchen Gewalt antun, so würde er getötet werden. Besondere Zeremonien bei der Eheschließung werden nicht vorgenommen. Das vor der Übersiedlung in den Pontok des Mannes vorgenommene Verlöbnis gilt als abgeschlossen, wenn der Mann das Mädchen um das Handgelenk faßt. Da „Verlobung" und „Hochzeit" aber zeitlich nur durch den Marsch nach der Hütte getrennt sind, so kann man das Umfassen des Unterarmes der Braut als Vollziehung der Ehe betrachten. Das Umfassen des Unterarmes geschieht ziemlich gewaltsam, und die Braut läßt sich beim Marsch nach der Hütte etwas ziehen. Eigenartig ist es, wie sich nach der Heirat das Verhältnis des Schwiegersohnes zu seiner Schwiegermutter verändert. Der erstere vermeidet die Gesellschaft seiner Schwiegermutter und sitzt nicht mit ihr zusammen. Wenn er sich dem Lagerfeuer zum Beispiel in der erkennbaren Absicht nähert, sich davor niederzusetzen, so geht die Schwiegermutter fort. Hat er notgedrungen mit ihr etwas zu besprechen, so schreien sie sich gegenseitig auf große Entfernungen an.

Fig. 26. Nogaumädchen im Festschmuck aus Straußeneierperlen (Mädchenweihe).

Vorehelicher Geschlechtsverkehr scheint kaum vorzukommen. Kaufmann hat zwei bis drei Kinder bei den meisten Frauen festgestellt, welche stets etwa 2 oder 3 Jahre auseinander sind.

Bei den Naron wird die Braut formell geraubt, das Wort „Heiraten" bedeutet soviel wie „Fangen". In Wirklichkeit aber gehen diesem Raub Verhandlungen voraus. Die Exogamie ist bei den Naron nur mehr auf die wirklichen Geschwister beschränkt. Nach der Hochzeit zieht das junge Paar zur Werft der Brauteltern und bleibt manchmal jahrelang dort. Bei den Naron kommt übrigens auch Kindesmord vor. Ansonsten hängen aber die Buschmänner mit großer Liebe an ihren Kindern.

5. STAAT UND RECHT

Bei den ǂAuin ist die Häuptlingswürde im Mannesstamme erblich. Das gleiche ist bei den Nogau der Fall. Bei den Naron gibt es eigentlich keine Häuptlinge mehr. Der letzte kam dadurch um seine Autorität, daß er sich vorwiegend als Arbeiter auf den Farmen aufhielt. Bleek glaubt, daß früher ein solcher Häuptling 30–50 Familien regierte. In letzter Zeit hatten alle diese Stämme wenigstens nominell einen Kriegshäuptling.

Bei allen drei Stämmen ist der Begriff des Privateigentums an Gebrauchsgegenständen sehr stark ausgeprägt, und auf Diebstahl steht die Todesstrafe. Jede Sippe ist Eigentümerin eines bestimmten Landstriches. Nicht überall sind in diesem ebenen Gebiete die Grenzmarken deutlich, so daß ein Überschreiten derselben nicht jene schweren Folgen hat wie im Norden. Wer dagegen ein Wild findet, das unter dem Pfeilgift verendet ist und welches er nicht selbst geschossen hat, der darf nichts davon nehmen. Das Feldkostsammeln ist überall gestattet. Wer dagegen einen Honigstock findet, macht dort ein Zeichen, und dieser ist nunmehr sein Privateigentum geworden. Bei den ǂAuin brennen die einzelnen Buschmänner Feldstücke ab, und alle Feldkost, die dort wächst, gilt als sein Privateigentum.

Die Fehden, die zwischen einzelnen Sippen bestehen, werden als Krieg bezeichnet; da aber eine Rechtsahndung praktisch nur gegenüber Angehörigen anderer Horden geübt wird, so bedeutet jede

Geltendmachung des Rechtes auch Krieg. Bei den Nogau wird der Krieg feierlich durch Boten angesagt.

Bevor man in den Krieg zieht, schmiert man sich mit einer Zaubermedizin den Körper ein (/num). Handelt es sich um alte Feinde, so wird der Überfall hinterlistig ausgeführt. Ansonsten stellen sich die Feinde zum offenen Kampf. Je nach dem Grade der Feindschaft wird entweder mit vergifteten oder unvergifteten Pfeilen aufeinander geschossen. Häufig aber findet vor Beginn des Kampfes noch eine Unterredung der Führer statt, die dazu führt, daß man in Frieden auseinander geht. Die Grundsätze der natürlichen Moral werden innerhalb und außerhalb der Horde geachtet und anerkannt. Es gilt als schlecht, einem anderen Menschen Böses zu tun oder ihm in der Not nicht beizustehen, nicht weil man irgendeine Strafe zu befürchten hätte, sondern weil es die Alten so gelehrt haben.

6. DAS WELTBILD UND DIE RELIGION

Die Sonne ist ein Mann und heißt /gam bzw. kha//a`, der Jäger. Der Mond ist eine Frau und heißt hui bzw. /nanga, „die Herumlaufende".

Früher haben die Sonne, der Mond und der Hase zusammen gewohnt. Eines Tages hatte Frau Mond und Herr Hase Streit. Der Mond hat dem Hasen mit einem Beil die Schnauze auseinander geschlagen. Der Hase hat den Mond dann im Gesicht zerkratzt. Das sieht man noch heute. Als die Sonne heimkam, wurde sie böse und sagte: „Jetzt haben wir genug von der Erde, jetzt gehen wir hinauf, damit der Hase allein bleibt. Von oben werde ich ihn brennen, und ich werde sehr heiß werden, damit er tags nicht herumlaufen kann, wie er will." Darauf erwiderte der Mond: „Es ist gut so, ich gehe nachts und bringe die Kälte, so daß der Hase friert, wenn er sein Futter sucht."

Seit dieser Zeit sind Sonne und Mond am Firmament.

Das Himmelsgewölbe besteht aus den Decken von Sonne und Mond. Als Sonne und Mond zum Himmel hinauf gingen, hatten sie Säckchen mit Harz bei sich. Die warfen sie weg. Diese Harzkörner sind die Sterne.

Als Sonne, Mond und Hase noch beisammen waren, da sagte die Sonne: „Die Menschen sollen nicht sterben", und der Mond stimmte ihr bei. Aber der Hase sagte: „Nein, die Menschen müssen sterben, weil ich auch sterben muß."

Der Regen wird von Zauberern gemacht, diese heißen Gowa. Sie sterben nicht, sind aber sonst wie andere Menschen, haben aber schwarze Haut. Wenn kein Regen kommt, dann machen die Buschmänner ein großes Feuer und werfen eine Wurzel „He" und eine männliche Schildkröte hinein. Sobald es zu regnen anfängt, dann tanzen sie und schlagen sich dabei auf die Schenkel und singen dazu: „Ehe, ehe, ehe, ije, ije, ije, ehe, ehe, ehe usw." Die Zauberer können sich in Löwen verwandeln.

Der Regenzauberer wohnt auf der Erde, wie andere Menschen wohnen. Der Regenbogen ist der Regenhund. Die Wolken sind die Regenhaare.

Wenn Neumond ist, dann sagen sie, der Mond schläft. Die Sonne läuft des Nachts wieder nach Osten zurück.

Donner und Blitz macht nicht der Regen, sondern Gauab, der bei diesen Buschleuten zu einer Personifikation des Bösen geworden ist. Der Blitz heißt: „Gauabs Messer".

Der dunkle Nachthimmel sind die Decken von Mond und Sonne. Das Himmelsgewölbe heißt /gna. Meine Gewährsmänner ließen die Frage offen, ob nicht vielleicht die Sonne „der Größte sei", welcher alles gemacht hat. Andererseits wird aber Khu ebenfalls als der Schöpfer angesehen. Er hat Himmel und Erde gemacht, und er macht auch die Menschen lebendig. Khu ist kein menschliches Wesen, er ist gut, aber Näheres weiß man nicht von ihm. Er greift auch nicht weiter in den Lauf der Welt und des Menschenlebens ein. Zwar sagen sie: „Khu ist der Größte und Gauab ist der Kleinste", aber Gauab spielt in ihrem Leben doch eine größere Rolle. Er gebietet über Donner und Blitz, er jagt, allen sichtbar, als zerstörende Windhose durch die Steppe, und er tötet die Menschen auch, indem er ihnen die Seele herausreißt und einen kleinen Gauab daraus macht, der seinerseits im Busch herumläuft und allerhand üble Dinge treibt.

Bei den Naron besteht im geheimen ein Mondkult. Man bittet den Neumond um Regen. In alter Zeit sollen auch bestimmte Sterne, besonders der Morgenstern und das südliche Kreuz, das sie Feuerschuh nennen, angerufen worden sein. Die Geschichte vom Mond und dem Hasen wird folgendermaßen erzählt: Der Mond sagte: „Die Leute sollen sterben und wieder aufstehen, wie ich sterbe und auch wiederum zurückkomme." Aber der Hase widersprach und meinte, die Leute sollten tot bleiben. Da wurde der Mond böse und zerschlug dem Hasen mit einer Hacke das Maul.

„Der Mond ist ein alter Mann und die Sonne ein junges Mädchen, seine Frau. Zuerst geht der Mond unter den Himmel, dann folgt die Sonne hinter ihm her. Sie gehen in ihre Hütten, die sich unter dem Horizont im Westen befinden. Bei Nacht bzw. bei Tag gehen sie zu ihren Hütten im Osten zurück; man kann sie hören, aber nicht sehen."

Kaufmann konnte über die Hochgötter der †Auin nichts Konkretes in Erfahrung bringen. Über die Naron erzählt Bleek, daß bei ihnen eine eigentümliche Mischung religiöser Vorstellung Platz gegriffen habe. Eine gewisse Zentralstellung nimmt bei ihnen Hise oder Hyoa ein, der von den erwachsenen Männern mit !Khuba oder ǂx'uba bezeichnet wird. Die alten Leute wußten nichts davon. !Khub bezeichnen die Nama als Meister oder Herr, und dieses Wort wird von manchen Missionaren für Christus gebraucht. Diese Alten behaupten, dieser Begriff sei von den Nama übernommen worden. Früher kannte man nur Hise, dieser wohnte im Osten. Hise ist offenbar dasselbe wie Heitsi Aibib (wörtlich „Der erste Baum").

Die Naron erzählen, daß in alter Zeit sowohl die Bäume wie die Tiere Menschen waren, die von Hise in ihre jetzige Gestalt verwandelt wurden. Dann rief Hise die Häuptlinge der Weißen und Schwarzen und sagte zu ihnen: „Nehmt Rinder und Ziegen und lebt mit ihnen." Zu den ersten Häuptlingen der Buschmänner aber sprach er: „Nehmt die Antilopen und lebt von ihnen, macht Fallen und jaget und lebet im Busch."

Der Ausdruck Huwu oder Huwuba ist bekannt und soll den großen Kapitän der Männer im Norden bezeichnen. Interessant sind die Ausführungen von Miß Bleek über //Gauwa. Nach der Meinung der Naron und †Auin ist //Gauwa der Geist eines verstorbenen Menschen. Medizinmänner können diese Geister auch sehen, die Weiber können sie nur hören. Manche Frauen erklärten, daß nur Männer, welche die Initiationszeremonie durchgemacht haben und die zwei Narben zwischen den Augenbrauen haben, //Gauwa werden können. Aber auch ein stärker, heulender Wind wird als //Gauwa bezeichnet. Einige Individuen glauben auch an einen Obergeist dieses Namens, der in der Nähe Hises im Osten wohnt, zu dessen Hause die Geister bei Tage zurückkehren. Manche bezeichnen //Gauwa als den jüngeren Bruder Hises, andere identifizieren ihn mit diesem.

Die Naron geben Hise bald männliche, bald weibliche Endungen. Bei den †Auin erscheint dieser während ihrer Tänze bald als Mann, bald als Frau.

7. MEDIZIN

Der Heilschatz der Nogau-Buschmänner ist sehr primitiv. Sie haben kein Mittel gegen Schlangenbiß und keines gegen das Pfeilgift.

Elandfett ist eine Universalmedizin. Bei den häufigen Augenentzündungen wird dieses Fett ins Auge geschmiert, bei Kopfschmerzen wird warmes Elandfett ins Ohr geträufelt, bei Schnupfen werden die Nasenlöcher und die Nase mit Elandfett eingeschmiert.

Die Krankheiten kommen entweder vom bösen Obergauab oder auch von Zauberern. Die Krankheit wird durch einen kleinen Gauab hervorgerufen, der sich im Körper festgesetzt hat. Je schwerer krank einer ist, um so mehr Gauana sind in ihn hineingefahren. Die Doktoren können diese Krankheitsgeister herausziehen, sie tun das in analoger Weise wie die !Kung. Auch Doktorinnen gibt es.

Die Krankheitsgeister werden hier viel materieller gedacht als bei den !Kung, so ein Gauab sieht aus wie ein Mensch, er kann aber auch als Löwe, als Wildebeest oder als Schlange erscheinen. Ist der Gauab aus dem Körper herausgezogen, dann läuft er weg und spricht mit niemandem.

Speziell die Zauberer verwandeln sich gerne in Löwen. Bei den Buschmännern weiter im Norden

soll es vorkommen, daß sie im Busch beispielsweise ein Wildebeest sehen; das ist aber gar kein Wildebeest, sondern ein Gaua. Die Doktoren erhalten ihre Kraft vom obersten Gaua (/gaua //gaicha). Es ist derselbe, der in der Windhose erscheint. Die Doktoren müssen ähnlich wie bei den Bantu bei älteren Fachkollegen mehrere Jahre in die Schule gehen. Sie können nicht nur heilen, sondern auch im bösen Sinne zaubern, indem sie /Gaua //gaicha bewegen, einen Menschen krank zu machen, dem sie schaden wollen.

„Wer Zauberer werden will, der muß bei einem anderen Zauberdoktor in die Schule gehen. Wenn jemand vom Blitz getroffen wird, so sagt man, Gaua hätte ihn mit seinem Messer geschlagen. Manche werden dann große Doktoren und sprechen viel mit Gaua. Gaua kommt auch als Windhose."

Bei den Naron ist nach Bleek auch der Buschmannrevolver im Gebrauch. Damit kämpfen die Doktoren untereinander. Man schießt heimlich einen solchen Pfeil auf den Kraal des Gegners, und durch den Zauber, der von dem Pfeil ausgeht, erkrankt der Feind und stirbt.

8. TOD UND BEGRÄBNIS

Bei den Nogau bestehen folgende Anschauungen: Der Tod wird dadurch herbeigeführt, daß Gaua die Seele stiehlt und einen kleinen Gaua daraus macht. Der Tote wird sogleich begraben, es wird nicht getanzt, sondern geweint. Die Leiche wird in Hockerstellung zusammengebunden und auf der Seite, mit dem Kopfe nach Osten, bestattet. Bloß die Schlafdecke wird mitgegeben, die hinterlassenen Waffen behalten die Brüder. Die Kost, die der Tote bei sich getragen hat, wird auf das Grab geworfen. Dann kommen Büsche darauf.

Nach ihrer Meinung treibt sich die in einen Gaua verwandelte Seele des Toten beim Grabe herum, darum sieht man von dannen. Kommt ein Nogau-Buschmann bei dem Grabe eines Stammesgenossen vorbei, dann bittet er ihn um Hilfe bei der Jagd, damit die Kinder schnell wachsen und dick werden. Er sagt:

„Ich weiß nicht, wie es mir gehen wird
Mit dem Essen, wie es mir gehen wird mit dem Essen;
Ich weiß nicht, was ich machen soll, daß ich etwas zu essen bekomme,
Laß uns essen und groß werden."

Allerdings besteht auch der Glaube, daß der große Gaua, der den Menschen tötet, dessen Herz frißt oder in kaltem Wasser aufhebt und schließlich einen neuen Buschmann daraus macht. Bei den Naron wird der Leichnam in Hockerstellung zusammengebunden und mit dem Gesicht nach Osten in Seitenlage bestattet. Am Tage nach dem Begräbnis streuen die Leidtragenden Buchupulver auf die Grabstätte. Diese Sitten werden aber keineswegs immer eingehalten, speziell dann, wenn der Boden hart ist. Die Naron fürchten die Geister der Verstorbenen nicht. Doch sehen die Doktoren die Totengeister und ebenso jene Männer, „die zwischen den Augenbrauen Einschnitte haben". Das sind, wie wir von den Nogau wissen, alle, welche die Jugendweihe mitgemacht haben. Frauen können solche Geister niemals sehen.

Bei allen drei Stämmen kommt es vor, daß alte Leute ausgesetzt werden.

9. DIE JAGD

Die West-Kalahari ist auch heute noch ziemlich wildreich, so daß der Lebensunterhalt durch die Jagd wenigstens einigermaßen erzielt werden kann. Vor der Jagd verreibt man eine Tamanafrucht (tse) im Gesicht. Sie suchen auch die Kräfte des Wildes durch Impfung in sich aufzunehmen. Wenn etwa ein Steinbock zur Strecke gebracht ist, dann nimmt man ein Stückchen Herz, einen Ausschnitt des Ohres und verkohlt diese. Man verreibt diese Tierkohle dann in den Einschnitt am Oberarm. Sowohl im Krieg als auch auf der Jagd verständigt man sich durch Rauchsignale. Die Hauptjagdwaffe

ist der Bogen mit dem Giftpfeil. Das Gift[1] wird aus den Kokons einer Käferlarve gewonnen, die auf den Wurzeln einer Akazie lebt. In einem Antilopenhorne trägt der Buschmann mehrere dieser Kokons wie Patronen mit sich. Soll die Pfeilspitze vergiftet werden, dann wird ein Feuer angemacht, etwas von dem Akazienharz, das der Buschmann immer bei sich trägt, auf der Pfeilspitze verschmiert und sodann ein Kokon zerbrochen und sein Inhalt auf der Pfeilspitze verrieben. Bei dieser Gelegenheit hatte einer meiner Buschleute eine kleine Wunde am Daumen, durch die das Gift eindrang, übersehen. Das Eindringen des Giftes war nicht sehr schmerzhaft, er hatte nur das Gefühl „als würde warmes Wasser in sein Fleisch eindringen". Der Arm war eine Woche lang dick geschwollen. Die anderen machten ihm zahlreiche Einschnitte und Skarifikationen mit glühenden Hölzchen, und so konnte er gerettet werden. Das Fleisch der so getöteten Tiere ist roh genossen, giftig.

v. François[2] berichtet, daß die Hei//om dieser Gegend ihr Gift aus dem Milchsafte der Apocynacee Adenium Boehmianum bereiten. Dieses wird an der Sonne zuerst violett und dann schwarz. Es wird in kleinen Ledersäckchen aufbewahrt und im Bedarfsfalle erwärmt und mit dem Safte der Habaswurzel vermengt und mit flachen Stäbchen auf die Pfeilspitzen gebracht. Diese Buschmänner bedienten sich noch gerillter Steine zum Richten des Pfeilschaftes.

Der kleine Bogen (!naru) wird aus dem //ne-Busch gemacht und ist viel kürzer als der der !Kung. Der Pfeil und die Pfeilspitze heißen tschi. Sie haben sowohl Pfeile mit Eisenspitzen wie die !Kung, wie auch solche aus Knochen. Die beigefügten Figuren mögen die beiden Typen erläutern, die von anderen Autoren bereits hinlänglich beschrieben wurden. Die in älteren Sammlungen befindlichen Pfeilspitzen, auf denen das Gift nicht nur an der Spitze, sondern auch auf dem Schaftstück in strich- oder punktförmigen Klümpchen aufgetragen ist, sind jetzt nicht mehr in Verwendung. Auch die Bogen der Naron sind klein, und auch sie haben zweierlei Pfeile. Die Pfeilschäfte sind aus Rohr, das nur an wenigen Stellen verwendet wird. Außerdem haben alle diese Stämme Wurzelstockkeulen. Speere (Kuku) werden von den Owambos gegen Straußeneierperlen eingehandelt. Bleek schreibt

[1] Lewis hat den Buschmanngiften mehrere Studien gewidmet (Pfeilgifte der Buschmänner. Zeitschrift für Ethnologie, Bd. 44. 1912.

„Als ich die ersten mit Gift bewehrten Pfeile, die Lichtenstein von seiner Reise im Jahre 1806 heimgebracht hatte, und die im hiesigen Museum für Völkerkunde aufbewahrt werden, untersuchen durfte, konnte ich feststellen, daß in dem Gifte Alkaloid sei, dem anfangs erregende, später lähmende Wirkungen auf Rückenmark und Gehirn zukamen. Wegen der Geringfügigkeit des Materiales war ich auf eine eigenartige Farbenreaktion, die das aus dem Gifte isolierte Alkaloid mit konzentrierter Schwefelsäure lieferte, nirbts weiter feststellbar.

Es ist mir nun gelungen, aus der Zwiebel von Haemanthus toxicarius, der „gift bul" der alten holländischen Kolonisten, das wirksamste Prinzip, ein Alkaloid, darzustellen, das chemisch und toxisch mit dem wirksamen Prinzip des von Pfeilen abgenommenen Giftes übereinstimmt. Ich gab ihm den Namen Haemanthin.

Nach der subkutanen Beibringung der aus den 6–7 mm langen Blepharida-Larven isolierten wasserlöslichen Eiweißkörper bei Tieren stellen sich die Bewegungsstörungen ziemlich schnell ein. Futter wird nicht mehr aufgenommen. Tauben bekommen danach Erbrechen und, gleichwie auch Kaninchen, Durchfälle. Sie werden ruhig, hocken bewegungslos, die Lider, die sich eine Zeitlang fast unaufhörlich bewegten, nehmen schließlich an der Schwerbeweglichkeit bzw. Bewegungsunfähigkeit teil. Die Augen sind geschlossen. Die Tiere verfallen dann in einen schlafartigen Zustand und gehen nach oft erst vielen Stunden unter Atmungsstörungen zugrunde. Bei der Sektion werden Veränderungen in der Niere gefunden."

Eine Übersicht über die Giftpflanzen Südafrikas hat J. M. Watt gegeben. Als Medizinalpflanzen werden in Südafrika über 500 Arten verwendet und 150 gelten als gefährliche Giftpflanzen. Die meisten der bisher bekannten Giftpflanzen haben eine Wirkung nach Art des Digitalis. Hierzu gehören ja auch die alten Pfeilgiftpflanzen der Buschmänner Acokanthera venenata und spectabilis, welche von Moir, Lewis und Curson genauer untersucht wurden. Auffällig ist, daß das Gift eine außerordentlich chemische und physikalische Stabilität hat. Zur Vergiftung per os wird von den Eingeborenen öfter Buwela vulgaris verwendet.

von den Naron, sie hätten früher überhaupt keine Hunde gehabt, und auch von den ǂAuin meldet Kaufmann, daß sie sehr wenig Hunde hätten. Die Nogau hatten allerhand Köter, aber keine originelle Rasse. In diesem Zusammenhang seien zwei Tiergeschichten erzählt:

1. Ein großer Vogel hat einen Steinbock getötet. Da kam die Hyäne und nahm den Steinbock. Die Hyäne begegnete dem Schakal. Der Schakal sagte: „Hyäne, du sollst nicht dorthin gehen, wo du hingehen willst, es wird dir sonst übel ergehen!" Die Hyäne ging aber doch, da kam der große Vogel (!gui) und band der Hyäne die Füße zusammen und machte bei den Füßen ein Feuer. Seitdem hat die Hyäne schwarze Beine und wagt nicht etwas Lebendes zu töten. Aber auch der Schakal ging stehlen, da packte ihn der große Vogel und hielt ihn mit dem Rücken über das Feuer, seitdem hat er einen schwarzen Streifen über den Rücken.

2. Der Löwe kam zur Wasserstelle, da kam der Frosch aus dem Wasser und verhöhnte den Löwen. Dieser wollte ihn töten, kratzte ihn aber nur auf dem Rücken; der Frosch sprang schnell wieder ins Wasser, aber seitdem hat er schwarze Streifen auf dem Rücken.

10. KLEIDUNG UND SCHMUCK

Die Kleidung des Mannes besteht aus der Mütze, aus dem Fell des Schakals, des Springhasen oder des Duikers, dem Lendenschurz, Sandalen und der Felltasche. Im allgemeinen unterscheidet sich die Kleidung dieser Buschmänner nicht wesentlich von der des Nordens. Nur besitzen sie weit mehr Straußeneiperlen als jene.

11. WAFFEN

Die ǂAuin besitzen die Wurflanze, der Grabstock wird gelegentlich auch zum Schlagen und als Wurfkeule benützt. Die Lanzenspitzen werden vom Ngami-See eingehandelt. Der Schaft ist am oberen Ende mit einem Streifen von Antilopenhaut oder Sehnen umwickelt. Der Schaft verjüngt sich gegen das Ende zu. Die Lanzenspitzen werden in männliche und weibliche eingeteilt. Die männlichen haben stumpfe Widerhaken. Die Spitze wird öfter mit einer Lederkappe versehen. Die Lanzenspitzen dienen zugleich als Messer und Universalinstrument. Die Speerspitzen werden gut versteckt gehalten. Bei den Naron sind Speere heute sehr selten, sie werden aus Owamboland im Tausche gegen Straußeneiperlenketten erworben. Das gleiche gilt von den Nogau, die allerdings die Speerspitzen teils von den Owambos, zum Teil auch auf dem Umwege über die !Kung vom Okawango beziehen.

Fig. 27. Pfeile der Nogau.

Der Bogen der ǂAuin ist klein; die Sehne ist aus Tiersehnen gedreht und auf einer Seite aufgeschoben, auf der anderen befestigt. Die Pfeile werden aus Schilfrohr hergestellt. Am Grunde des Schaftes befindet sich eine flache Einkerbung, das Ende ist mit Gras umwunden. Ebenso finden wir am oberen Ende eine Einkerbung, wo die Spitze eingesteckt wird. Die Länge des Pfeilschaftes beträgt 48–52 cm. Die Spitzen sind entweder aus Eisen oder aus Bein, wozu Straußenknochen gebraucht werden. Die knöcherne Pfeilspitze geht in zwei Enden aus, deren eines in das Schaftrohr gesteckt wird, während das andere vergiftet ist. In anderen Fällen ist die kurze Pfeilspitze durch ein Verbindungsstück aus Gras mit einer Knochenspindel verbunden, die dann ihrerseits im Schaft fixiert wird, so daß der Pfeil dreiteilig ist. Die Pfeile werden entweder montiert im Köcher getragen, oder die Spitzen

werden in kleinen Behältern aus Rinde oder Horn aufbewahrt, die beiderseits durch Lederkappen verschlossen sind. Drei Bogen der Nogau hatten Längen von 89, 95 und 100 cm. Tiersehnen sind verwendet.

Der Kampfschild der †Auin ist eine Kriegsmütze aus dem Felle des Erdwolfs. Der Bogen der Naron ist aus dem Holze der Grevia gemacht und ca. ein Meter lang. Zur Bespannung werden nicht nur Sehnen, sondern auch Fasern aus dem Pflanzenreich verwendet. Die Pflanzenschnüre sind ein Surrogat, zu dessen Verwendung die Buschmänner heute durch den Wildmangel genötigt werden. Der Bogen selbst wird an seinen Enden durch Umwickelung mit Sehnen oder Leder verstärkt.

Fig. 28. Bogen der Nogau (½ n. Gr.).

Die Pfeilschäfte gleichen denen der †Auin, ebenso die Spitzen. Die Eisenspitzen sind nicht abnehmbar und werden männliche genannt. Das Metall wird aus dem Norden bezogen und auf kaltem Wege von den /Auin zubearbeitet. Die Naron selbst machen keine Eisenpfeilspitzen.

Während zu Kaufmanns Zeiten die /Auin noch keine Kirri hatten, besitzen die Naron heute solche, und zwar ist das untere Ende zugespitzt, damit man ihn auch als Grabstock verwenden kann. Die Nogau besitzen, wenn auch nicht häufig, Wurfkeulen, die denen der Damara und Herero entsprechen, jedoch roher gearbeitet sind.

Bleek erwähnt von den Naron auch die Harpunen mit langen, zusammengesetzten Schäften, die dazu dienen, Springhasen und dergleichen aus ihren Löchern herauszuholen. Dieses Werkzeug wird bei den Damara näher beschrieben werden.

Feuer machen die Nogau wie alle Buschmänner durch Reiben mit zwei Hölzern aneinander. Das weibliche Holz heißt Dane-di, das männliche Dane-/goa. Das Feuermachen selbst wird als Dalisi bezeichnet, eines der zahlreichen fremdartigen Worte, die wir bei den Nogau finden und die keine Klixe haben.

Buschmannbrunnen sind ebenfalls im Gebrauch und heißen //a-si.

Die Mädchen haben ein Spielzeug (gai-dum), das aus mehreren verschiedenartigen Hölzchen besteht, welches sie auf der Brust tragen. Sie klappern mit den Fingern darauf.

Fig. 29. Wildfalle. (Nach Gentz, Globus, Bd. 83, 1903.)

Der Löwe wird weder gegessen noch gejagt. Schakal und Leopard werden gegessen, vom letzteren auch die Leber. Paviane werden nicht gegessen, weil diese früher Buschmänner waren.

Die Strichtatauierung zwischen den Augenbrauen macht die Leute bei den Nogau zu Leoparden. Die Naron beschmieren sich mit roter und schwarzer Farbe. Die anderen Einritzungen und Tatauierungen werden bloß zu Verschönerungszwecken gemacht.

Bei den Naron werden die Tausendfüßer als Geschöpfe des Hise angesehen, und nur Doktoren dürfen sie anrühren und machen Medizin daraus. Bei den Nogau und †Auin gibt es Zauberknochen, die zur Vorhersagung der Zukunft dienen. Auch die Naron glauben, daß die Felsgravierungen von //gauwa stammen.

Bei den Auin ist es verboten, Hyänenfleisch zu essen und ebenso das Fleisch des Schabrakenschakals, weil dieser ein Hund ist.

Nachzutragen sind die folgenden wichtigen Angaben von Gents[1]:

„Ich habe wiederholt auch Buschmannpelle gefunden, an denen die sonst aus Knochen (meist Straußenknochen) gefertigte Spitze aus Holz bestand. Die Konstruktion der in Fig. 29 wiedergegebenen Wildschlinge ist folgende: Eine etwa 4–5 mm starke Schnur, die an einem Ende in eine einfache Schlinge ausläuft, wird mit dem anderen Ende an einem stark abwärtsgebogenen elastischen jungen Baum oder Zweig befestigt. An dem mit der Schlinge versehenen Ende der Schnur ist eine kleine dünnere Schnur mit einem Querhölzchen angebracht. Die Schnur wird um einen schräg in die Erde getriebenen kleinen Pflock gelegt und durch ein gegen das freie Ende des Querhölzchens gestemmtes, flaches, unter dem Boden eingegrabenes Holz, über welches die Schlinge kreisrund auf den Boden gelegt wird, am Abgleiten verhindert. Das Wild, das seiner gewohnten Bahn zur Wasser- oder Brak-(Sals)-Stelle folgt und durch abgeschlagene und zu beiden Seiten der ausgetretenen Bahn gelegte Dornzweige am Abbiegen von der Spur verhindert wird, tritt auf das dicht unter dem Boden liegende Stäbchen, das dadurch aus seiner Lage kommt und das Ende des kleinen Querhölzchens fahren läßt. Die Schnur, die nun ihren Halt verloren hat, läßt den umgebogenen Baum frei, der zurückschnellend die an dem Bein des Wildes seinen Halt findende Schlinge zuzieht und das Tier gefangen hält, bis der Buschmann es mit einer Anzahl Schläge seines aus hartem Holz geschnitzten Kirri auf grausame Weise vom Leben zum Tode fördert. Für die verschiedenen Hühnervögel, Tauben usw. fertigt der Buschmann ähnliche Schlingen aus dünnerer Schnur an, die ebenso aufgestellt werden, mit dem Unterschiede, daß hier die Schlinge nicht auf den Boden gelegt wird, sondern durch kleine, in einem Kreise in den Boden gesteckte Stäbchen etwa 2–3 cm über dem Boden gehalten wird. In die Mitte des Kreises, auf das lose mit Sand bedeckte Stäbchen, werden einige Maiskörner oder Beeren gelegt. Sobald der betreffende Vogel diese aufpickt, bringt er das Stäbchen aus seiner Lage und sitzt mit dem Hals in der Schlinge. — An Hausgeräten fand ich bei den Kalahari-Buschleuten außer den zum Wassertransport dienenden hohlen Straußeneiern noch aus dem inneren Bauchfell eines Tieres hergestellte, einer Schweinsblase nicht unähnliche Wasserräche, die an der Öffnung durch einen Holzknebel und Lederschnur verschlossen werden. Die Straußeneier dienen den Buschleuten auch zur Anlage künstlicher Wasserstellen in den Durststrecken der wasserarmen Steppengegenden, indem eine Anzahl derselben unter dem Sande verborgen wird.

An Hausgerät fand ich bei den Buschleuten noch flache, hölzerne Schüsseln, hölzerne Mörser und irdene Töpfe verschiedener Größe. Die Holzschüsseln, die in der Form vollständig verschieden sind von denen der Hereros, handeln sie nach ihrer eigenen Angabe von ihren nördlichen Nachbarn ein. Die irdenen Töpfe sind jedenfalls auch nicht von den Buschleuten selbst angefertigt. Sie erinnern in der Form etwas an die hölzernen Omeiratöpfe der Hereros und werden, wie mir ein Hererobastard erklärte und vormachte, folgendermaßen fabriziert. Ein Klumpen weichen und durchgekneteten Tons wird über das nackte, angefeuchtete Knie gestrichen, so daß er zunächst dessen Form annimmt. Dabei muß, um die richtige Form zu geben, der Unterschenkel dicht an den Oberschenkel gepreßt werden. Dann wird die Tonmasse vorsichtig abgestreift und die Form des Gefäßes durch Kneten mit den Fingern verbessert und vervollständigt. Schließlich werden mit einem Holzstäbchen einfache Verzierungen hineingeritzt. Eine Drehscheibe kennen die Hereros nicht, bei denen diese selbstgefertigten Tontöpfe außerdem schon meist durch eingeführte europäische Eisentöpfe verdrängt sind."

000 Anthropological, Ethnological, and Ethnographic Observations concerning the Heikum and Kung Bushmen (1), with an apdix on the languages of these Bushman Tribes (2).

1. Presented at the session of November 18, 1905 /of the Berliner Gesellschaft für Anthropologie, Ethnologie und Urgeschichte/.

121 2. The linguistic notes on the language of the Heikum Bushmen were gathered on the Omuramba Omatako, while the linguistic notes concerning the Kung Bushmen were taken down in a Kung settlement on the northern edge of the Kaukau Veld, approximately 15 kilometers west of Dobe.

A stay of several months in the vicinity of a Bushman settlement near Otjomavare, a watering place on the Omuramba ua omatako, about 50 kilometers south of Grootfontein and 120 kilometers northeast of Waterberg, gave me the opportunity to make a series of observations on the Bushmen, which, I believe, in part presents new information and in part complements and confirms what is already known. My first concern was to determine the size of the Bushmen, who are traditionally known as abnormally small, by obtaining absolute measurements. A closer acquaintance with this interesting people then led me to make further investigations that will be of interest to the ethnologist and the ethnographer.

I had to manufacture in part the instruments needed for making the anthropological measurements, but I hope that this circumstance has not diminished the accuracy of the results.

101 The Bushmen concerned call themselves "Heikum" people, a
[194] name in which the 'k' is to be replaced by the click indicated in
124 the Nama language by //. Thirty-one adults and eight children were measured.

Of the adults 14 are men and 17 women.

128 I shall first present the average values of the absolute measurements, and then a number of proportional figures and indices.

/241 cont./

128 Tables giving all the /242/ measurements for each individual, are attached, as are forms for the observations concerning the descriptive characteristics of the individuals measured.

141 The average values for the adults measured are as follows:

	Men	Women
1. Body height	155.3	149.7
2. Height of the chin above the ground	135.7	130.6

[142] [291] [301] [342] [516]

Fig. 1. Heikum Bushmen. Men.

3. Height of the navel above the ground	93.2	90.4
4. Height of the upper edge of the symphysis above the ground	82.2	79.6
[Fig. 1 appears here.]		
5. Height of the acromion above the ground	130.5	124.9
6. Height of the elbow joint above the ground	99.9	96.5
7. Height of the projection of the radius above the ground	76.0	73.4

/242 cont./	Men	Women
141 8. Height of the tip of the Middle finger above the ground	59.0	56.8
9. Height of the ridge of the ilium above the ground	95.9	93.2
10. Height of the spine of the ilium above the ground	90.1	86.7
11. Height of the knee joint above the ground	43.3	41.2
12. Height of the inner ankle point above the ground	6.4	5.5
13. Height above the ground of the spinal process of the seventh neck vertebra	136.2	129.6
14. Width of the shoulders (acromion distance)	31.1	30.0
15. Distance between the two spines of the ilium	18.4	17.7
/243/		
16. Width between the two ridges of the ilium	21.9	20.9
17. Width between the trochanters	25.5	25.4
18. Circumference of the thorax at the level of the arm pits	76.1	69.3
19. Circumference of the waist	75.7	72.9
20. Circumference of the upper thigh	41.6	40.5
21. Circumference of the calf	28.6	26.5
22. Height of the crown of the head above the seat	77.0	75.6
23. Length of the skull	17.9	17.8
24. Width of the skull	13.6	13.1
[Fig. 2 appears here.]		
25. Diameter of the skull from the crown to the protuberance of the back of the head	16.3	15.7
26. Width between the projection of the two cheek bones	12.2	12.1
27. Width between the outer corners of the eyes	8.5	8.5

	IV. Physiognomic nose index	102.5	97.44

147 [146] The state of nutrition of those examined may in general be called inadequate, and the amount of fat slight. Even among younger individuals the skin is strikingly slack and can be grasped in wide folds. One has the impression that there is a connection between this slackness of the skin and the extreme fluctuation in the saturation of the tissues, which is the rule since the Bushmen experience frequent and long-lasting thirsts. The men assured me that they could march without water for four days in great heat, a statement which surely deserves to be credited.

142 The skin color of all those examined, with the exception of two in whose case racial mixture is a possibility, is a brown of medium tone shading over into yellow.

The palms of the hand and soles of the feet are a lighter color, but do not show such a striking contrast with the back of the hand as is the case among the Bantu /245/ Negroes. The skin of the chest and abdomen has a slightly darker coloration than that of the face. Scars are very common, especially on the chest and abdomen, and [513] usually stem from burns to which the Bushmen readily expose themselves by sitting and sleeping near the open fire. These scars have a lighter tinge than the surrounding skin and look almost pure yellow.

The iris of all those examined is deep brown in color.

Compared with Europeans, the hair growth of the Bushmen is very modest. It is confined almost entirely to the skull; beards are found only on a few men and even then they are sparse. Hair elsewhere on the body, including the arm pits and pubic hair, is practically nonexistent.

The color of the hair on the head is a deep black. The individual hairs grow to a length of about four centimeters for men and about six centimeters for women. The hair is fine and curled in a spiral. The curvature radius of the spiral amounts to about two

/245 cont./

142 millimeters. Two or three hairs form a tight unit. A number of such units are clustered into a tuft that forms an almost impenetrable tangle of hair. The yellowish-brown skin of the head is visible between the tufts, so that the surface of the skull gives the impression of an area with black spots. Extensive variations are
302 to be found in the manner of dressing the hair, but all Bushmen from time to time have their head hair cut. The women commonly leave an edge of longer hair uncut and let it fall horizontally toward the back from the hairline on the forehead. Frequently also an oval area is shaved on the skull or on the edge of the forehead down to the ears.

145 I did not observe any loss of hair, even among old persons, but I did notice graying, not, however, to the same extent as among Europeans.

304 Tattooing is very popular among the Heikum Bushmen.

I found three types of tattooing:

1. An ornamental tattoo. This consists of parallel longitudinal incisions about one centimeter in length and arranged in rows. These rows of incisions are to be found predominantly on the face, on cheeks, temples, and foreheads, and especially among women they frequently radiate towards the middle of the face which, however, is left clear. The ornamental tattoo is also to be found on other parts of the body at any number of places, such as the chest, the abdomen, the upper arm, and the upper thigh. The incisions are quite superficial and give the appearance of fine black lines. The bluish-black coloration of the scars is achieved by rubbing charcoal into the freshly-made incisions.

2. Deeper incisions, which correspondingly leave heavier scars, form the forehead tattoo which is common to all Heikum Bushmen with no age or sex distinctions. The tattoo consists of several parallel vertical incisions about two centimeters in length between the eyebrows. As a result of this tattoo there is a number, usually five, of deep and closely adjoining folds between the eyebrows, giving even younger individuals an older appearance. In the case of older persons the base of the scars /246/ is raised by the formation of keloids, so that the region between the eyebrows has the appearance of a cock's comb.

/246 cont./

304 3. The third and most curious is a manner of tattooing which I should like to designate as the antelope tattoo, a kind of inoculation that I have seen in no other native African tribe. This type of tattoo is used only by males and consists of the following: [827] Through parallel incisions little pieces of antelope flesh, especially gemsbok flesh, are placed under the skin of male children, with the idea that the child thus inoculated will have the speed of the antelopes in running. The incisions are most commonly made on the buttocks, but they are also to be found on the chest, abdomen, and back.

757 One also commonly finds scars all over the body from bloodletting incisions "to draw off" illnesses.

Viewed from above, the head shows no peculiarities, although 142 dolichocephaly does not seem to me to be as marked among the Bushmen as it is among the Bantu Negroes. The protuberance at the back of the head is so little developed that it can scarcely be felt on most individuals.

The profile view of the face permits one to recognize a clear alveolar prognathy. In the case of most individuals the upper lip in the profile view extends beyond the tip of the nose. The edge of hair around the fairly straight forehead runs in an even curve from one ear to the other.

The bones of the eyebrow arches protrude sharply, while the forehead bulge is only slightly developed.

The cheekbones with the widely-projecting zygomatic arches form prominences jutting out sharply in the temporal and cheek region.

Most Bushmen show a striking prominence of the parotid gland 142 region, which in the case of some individuals swells out so that it 147 is actually hemispherical. I was unable to determine whether the swelling is caused more by hypertrophy of the parotid gland or by a particularly strong development of the chewing musculature. This swelling of the parotid gland region is, I believe, not a racial peculiarity of the Bushmen, but rather a consequence of their way of life which necessitates a root diet requiring very heavy use of the chewing apparatus. At any rate, I observed the same peculiarity among the Herero, who for a long time were dependent upon veld food.

/246 cont./

142 The Herero, like the Bushmen, give the use of veld food,
147 especially the onion known as unki, as the cause of this peculiarity.
171 The attached photographs illustrate the swelling in the case of a Bushman (Fig. 3) and a Herero (Fig. 4).

The nose is sharply set off from the forehead and strikingly
142 small. The bridge of the nose is so flat that in some cases one can scarcely speak of a bridge of the nose; the area between the cheekbones is an almost level surface. The tip /247/ of the nose is small and pointed slightly upward. The largest diameter of the nostrils runs diagonally. The lips are narrow in comparison with those of most Negroes; their color is almost exactly that of the surrounding skin of the face.

The teeth of the majority of individuals are in pretty good condition; among the 39 persons I examined, I found only 28 carious teeth. In comparison with a European, the extreme wear of the teeth is striking; it progresses with age and is so marked in old people that the teeth are worn down to the roots, again a consequence of the way of life dependent upon a root diet. The incisors very slightly point forward.

The Heikum do not have artificial deformities of the teeth.
304 Several of those examined displayed the well-known Herero
648 deformity (filing down the inner sides of the two central upper incisors and removal of the four lower incisors) [Figs. 3 and 4 appear here], which is explained by the fact that these Bushmen had been Herero slaves in their childhood and were marked in the Herero manner by their former masters.

The ear is of normal size; its outline is rounded, not bent at an
142 angle. The ear lobe is always joined to the head.

In spite of general gauntness, the marked development of the abdomen in most cases is striking, even among the adults.

The female breast is conical in the case of individuals who have not borne children; the region around the nipple is usually separated by a gentle furrow from the rest of the breast. The color of the nipple area is deep brown. The nipple is raised.

[304] Circumcision is not practiced by either men or women. Among the Heikum and Kung women I did not find the abnormally pronounced development of the buttocks, known as steatopygia, which
[144] is so common among Hottentot women. To my mind this is

/247 cont./

144 conclusive evidence /248/ against any notion of racial kinship between the Bushmen and the Hottentot.

The arms are thin and not very muscular; the hands are small
142 and very delicate. In contrast to the musculature of the arms, that of the legs is better developed. The arch of the foot is good; only in one case did I observe flat feet.

The big toe is pointed straight and shows neither a deviation

[291]
[301]
[516]

Fig. 3.

Fig. 4.

toward the median line of the foot nor one away from it.

In most cases the second toe extends farthest, but in two cases it was exceeded by the first toe. The second and first or second and third toe of some of the others examined extended the same distance. The following table gives more exact information on this matter:

/248 cont./

142

	Number of persons examined	Second toe extending farthest	First toe extending farthest	First and second toe extending farthest	Second and third toe extending farthest
Men	14	9	1	4	0
Women	17	11	0	3	3
Children	8	7	1	0	0
Total	39	27	2	7	3

I was also able to gather some data concerning physiological
151 conditions. By means of Snellen charts, I discovered very keen sight for all the persons examined. Threefold visual keenness was attained by all those examined, and some had even higher degrees, up to sixfold.

The ticking of a watch could be heard at a distance of three meters by most of those examined.

I have frequently observed yawning among Bushmen.

The gait of the Bushmen has something very characteristic
48/ about it; in walking, they raise the knees surprisingly high, a custom that is explained by the nature of the country. Because of the low and commonly thorny shrubs through which they travel with uncovered legs, they are forced to raise their legs quite high in walking, and they maintain this gait even when they are moving across ground that has no growth on it. In addition, the achievements of these small inhabitants of the bush on the march and in running are quite enormous.

Bushmen who had been sent out on patrols by the station
[147] covered a distance of 130 kilometers in less than 48 hours without displaying visible signs of fatigue. They followed the cavalry troop, which frequently broke into a trot, happily and without difficulty oh foot, trotting themselves whenever the troop accelerated its pace.

/249/ Extreme astonishment is expressed by opening the mouth
201 and eyes wide. I was able to observe this myself when I played a phonograph before the unsuspecting Bushmen. When the performance was over, the audience asked me whether the people who were in the apparatus and sang there also slept in it and received their food through the horn.

/249 cont./

To indicate affirmation the head is thrown back and the
201 eyebrows are raised.

Otherwise, the physiognomic changes of expression are essentially like those of Europeans. Nevertheless, it cannot be denied that the Bushman's facial mobility is considerably greater than that of a European, and even quite weak emotions are expressed by lively gestures.

If I may be permitted, I should like to emphasize here a
194 peculiarity of voice among the Bushmen; among the women especially the voice seems to me abnormally high-pitched. In my opinion the speech of a Heikum woman is pitched several notes higher, on the average, than that of a Herero woman. Evidently this peculiarity is connected with the smallness of the larynx of the Heikum people.

The anthropometric figures presented above are doubtless much
141 smaller than comparable ones for the Herero, Nama, and
144 Bergdamara [Bergdama] living in the immediate vicinity of the Bushmen. Nonetheless, as regards smallness, the Heikum certainly do not approach the Pygmies of Central Africa. Whether further ethnological and ethnographic investigations will uncover kindred traits among these peoples remains to be shown by further research.
144 That the Bushmen represent an almost pure race is apparent from the fact that the skin color is the same for almost all individuals, and from the evident uniformity in the structure of the body, especially of the face. In addition, the other native tribes of Southwest Africa show a pronounced aversion to racial mixture with the despised Bushmen.

I come now to some ethnological and ethnographic observa-
535 tions which to me seem worthy of interest. I was especially
[171] interested in the dances of the Heikum, of which one, the //o //au, shows no similarity to any other native dance with which I have become acquainted in Southwest and East Africa.

The //o //au dance (in Kung language: //ooskê) is a men's dance in which a series of dueling runs by the performing dancers are represented (Figs. 5 and 6). Six men, three to a side in opposing pairs, kneel in an area about three meters square, with a free space between the two rows. In the middle of this free area there is a pile of veld food. The men kneel down, hunched very

/249 cont./

535 low, and at the same time sit on their heels. Two at a time fight out a "run," while the two other pairs are resting and watching. A run lasts for about two minutes; they change opponents in the runs in a certain order, so that each man gets to duel with each of the others.

/250/ A run goes as follows: in their hunched-over position the opponents look each other sharply in the eye as they bend far over as though looking for cover, and they do not take their eyes off each other even during the most violent movements of the arms. With the flat of their hands, the opponents now beat rhythmically and violently on the ground that has been loosened up in front of the players, a powerful blow being followed by a weaker one. At each blow the opponents utter a brief H'hm Hhe testifying to a high degree of physical and psychic tension. [Figs. 5 and 6 appear here.] The H'hm is the louder sound and is also accompanied by the stronger impact of the hands. At the same time motions of covering against the blow or thrust of the opponent are carried out. The face has an angry and at the same time wary expression, while the entire body is tensed to the utmost. After about two minutes have elapsed, one of the fighters makes a motion raising one arm and sinking down backwards, as though he had been struck or killed, while the opponent makes a gesture of triumph over the vanquished enemy.

/251/ The fighters are frequently covered with dirt, by the hands striking the loosened soil, but this does not disturb them in the tense observation of the opponent.

The point of the game is that supposedly one of the fighters has unjustly appropriated food which the other tries to take away from him in the duel. Even old men feeble with age play with great passion and exert all their strength. From time to time the women give water to the exhausted opponents to fortify them.

To be sure, the entire procedure reminds one of dogs or monkeys, furiously facing each other and growling, who are crouched to spring at each other and at the same time hop around in one spot on their front legs. Nonetheless, there is something attractive about it, in spite of the animal gestures and sounds, by virtue of its vivacity and of the emotions expressed by the faces.

533 Whereas the //o //au has no musical accompaniment, the
[535] other dances of the Heikum people are accompanied by a women's
Song.

/251 cont./

533 song. The melodies that I had an opportunity to observe were simple tone sequences which I vainly tried to arrange into a definite major or minor key such as is familiar to us. According to European concepts, the intervals are not pure. A common tonal sequence was the following, but in giving it I must

[535]

Fig. 5.

[535]

Fig. 6.

once more definitely stress that the intervals do not correspond precisely to those of our major key.

[539]

/251 cont./

533 Between the syllables hu and e a slight tremulo occurs, so that the entire song is reminiscent of yodeling. Instead of the sequence f-e-f-e-c, other tonal sequences were frequently sung, for instance, g-f-g-f-c or g-e-g-e-c. Even more complicated tonal sequences, reminiscent of our seventh chords, were not uncommon.

Singing is always accompanied by handclapping. The rhythm of the clapping is very curious; at any rate, it does not correspond to the feeling for musical rhythm that is familiar to Europeans. Two rhythms in particular have stayed in my memory, and I shall try to characterize them. The reader should think of a rhythm which, at least to my knowledge, does not exist in Aryan music, namely a 5/5 beat. Of the five fifths of this beat, they clap on the first, second, and fourth, while there are pauses on the third and fifth. The beat, in other words, would look as follows, if I designate the clapping sounds with ♩ and the pauses with 𝄽 :

Another clapping rhythm is the following, in which the three-quarter beat alternates with the two-quarter: /252/

535 Such a dance with musical accompaniment is the following, which I should like to designate as the pumpkin dance and which is reminiscent of a ball game frequently played by children in Germany. A number of women march at a rapid pace in goose step on a circular line, at the same time clapping rhythmically with their hands and singing. Among the Heikum the clapping is done [171] with the fingers spread apart, in contrast to the Herero, who clap with their fingers together. At the same time, a pumpkin [melon?] approximately the size of a child's head is thrown from one of the dancers to the other, and always backwards from the person in front to the person just behind her.

/252 cont./

535 The men standing around now attempt to catch the pumpkin as it flies through the air, and the women simulate great indignation when one of the men succeeds in doing so. This man then cuts up the pumpkin with a knife so that a new ball is required in order to continue the game.

Another dance, in which principally men participate, could be designated as the bird dance. The men dance in a circle, while the women stand around the circle, clap their hands, and [534] sing. The men wear dance bangles around their ankles, which are circlets of dried bean pods whose kernels rattle at every step and in this way strongly accentuate the dance rhythm. The steps of the dance are short, scarcely half a foot long, so that the progress of the dancers in the circle is quite slow. The vigor of the stepping or stamping on the ground alternates rhythmically. At the same time a number of symbolic gestures is performed. The most respected of the dancers has tied to his forehead a large eagle's beak decorated with glass and iron beads; he frequently makes a motion of hacking with the beak, and then, by slowly raising his arms, suggests the eagle's calm gliding in the air. Another dancer carries a bird's nest in his hand during the entire dance. At a certain stage, the dancers go through the motion of picking up fruit from the ground by bending down and making scooping motions in the air just above the ground. Shortly thereafter, some men dance towards the women and perform gestures as though they wanted to seize one of the women surrounding them.

535 Suddenly one of the dancers seems about to faint. A spectator
786 whom I questioned concerning the significance of this action told me that the Mukuru (Herero term for God) was in him. Other dancers, maintaining their dance step all the while, stand around the possessed person, try to help him, and cool him with fanning until he suddenly collapses with a piercing shriek. The bystanders catch him and carry him off to one side while the others go on dancing. The "doctor" now concerns himself with the unconscious [755] person; he blows twice in each ear and once on his forehead. Visibly, consciousness now returns and soon the one possessed is able to rise and dance again.

533 /253/ The musical accompaniment is supplied solely by the women; however, the dancing men are not entirely silent. Every

/253 cont./

533 once in a while, one of the dancers emits a loud yell, usually in a high falsetto, and sometimes a trill which likewise is pitched as high as possible, depending entirely on the individual's emotional state.

The clapping at a dance is audible over a great distance. One evening when I approached the station, I could hear the clapping of the dancing women at a distance of three kilometers.

The dances I have described seem to be widely distributed
535 among the Bushmen. At any rate, I found all three of them with
184 only slight variations among the Kung people residing in the Kaukau Veld.

Concerning the diet of the Heikum Bushmen I was able to dis-
262 cover the following. I should add my regret at this point that I lacked the necessary background for giving the botanical names of the veld crops.

The diet is predominantly vegetable; however, the Bushman is by no means a despiser of flesh. On the contrary, whenever he can have animal food, he will utilize it for his kitchen. In so doing, he is so unselective that one could say he eats everything he can lay his hands on. I have even seen Bushmen consume hyena flesh with great pleasure. The flesh is obtained partly by
224 hunting with bow and arrow, and partly with game traps. I shall discuss the hunting weapons later; here I only want to mention a game snare which I had the opportunity to observe in the Kaukau Veld. A snare twisted from plant bast had been placed on a game trail, drawn upwards by means of a flexible stalk stuck into the ground, and fastened to the ground by means of wooden hooks. When the game touches the snare, releasing it from the hooks, the flexible stalk pulls the snare up and shut. Game is also caught in traps. I was shown an iron hook fastened to a bamboo stick about five meters long, which was used to pull out game that had fallen into the pits.

The animals of the Bushman's hunting domain include all kinds of antelopes, from the giant eland to the tiny duiker, giraffes, hogs, hares, and, in the way of birds, predominantly guinea fowl.

The Bushman, however, finds objects to enrich his cuisine even among lower animals. In the realm of the amphibians he prefers

/253 cont./

224 the large bullfrog, whose bass voice resounds in all the puddles during the rainy season. The flesh of the frog is boiled with the
252 skin and bones, pounded to a paste in wooden vessels, and then eaten. Among the insects, grasshoppers and termites are used for
222 food. Both are roasted. In the brief time that they are winged, the termites are lured in such great numbers to a fire maintained for the purpose of catching them that it is an easy matter for the Bushman to collect a rich booty in a few hours. A special delicacy in the Bushman household is wild honey, which, as I was able to ascertain, is extremely tasty /254/ and is to be found in quantity on the Omuramba omatako as well as in the Kaukau Veld.

825 The bullfrog is called ntchei by the Bushmen (Herero: otjisume), the termite, /ui (Herero: othohumboli).

The vegetable diet naturally changes with the seasons and is
262 quite varied. I shall attempt to give a brief survey, though at
824 the same time I am aware that it can lay no claim to completeness.

1. The chamá or taba (Herero: omatanga). These are the roasted kernels of the Kaffir pumpkin [melon?], widely known here, which produce quite a tasty dish.

2. The //ǔni (Herero: omarunga); this is the Heikum Bushman name for the palm tree that is common in this region. The edible parts of the tree are the apple-sized fruit, whose skin has a sweetish taste reminiscent of St. John's bread, and the soft interior of the trunk. The latter is a whitish, soft, fibrous pulp, which the Bush-
[252] men prepare by cooking and pounding.

3. A species of white mushroom called naú by the Bushmen, majova by the Herero. The mushroom grows during the rainy season especially along the edges of termite hills; the diameter of its cap reaches about 20 centimeters. It is eaten raw as well as
[252] boiled. I do not know whether it is true that excessive eating of this mushroom has a detrimental effect on mental activity, as the Herero aver – ejova, plural majova, is the Herero word for stupid.

4. The unki, a well-known species of onion, about the size of a hazel nut, called //au by the Bushmen, is very common and forms an important part of the kitchen provisions, not only among the Bushmen, but also among the Herero.

[252] 5. The //guitcha of the Bushmen, ussessenga of the Herero,

/254 cont./

262 824 [252] is a tuberous fruit, eaten roasted, whose taste is reminiscent of potatoes.

6. A similar tuberous fruit is the ondubi of the Herero; the plant has rose-colored blossoms and long lanceolate leaves.

7. The árugu (Herero: omakungu), a type of cucumber. The plant is a climber whose fruits resemble our cucumbers; they reach the length of a finger and, when they ripen, become bright [252] red in color. They are roasted in ashes and eaten warm.

8. The //ániba (Herero: maramba), a small bush with a bean-like fruit, similar in appearance and taste to our broad beans.

9. The sng of the Kung Bushmen; this is a large climber with double-lobate leaves whose mighty root is greatly prized by the Bushmen as a water tuber. The fruit is the size of a walnut and consists of two cotyledons enclosed by a rind which in its fresh state is soft and becomes very hard when dry. Between the fruit and the rind there is a small quantity of a whitish, slimy fluid which keeps the interior of the rind /255/ lubricated. After re- [252] moval of the rind, the fruit is dried and roasted and then has the taste of the groundnut which is so common in East Africa. Its use has a distinctly laxative effect.

10. Like the Herero, the Bushmen are acquainted with other water tubers. The Herero word chue designates a smaller root with a very high water content, which has the shape and size of our beet.

11. The /a fruit of the Kung people is a nut slightly larger than the walnut, whose kernel, in a hard shell, tastes like our hazelnut. The hard inner shell is enclosed by a softer outer shell [252] which has a distinctively sweet taste and which the Bushmen boil to a sauce which in appearance and taste is distinctly reminiscent of applesauce.

291 There is not much to be said about the clothing of the Heikum. The men content themselves in most cases with a leather loincloth which is fastened in the back and front to a belt tied around the waist.

The women wear the same kind of leather cloth of slightly greater length around their loins and tie a second hide from one shoulder to the opposite hip.

/255 cont./

281 The hair is removed from the hides. After the skinning, the hides are stretched out on the ground for two days, exposed to the sun; then the hair is removed, and subsequently the juice of a red tuber is rubbed into the hides on the inside. After they have been prepared in this manner, they are buried in the ground for a longer period of time and are then ready for use.

Not infrequently the Bushmen wear sandals which they cut
291 from antelope hide in the simplest manner imaginable. A leather sole is fastened with three thongs to a leather ring lying over the instep and drawn tight below the ankle. One thong runs between the first and the second toe, while the two others run inside and outside the foot.

The children go about quite naked. Despite this sparseness
301 of clothing, the feeling for ornamentation finds full expression.

Many ornamental objects serve as amulets which are worn for a great variety of purposes. The women are more richly adorned than the men. Whereas the latter frequently content themselves with arm rings made of antelope leather, the women are usually overloaded with ornamental objects. One of the favorite women's ornaments is a necklace made of ostrich egg shells. The shells
[321] are worked into small, approximately penny-sized circular disks which are pierced in the middle and strung on a leather thong. Arm and leg rings are made of the same materials.

In place of the little ostrich egg disks, colored glass beads
[439] obtained in trade are frequently used for necklaces and arm rings. One sees many a woman walking along with a tortoise-shell box hanging on her chest, /256/ which is decorated with bead-studded leather strips and used as a container for tobacco.

Pierced pieces of root, distinguished by natural rings notched at regular intervals, are strung on leather thongs for necklaces.

224 I found the following ornamental objects which simultaneously
301 served the function of an amulet:

1. Little pieces of dried antelope flesh are worn on the chest in the belief that the wearer will not lack meat to eat so long as he wears these guarantees.

2. The same significance is attached to dried antelope ears which are worn in a small leather bag on the chest.

/256 cont./

224 3. A piece of root wood, called /un /gei, is pierced and
301 worn on a bast string on the chest. This little piece of root has
828 its distinctive story. When the Bushmen are hunting and want a clear eye to see game, they scrape a bit off its surface and rub the powdery scrapings between the eyes and from there upward across the middle of the forehead to the hairline. They believe that they can increase their keenness of vision by this procedure. An experiment that I made with the powder produced no change on the skin that was treated and naturally did not have any visible effect on my keenness of vision.

4. Little wooden sticks which are used as oracular instruments,
301 especially by the Kung people of the Kaukau Veld.
787 These are four wooden sticks which are strung on a string and worn on the chest. They are about as long as a finger and about two centimeters wide. Two of them are about as thick as a finger; the two others are only a few millimeters thick. One end of the sticks is cut off smooth, and the other pointed. These four sticks are questioned for all imaginable purposes. If the Bushman wants to know where game is, where he is to expect an enemy, or which route he is to take, he asks his sticks. He does so in the following manner. He spreads a piece of leather in front of him and crouches on the ground. Then he places all four sticks parallel and on top of one another in his left hand, the back of the hand being turned toward the ground. With a sudden jerk, accompanied by clicking the tongue, he throws the little sticks on the cloth; naturally, the sticks are scattered with their tips pointing in various directions. Depending on the matter at hand, each little stick signifies something special. When I had a Bushman captain in the Kaukau Veld consult his oracle concerning the fate of our patrol, one of the thick sticks in this throw signified the oxcart that accompanied the patrol. A lively argument concerning the significance of the sticks in a given case frequently arises between the consulter of the oracle and the spectator; finally, the view of the more respected of the two apparently wins out.

/257/ The clothing of the Kung people in the Kaukau Veld
184 is essentially the same as that of the Heikum on the Omuramba
291 ua omatako; even the ornaments do not show any great differences.
301 Nevertheless, I was struck by certain peculiarities of the Kaukau people that I did not find among the Heikum.

/257 cont./

301 people that I did not find among the Heikum. The Kung of the Kaukau Veld had rings braided from wildebeest tail hairs as arm and neck ornaments, and had made similar arm and leg rings from twisted grass. Furthermore they wore strings of twisted bast criss-crossed over the chest in considerable numbers. In addition, in the Kaukau Veld I found neck rings of dried and braided antelope tendons and, in larger numbers than among the Heikum, copper, [439] brass, and iron rings. The latter are obtained by the Kung Bushmen of the Kaukau Veld through trade with the Ovambo [Ambo] and Betschuana [Tswana] in exchange for ostrich eggs and antelope hides.

Like their clothing, the house furnishings of the Bushmen are 415 also very simple and quickly enumerated.

Wooden pans of various sizes, without handles, are generally found in every hut. For the pounding of food, the Bushmen use a cylindrical, mortar-like wooden vessel with thick walls and a [412] very strong bottom. A heavy staff about 30 centimeters long and four centimeters thick is used for pounding.

For chairs, they use wooden stools which by European standards 352 are absurdly small. They consist of two circular wooden disks scarcely the size of a hand and joined by two wooden rods. They stand about ten centimeters high.

There are plenty of axes in the villages. They consist of 412 small iron blades attached to thick wooden handles. The shape of the axe shows that the value of the iron necessitates frugal use of this valuable metal. The force of the blow, which in the case of European axes is produced by the weight of the iron part, is achieved by the Bushmen through a club-like enlargement of the wooden handle near the end of the axe. Side by side with axes that have a longitudinally-placed cutting edge, one also finds axes with a transverse cutting edge.

A common tool is the knife for removing hair from animal skins. This knife consists of a short, transverse iron blade imbedded in a wooden handle.

There are various kinds of tobacco pipes. The Bushmen, who 276 find a leaf tobacco in the bush throughout the year, are experts at making an improvised pipe bowl from a root tubercle in the shortest possible time. Large pipes made of the end of a kudu horn

/257 cont./

276 that has been cut off are very popular. The cut surface of the end of the horn is pressed to the mouth, and the smoke is sucked into the lungs in a deep draught. Very frequently simple cartridges are used as primitive, but nevertheless serviceable tobacco pipes.
[439] Clay pipes, which are not uncommon in the Kaukau Veld, are imported from the Betschuana.

415 /258/ A common kitchen utensil is a large, flat wooden spoon with a bent handle, which, however, is not used to place food in the mouth, but only to fill vessels. The Bushmen eat with
[264] their fingers; they drink their soups from the communal wooden bowl and polish up the rest with a crooked index finger and by licking it out with the tongue.

As pots they use pumpkin [mēlon?] vessels bound with leather
[482] thongs and carried over the shoulder on sticks.

As a special display object in many a hut one finds a large clay vessel with strong walls and decorated with white bands that
[439] have been notched into it. This vessel is imported from the Ovambo.

372 The tools for firemaking command special interest. The Bushman is acquainted with two, the dáni and the //oro.

The dáni (dǎ = fire) consists of two wooden sticks, each about 40 centimeters long. The rounded-off end of the one stick fits into a pan-like cavity at the end of the other stick. The edge of the pan is provided with a little opening through which the glowing wood that has been rubbed to tinder can be emptied onto a smooth stone during the fire-twirling. The Bushman can make fire with this tool in less than half a minute.

The other firemaking device known to the Bushmen is the
[439] //oro, a flint with striking ring and tinder box, imported from the Betschuana.

A tool that in addition to its use in leather working also serves
412 medical purposes is a pointed iron needle about 20 centimeters long and three millimeters thick, carried in a narrow leather sheath by almost every male Bushman. The needle is used with great skill
[752] for the removal of thorns from the skin, an operation which the Bushman naturally must frequently demand of his medicine man.

In addition to the above-mentioned hunting implements, the
482 game snare and game hook, I was shown a wooden staff, approximately one and a half meters long and worked with some skill, which is used for carrying game over the shoulder,

/258 cont./

000 which is used for carrying game over the shoulder.

411 Still to be mentioned are the weapons of the Bushmen. These are limited essentially to the bow and arrow. The bow consists of firm, flexible wood which tapers toward the ends.

[283] The bowstring is made by twisting together separated strands of gemsbok tendons.

The arrows have a very peculiar construction. The shaft is a piece of reed approximately 60 centimeters long, which is feathered at the lower end. A piece of eland bone, approximately 15 centimeters long, which has been sharpened to a point on both sides and carefully rounded by filing on stones, is inserted at the upper end of the shaft in such a manner that it can easily be taken out and reversed. The front end of the reed shaft, which is designed for the insertion of the bone arrowhead, /259/ is wrapped with bast in order to give it the necessary resistance. The two ends of the arrowhead are treated differently. The shorter and blunter tip is left free of poison and serves solely for hunting purposes. The
278 longer and more pointed end is covered with a brown, resin-like poisonous mass. It is very difficult to obtain any definite information from the Bushmen concerning the origin of this poison. They shyly evade questions about it.

I was able to ascertain only one fact, namely, that it is obtained by making incisions in the bark of a tree called chi (Herero: otjindombo). The arrowhead is dipped in the sap of the bark and
411 heated over the fire.

In addition to the bow and arrow, one also finds simple, unworked kirris, and -- at least among the Bushmen of the Kaukau Veld -- throwing spears with iron points that are obtained from the Ovambo in trade.

Arrow shafts and arrowheads are carried on the back in separate leather quivers.

They also use simple, feathered wooden arrows with pointed ends for fowl.

The dwellings are as simple as the whole way of life of the
342 Bushmen. The huts are only a little taller than a man and about three meters in diameter; they are set up by embedding sticks in the ground. These poles, which form the framework, are joined in the center, making a dome shape, and the interstices

/259 cont./

342 are filled with grass. The door is a hole scarcely a meter high;
[354] immediately behind it the fire burns almost continuously, so that, at least for the European, crawling into the hut presents considerable difficulties. Since the Bushmen are often forced to
[361] move their settlements because of the lack of veld food or because of the water conditions, they not infrequently content themselves with incomplete huts, which are not closed to form a full circle, but represent only a part, a segment of a hut, as it were, and give only scant protection against the sun.

For the rest, it is astonishing how hardened these practically
147 naked Bushmen are against the cold of the night which during the cold season is very sharp -- not infrequently below O° [centigrade]. Unclothed except for the loincloth, they calmly go to sleep on
[513] the cold ground near a small fire, exposed to the icy night air, a thought that gives chills to Europeans, who are unable to sleep without three woolen blankets on such nights.

Concerning the much discussed racial position of the Bush-
144 men, I have already remarked above -- at least concerning the Heikum and Kung -- that their descent from the Hottentots, as is frequently asserted, seems doubtful to me. The Bushmen's smaller size, of course, can be accounted for by the debilitation of the race through centuries-long unfavorable living conditions. What argues against the notion of racial affinity, however, is the anthropological fact that steatopygia is not to be found among the Heikum and Kung women, /260/ and, in addition, the lan-
197 guage is totally different.

I attempted to collect a sample of the vocabulary and some grammatical characteristics of the language of the Heikum on the Omatako and of the Kung in the Kaukau Veld, which I present below. In doing this, it became evident that the languages of the Heikum and Kung are merely dialectically differentiated, while they seem to have almost no relationship to the Nama language. The click sounds, to be sure, are almost the same as
[194] those in the Hottentot language; hence, / designates the dental click, // the lateral click, ! the cerebral [retroflex] click, and
[104] ≠ the palatal click. By ⁝ I designate the sharp opening of the glottis in speaking the initial vowel, which frequently occurs between a consonant and a vowel or between two vowels of the same word, and which does not occur in this fashion in the Nama.

B /260 cont./

191 In addition to the Bushman language, the Heikum of the
182 Omatako also speak Nama, whereas the Kung of the Kaukau
133 Veld speak only their Bushman language. The reason for this is readily seen if one realizes that the Kaukau Veld is an oasis enclosed on all sides by the large waterless stretches of the Kalahari, and hence is visited only during the rainy season by a few Betschuana hunters, but otherwise is completely isolated. Most of the Bushmen whom we encountered in the Kaukau Veld had never seen a white man prior to our arrival.

9. Personal Pronouns

mē or mēhí	me	dita	I
tschoē é	tschoē é	saatz	You

/266/

B
H
192

9. Personal Pronouns (cont.)

English	Heikum	Kung	Nama
He	ǎhng	ǎhng	//eib
We	tschússe	tschússe	sáta
You	ts¦ǎ	ts¦ǎ	sado
They	ǎhng(?)	tschudi tsch¦ǎ	//ēin

10. Possessive Pronouns

My	mēhng	mēhng	ti
Your	tschoë ē (?)	atschi (?)	sa
His	ǎhng(?)	ǎhing(?)	//ēib
Our	tsu /ǎ	wesse tschisch hug(?)	—
Your	mi dsú	mi tsú	—
Their	i /ǎ	(?)	—

The forms followed by (?) could not be ascertained with certainty.

11. Interrogatives

When?	ǂum katewa	—	ma /b ai
Where?	kole wǎ	—	mǎ pa
How?	kole wǎ	—	mǎ pa
Why?	disse wǎ	—	dein /ǎroma
What?	atchissi	atchissi	táre

12. Plural Formation

B
193

In Heikum, as in Kung, the plural is formed by affixing sen to the stem of the substantive; for example:

/ā eye, /oí hair,
/āsen eyes. /oísen hairs.

/266 cont./

13. Gender Differentiation

193 In order to differentiate gender, the Heikum and the Kung add to the substantive the syllable /ō for the masculine gender, and de or di for the feminine gender; for example:

eland antelope	/n
male	/n /ō
female	/n dē or /ndī

14. Conjugations

A. Present

In the present tense the form /ē di or a di intervenes between the personal pronoun and the verbal stem. tsía = to sleep.

English	Heikum	Kung
I sleep	mē /ē di tsǐǎ	mē /ē di tsǐǎ
You sleep	tschoë ē /ē di tsǐǎ	dschoë ē /ē di tsǐǎ
/267/		
He sleeps	ahng /ē di tsǐǎ or a di tsǐǎ	ahng /ē di tsǐǎ
We sleep	tschusse /ē di tsǐǎ	tschusse /ē di tsǐǎ
You sleep	tshǐǎ /ē di tsǐǎ	tschǐǎ /ē di tsǐǎ
They sleep	tschudi tschǐǎ tschu /ē di tsǐǎ	tschudi tschǐǎ tschu /e di tsǐǎ

B. Future

The future tense is formed by inserting the syllables /uma di between the personal pronoun and the verbal stem.

I shall sleep	mē /uma di tsǐǎ	me /uma di tsǐǎ
You will sleep	tschoë ē /uma di tsǐǎ	tschoë ē /uma di tsǐǎ etc.

C. Preterit

The Kung forms the preterit by inserting the syllables /eía di between the personal pronoun and the verbal stem; the Heikum

193 /267 cont./
insert the syllables na dō.

English	Heikum	Kung
I have slept	mē na do ts:ǂǎ	me /eia di ts:ǂǎ
You have slept	tschoē e na do ts a	tschoe e /eia di ts a

D. Imperative

The imperative is expressed by means of the verbal stem.

Sleep	ts:ǂǎ	ts:ǂǎ
Go	ū	ū

E. Infinitive

The infinitive is formed by attaching the prefix haga to the verbal stem.

To sleep	haga ts:ǂǎ	haga ts:ǂǎ
To go	haga u	haga u

15. Customary Phrases

192 What is your name	a /u	tschoe ē or a tschuē
What are you saying	atchissi a di koia	atchissi a di koia
Where is he?	ahng kolewa wa	—
Give me	na mē	na mē
What do you want	atchissi wa	atchiss 'a diū
Yes	ts:ing	—
No	koē	koē
Come here	oē	oē

/267 cont./

16. Numbers

802

English	Heikum	Kung	Name
1	tschin ≠ē	tschin ≠ē	/ai
2	tschi dzá	tschidzá	/gam
3	tschin /ǎni	tschin /ǎni	/oná
4	unsicher	unsicher	hagá
/268/			
5	/gau	/gau (/gau = hand)	—

6-9 quite uncertain among the Heikum and Kung

10	/gau ≠eissen (finger) (toes)	/gau ≠eissen	—

Among the Heikum and Kung one can discover with certainty only the terms for 1, 2, 3, 5, and 10; all the other expressions are uncertain. It is noteworthy that 5 is designated by "hand," and 10 by "hand and toes."

Among the Heikum and Kung Bushmen the manner of counting on the fingers is the same.

To indicate 1, the little finger of the left hand is grasped with the index finger and thumb of the right hand and bent in the hollow of the hand; for 2, 3, and 4, the fourth, third, and second fingers of the left hand follow, and are bent in the hollow of the hand in the same manner. For 6, 7, 8, and 9, the same procedure is used with the right hand as was used with the left for 1, 2, 3, and 4. In order to indicate 10, the two hands, flat but slightly hollowed, are placed against each other with the palms together.

The Bushman likes to touch his lower lip briefly with the
201 tip of the little finger of his right hand before he goes through the motions of counting on his fingers.

It has proved impossible to determine whether in the language
194 of the Heikum or the Kung the change of pitch in the pronunciation of vowels plays a part as it does in the language of the Hottentots.

[TITLE PAGE]

4: Werner FX10 Bushmen

I. Abhandlungen und Vorträge.

1. Anthropologische, ethnologische und ethnographische Beobachtungen über die Heikum- und Kungbuschleute.[1])

nebst einem Anhang über die Sprachen dieser Buschmannstämme.[2])

Von

H. Werner, Oberarzt in der Schutztruppe für Deutsch-Südwestafrika.

Übersendet vom K. Ober-Kommando der Schutztruppe.

Ein mehrere Monate währender Aufenthalt in der Nähe einer Buschmannwerft bei Otjomavare, einer am Omuramba ua omatako, etwa 50 *km* südlich von Grootfontein und 120 *km* nordöstlich von Waterberg gelegenen Wasserstelle, bot mir Gelegenheit zu einer Reihe von Beobachtungen an Buschleuten, die teils, wie ich glaube, Neues bringen, teils eine Ergänzung und Bestätigung von Bekanntem darstellen. Zunächst reizte es mich, durch Gewinnung absoluter Masse ein Urteil über die Grössenverhältnisse der als abnorm klein bekannten Buschleute zu erhalten, dann führte mich die nähere Bekanntschaft mit dem interessanten Völkchen zu weiteren Beobachtungen, die für den Ethnologen und den Ethnographen Interesse beanspruchen.

Die zu den anthropologischen Messungen erforderlichen Instrumente musste ich zum Teil mir selbst herstellen, doch hoffe ich, dass dieser Mangel der Genauigkeit der Ergebnisse keinen Eintrag getan hat.

Die Buschleute, um die es sich handelt, nennen sich „Heikum"leute, wobei das k durch den in der Namasprache mit || bezeichneten Schnalzlaut zu ersetzen ist. Gemessen wurden 31 Erwachsene und 8 Kinder.

Von den Erwachsenen sind 14 Männer und 17 Frauen.

Ich lasse zunächst die Durchschnittswerte der absoluten Masse folgen, dann einige Proportionszahlen und Indices. Tabellen, auf denen die ge-

1) Vorgelegt in der Sitzung vom 18. November 1905.

2) Die linguistischen Aufzeichnungen über die Sprache der Heikumbuschleute wurden in einer Heikumwerft bei Otjomavara am Omuramba Omatako gesammelt, während die sprachlichen Notizen über die Kungbuschleute in einer Kungwerft am Nordrande des Kaukaufeldes etwa 15 *km* westlich von Dobe aufgezeichnet wurden.

[p. 241]

4: Werner FX10 Bushmen

samten Masse jedes einzelnen Gemessenen verzeichnet sind, liegen bei, desgleichen Beobachtungsblätter für die auf die deskriptiven Merkmale der Gemessenen bezüglichen Beobachtungen.

Die Durchschnittswerte der gemessenen Erwachsenen sind folgende:

	Männer	Frauen
1. Körpergrösse	155,3	149,7
2. Höhe des Kinnrandes über dem Boden	135,7	130,6
3. „ „ Nabels über dem Boden	93,2	90,4
4. „ „ oberen Randes der Symphyse über dem Boden	82,2	79,6

Der Ernährungszustand der Untersuchten ist im allgemeinen dürftig zu nennen, der Fettvorrat gering; die Haut ist auch bei jüngeren Individuen auffallend schlaff und lässt sich in weiten Falten abheben. Man hat den Eindruck, dass zwischen dieser Schlaffheit der Haut und dem extremen Schwanken der Flüssigkeitsdurchtränkung der Gewebe, wie es bei dem häufigen lange anhaltenden Dursten, dem die Buschleute ausgesetzt sind, die Regel ist, ein Zusammenhang besteht. Die Männer versicherten mir, sie könnten vier Tage lang bei grosser Hitze ohne Wasser marschieren, eine Angabe, der man wohl Glauben schenken darf.

Die Hautfarbe ist bei allen Untersuchten mit Ausnahme von zweien, bei denen eine Rassenmischung nicht ausgeschlossen ist, ein Braun von mittlerer Tontiefe ins Gelbe spielend.

Die Handteller und Fusssohlen sind heller gefärbt, bilden jedoch gegen den Handrücken keinen so auffallenden Kontrast wie beim Bantu-

4: Werner FX10 Bushmen

neger. Die Haut der Brust und des Bauches ist um eine Nuance dunkler gefärbt als die des Gesichts. Narben sind namentlich auf Brust und Bauch sehr häufig und rühren gewöhnlich von Brandwunden her, denen sich die Buschleute durch Sitzen und Einschlafen am offenen Feuer leicht aussetzen. Diese Narben sind heller tingiert als die Umgebung und sehen fast rein gelb aus.

Die Iris ist bei allen Untersuchten tief braun gefärbt.

Der Haarwuchs ist, verglichen mit dem des Europäers, sehr bescheiden; er ist fast ganz auf den Schädel beschränkt, Barthaar findet man nur bei einzelnen Männern und auch bei diesen nur sehr spärlich. Körper-, Achsel- und Schamhaar ist fast gar nicht vorhanden.

Die Farbe des Haupthaares ist tiefschwarz. Das einzelne Haar wird bei den Männern etwa 4, bei den Frauen gegen 6 *cm* lang; es ist fein und spiralig gerollt; der Krümmungsradius der Spirale beträgt etwa 2 *mm*. Je 2—3 Haare stehen in Gruppen dicht beisammen. Eine Anzahl solcher Gruppen vereinigt sich zu einem Büschel, der ein fast unentwirrbares Haargeflecht darstellt. Zwischen den Büscheln ist die braungelbe Kopfhaut sichtbar, so dass die Schädeloberfläche den Eindruck einer schwarz gefleckten Fläche macht. In der Haartracht zeigen sich weitgehende Verschiedenheiten, doch wird von allen Buschleuten das Kopfhaar von Zeit zu Zeit geschnitten; dabei lassen die Frauen häufig einen Kranz längerer Haare, der von der Stirnhaargrenze horizontal nach hinten verläuft, stehen. Häufig auch findet man eine ovale Stelle auf dem Scheitel oder den Stirnrand des Kopfhaares bis zu den Ohren hin ausrasiert.

Ausfall des Kopfhaares habe ich auch bei alten Personen nicht beobachtet, wohl aber Grauwerden, doch auch dieses nicht in so hohem Grade wie bei Europäern.

Die Tätowierung ist bei den Heikumbuschleuten sehr beliebt.

Ich habe drei Arten von Tätowierung vorgefunden:

1. Eine Schmucktätowierung. Dieselbe besteht in parallelgestellten Längsschnitten von etwa 1 *cm* Länge, die in Reihen angeordnet sind. Diese Schnittreihen finden sich namentlich im Gesicht auf Wangen, Schläfen und Stirn und verlaufen besonders bei Frauen häufig strahlenförmig auf die Gesichtsmitte zu, wobei jedoch die Gesichtsmitte selbst freigelassen wird. Sie findet sich aber auch auf der Haut des übrigen Körpers an beliebigen Stellen, auf Brust, Bauch, Oberarm und Oberschenkel. Die Schnitte sind ganz oberflächlich und erscheinen als feine schwarze Linien; die schwarzblaue Färbung der Narben wird durch Einreiben von Holzkohle in die frischen Schnitte erreicht.

2. Tiefere und dementsprechend stärkere Narben hinterlassende Schnitte bilden die Stirntätowierung, die allen Heikumbuschleuten ohne Unterschied des Alters und Geschlechts gemeinsam ist. Die Tätowierung besteht in mehreren senkrecht stehenden parallelen Schnitten von etwa 2 *cm* Länge zwischen den Augenbrauen. Durch diese Tätowierung entsteht eine Anzahl, gewöhnlich fünf, tiefer, nahe beieinander stehender Falten zwischen den Augenbrauen, die dem Gesicht auch jüngerer Individuen ein älteres Aussehen geben. Bei älteren Personen ist der Narben-

4: Werner FX10 Bushmen

grund durch Keloidbildung erhaben, so dass die Gegend zwischen den Augenbrauen ein hahnenkammähnliches Aussehen gewinnt.

3. Die dritte und merkwürdigste ist eine Tätowierungsart, die ich als Antilopentätowierung bezeichnen möchte, eine Impfungsform, wie ich sie noch bei keinem der afrikanischen Eingeborenenstämme gesehen habe. Sie findet sich nur bei männlichen Individuen und besteht in folgendem: Durch Parallelschnitte werden den männlichen Kindern kleine Stückchen Antilopenfleisch, besonders Gemsbockfleisch, unter die Haut gebracht in der Idee, dass auf diese Weise das so geimpfte Kind die Schnelligkeit der Antilopen im Laufen erhalte. Die Impfschnitte werden mit Vorliebe auf den Hinterbacken angebracht, finden sich jedoch auch auf Brust, Bauch und Rücken.

Häufig findet man an den verschiedensten Körperstellen auch Narben, welche von Schröpfschnitten zur „Ableitung" bei Krankheiten herrühren.

Der Kopf bietet in seiner Ansicht von oben keine Besonderheiten, doch scheint mir die Dolichocephalie bei den Buschleuten nicht so ausgesprochen zu sein wie bei den Bantunegern. Die Hinterhauptsprotuberanz ist sehr gering entwickelt, so dass sie bei den meisten Individuen kaum zu fühlen ist.

Die Profilansicht des Gesichtes lässt eine deutliche alveoläre Prognathie erkennen; bei den meisten Individuen überragt die Oberlippe in der Profilansicht die Nasenspitze. Die Haarumrandung der ziemlich steilen Stirn verläuft in gleichmässiger Biegung von einem Ohr zum andern.

Die knöchernen Augenbrauenbogen springen stark vor, während der Stirnglatzenwulst gering entwickelt ist.

Die Wangenbeine bilden mit den weit ausladenden Jochbögen stark über die Schläfen- und Wangengegend hervorragende Erhebungen.

Auffallend ist bei den meisten Buschleuten das deutliche Vorspringen der Ohrspeicheldrüsengegend, die sich bei manchen Individuen geradezu halbkugelartig vorwölbt. Ob diese Vorwölbung mehr durch eine Hypertrophie der Ohrspeicheldrüse oder durch besonders starke Entwicklung der Kaumuskulatur bedingt ist, vermochte ich nicht festzustellen. Diese Vorwölbung der Ohrspeicheldrüsengegend ist, wie ich glaube, nicht eine Rasseneigentümlichkeit der Buschleute, sondern eine Folge der Wurzelnahrung benötigenden Lebensweise, die eine sehr starke Inanspruchnahme des Kauapparates erfordert; wenigstens habe ich dieselbe Eigentümlichkeit auch bei Hereros beobachten können, die lange Zeit auf Feldkost angewiesen waren.

Hereros wie Buschleute bezeichnen als Ursache dieser Eigentümlichkeit den Genuss von Feldkost, insbesondere der als Unki bekannten Zwiebelart. Die beigefügten Photographien bringen die Vorwölbung bei einem Buschmann (Fig. 3) und bei einem Herero (Fig. 4) zur Darstellung.

Die Nase ist gegen die Stirn stark abgesetzt und von auffallender Kleinheit. Der Nasenrücken ist sehr flach, so dass man bisweilen von einem Nasenrücken kaum sprechen kann und eine fast ebene Fläche die Verbindung von einem Wangenbein zum andern herstellt. Die Nasen-

4: Werner FX10 Bushmen

spitze ist klein und etwas aufwärts gerichtet. Die Nasenlöcher sind mit ihrem grössten Durchmesser quergestellt.

Die Lippen sind, verglichen mit denen der meisten Neger, schmal; ihre Farbe gleicht fast genau der der umgebenden Gesichtshaut.

Die Zähne sind bei der Mehrzahl der Individuen in recht gutem Erhaltungszustand; kariös fand ich bei den sämtlichen 39 Untersuchten nur 28 Zähne. Auffallend ist bei einem Vergleich mit einem Europäergebiss die hochgradige, mit dem Alter zunehmende Abnutzung, die bei alten Individuen so stark ist, dass die Zähne bis auf die Wurzel abgekaut sind, auch eine Folge der auf Wurzelnahrung angewiesenen Lebensweise. Die Schneidezähne sind nur in ganz geringem Grade nach vorn gerichtet.

Künstliche Deformitäten der Zähne haben die Heikum nicht; wenn mehrere der Untersuchten die bekannte Hererodeformität (Abschleifen der Innenseiten der beiden mittleren oberen und Entfernen der vier

Fig. 3.

Fig. 4.

unteren Schneidezähne) zeigten, so erklärt sich dies daraus, dass diese Buschleute in ihrer Kindheit Hererosklaven gewesen und von ihren damaligen Herren nach Hererosart gekennzeichnet worden sind.

Das Ohr ist von normaler Grösse, die Umfangslinie ist gerundet, nicht winklig geknickt. Das Ohrläppchen ist stets angewachsen.

Am Rumpf fällt auch bei den Erwachsenen die meist starke Entwicklung des Bauches trotz sonstiger Magerkeit auf.

Die Frauenbrust ist bei Individuen, die nicht geboren haben, kegelförmig; die Gegend des Warzenhofes ist gewöhnlich durch eine seichte Furche von der übrigen Brust geschieden. Die Farbe des Warzenhofes ist tiefbraun. Die Brustwarze ist erhaben.

Beschneidung ist weder bei Männern noch Weibern üblich. Die als Steatopygie bezeichnete, bei den Hottentottenweibern so häufige abnorm starke Gesässentwicklung habe ich bei den Weibern der Heikum und Kung nicht gefunden, ein Umstand, der mir mit grosser Entschiedenheit

gegen die Rassenverwandtschaft der Buschleute mit den Hottentotten zu sprechen scheint.

Die Arme sind dünn und wenig muskelkräftig, die Hände klein und sehr zart. Im Gegensatz zur Armmuskulatur ist die der Beine besser entwickelt. Die Fusswölbung ist gut; Plattfuss habe ich nur in einem Falle gesehen.

Die grosse Zehe ist geradeaus gerichtet und weist weder eine Abweichung auf nach der Fussmittellinie zu, noch eine solche von dieser hinweg.

In den meisten Fällen ragt die zweite Zehe am weitesten hervor, doch wurde sie in zwei Fällen von der ersten überragt. Bei einigen andern Untersuchten waren zweite und erste oder zweite und dritte Zehe gleich weit hervorragend. Genaueren Aufschluss über diese Verhältnisse gibt die folgende Tabelle:

	Zahl der Untersuchten	Zweite Zehe am weitesten hervorragend	Erste Zehe am weitesten hervorragend	Erste und zweite Zehe am weitesten hervorragend	Zweite und dritte Zehe am weitesten hervorragend
Männer	14	9	1	4	0
Frauen	17	11	0	3	3
Kinder	8	7	1	0	0
Summe . .	39	27	2	7	3

Auch über physiologische Verhältnisse konnte ich einige Beobachtungen sammeln.

Bei allen Untersuchten fand ich vermittels Snellenscher Tafeln eine sehr grosse Sehschärfe. Dreifache Sehschärfe wurde von allen Untersuchten erreicht, bei einzelnen noch höhere Grade bis zu sechsfacher Sehschärfe.

Von den meisten Untersuchten wurde das Ticken einer Uhr in 3 *m* Entfernung vernommen.

Gähnen habe ich bei Buschleuten häufig beobachtet.

Der Gang der Buschleute hat etwas sehr charakteristisches; es werden nämlich dabei die Knie auffallend stark gehoben, eine Gewohnheit, die sich aus der Eigentümlichkeit des Geländes erklärt, in dem die Buschleute leben; sie sind durch das niedrige häufig dornige Buschwerk, durch welches sie sich mit unbekleideten Beinen fortbewegen, gezwungen, beim Gang die Beine stark zu heben und behalten diesen Gang auch bei, wenn sie über nicht bewachsenen Boden sich fortbewegen. Im übrigen sind die Marsch- und Laufleistungen dieser kleinen Buschbewohner ganz enorm.

Zu Patrouillengängen von der Station ausgesandte Buschleute legten innerhalb weniger als 48 Stunden eine Strecke von 130 *km* zurück, ohne sichtbare Zeichen von Ermüdung zu zeigen. Der oft trabenden Truppe folgten sie ohne Schwierigkeit und froher Laune zu Fuss, indem sie bei schnellerer Gangart sich ebenfalls in Trab setzten.

4: Werner FX10 Bushmen

Höchstes Erstaunen wird durch weites Öffnen des Mundes und der Augen kundgegeben. Ich konnte mich davon überzeugen, als ich vor den ahnungslosen Buschleuten ein Grammophon spielen liess; als die Vorführung zu Ende war, fragten mich die Zuhörer, ob denn die Leute, die in dem Apparat wären und sängen, auch darin schliefen und durch den Schalltrichter ihre Kost erhielten.

Zum Zeichen der Bejahung wird der Kopf unter gleichzeitigem Hochziehen der Augenbrauen zurückgeworfen.

Im übrigen stimmen die physiognomischen Ausdrucksveränderungen im wesentlichen mit denen der Europäer überein, doch lässt sich nicht verkennen, dass die Gesichtsbeweglichkeit des Buschmanns eine weit grössere ist als die des Europäers und dass schon ganz geringe Affekte lebhafte Gesten auslösen.

Es sei mir hier gestattet, eine Eigenart der Stimme der Buschleute hervorzuheben; dieselbe erscheint mir besonders bei den Frauen abnorm hoch zu sein; die Sprache eines Heikumweibes liegt nach meinem Dafürhalten um mehrere Töne im Durchschnitt höher als die eines Hereroweibes. Augenscheinlich hängt diese Eigentümlichkeit mit der Kleinheit des Kehlkopfes der Heikumleute zusammen.

Die eingangs gegebenen anthropometrischen Zahlen sind zweifellos weit geringer als die der in unmittelbarer Nachbarschaft der Buschleute wohnenden Hereros, Namas und Bergdamaras, doch reichen die Heikums, was Kleinheit anlangt, sicher nicht heran an die Zwergvölker Innerafrikas. Ob ein weiteres Studium ethnologischer und ethnographischer Verhältnisse diesen Völkern verwandte Züge aufdecken wird, muss weitere Forschung lehren. Dass es sich bei den Buschleuten um eine fast reine Rasse handelt, geht hervor aus der fast allen Individuen gleichen Hautfarbe und der sichtlichen Übereinstimmung in der Körper- und besonders in der Gesichtsbildung; zudem besteht bei den übrigen Eingeborenenstämmen Südwestafrikas eine ausgesprochene Abneigung gegen eine Rassenvermischung mit den verachteten Buschleuten.

Ich komme nun zu einigen ethnologischen und ethnographischen Beobachtungen, die mir Interesse zu verdienen scheinen. Besonders angezogen haben mich die Tänze der Heikumleute, von denen einer, der ||o ||au, keinerlei Ähnlichkeit aufweist mit irgend einem mir sonst bekannt gewordenen Eingeborenentanz Südwest- und Ostafrikas.

Der ||o ||au-Tanz (Kungsprache: ||ooské) ist ein Männertanz, durch welchen eine Reihe von Duellgängen der beteiligten Tänzer zur Darstellung gebracht wird (Fig. 5 und 6). Sechs Männer, je drei einander gegenüber, knien auf einem Raum von etwa 3 *m* im Geviert, so dass der zwischen den beiden Reihen befindliche Raum frei bleibt. In der Mitte dieses freien Raumes liegt ein Haufen Feldkost. Die Männer knien tief niedergekauert und sitzen dabei auf den Fersen. Je zwei fechten einen „Gang" aus, während die beiden anderen Paare sich ausruhen und zuschauen. Ein Gang dauert etwa 2 Minuten; es wird in den Gängen zwischen den Kämpfenden in bestimmter Reihenfolge gewechselt, so dass jeder mit jedem zum Duell kommt.

Ein Gang besteht in folgendem: die Gegner sehen sich in ihrer zusammengekauerten Stellung weit vornübergebeugt wie Deckung suchend scharf in die Augen und wenden auch bei den heftigsten Bewegungen der Arme keinen Blick von einander; die Hände der Gegner schlagen nun im Takt, indem auf einen kräftigeren Schlag ein schwächerer folgt, mit kräftigem Ruck flach auf den vor den Spielenden aufgelockerten Boden, wobei die Kämpfenden bei jedem Aufschlag ein von hoher körperlicher

Fig. 5.

Fig. 6.

und seelischer Anspannung zeugendes kurz vorgestossenes H'hm Hhe ertönen lassen; der stärkere Ton liegt dabei auf dem H'hm, das auch von dem stärkeren Aufschlag der Hände begleitet wird. Dabei werden die Bewegungen des Deckens gegen vom Gegner geführten Schlag oder Stoss ausgeführt. Das Gesicht hat einen zornigen und dabei lauernden Ausdruck, während der ganze Körper aufs höchste gespannt ist. Nach Verlauf von etwa 2 Minuten macht einer der Kämpfer eine Bewegung des Getroffen- oder Erschlagenseins, indem er einen Arm erhebt und nach hinten übersinkt, während der Gegner eine Geste des Triumphes über den besiegten Gegner macht.

4: Werner FX10 Bushmen

Durch das Aufschlagen der Hände auf den aufgelockerten Boden werden die Kämpfenden häufig mit Sand überschüttet, was sie aber nicht in der gespannten Beobachtung des Gegners stört.

Der Sinn des Spieles ist angeblich der, dass einer der Kämpfenden sich unrechtmässig Kost angeeignet hat, die ihm der andere im Kampf abzunehmen trachtet. Selbst alterasschwache Greise spielen mit grosser Passion und äusserster Anspannung der Muskelkraft mit. Die Frauen reichen von Zeit zu Zeit den ermatteten Gegnern Wasser zur Stärkung.

Der ganze Vorgang erinnert zwar an sich wütend gegenüberstehende und anknurrende Hunde oder Affen, die sich zum Ansprung zusammenkauern und dabei auf den Vorderbeinen kleine Sätze auf der Stelle machen, doch hat er trotz der tierischen Gesten und Laute etwas durch seine Lebhaftigkeit und durch den Affekt, der aus den Gesichtszügen spricht, Anziehendes.

Während der ||o ||au keine musikalische Begleitung hat, werden die anderen Tänze der Heikumleute von einem Frauengesang begleitet. Die Melodien, die ich zu beobachten Gelegenheit hatte, waren einfache Tonfolgen, die ich vergeblich in eine bestimmte uns geläufige Dur- oder Molltonart einzureihen versuchte; die Intervalle sind nach europäischen Begriffen nicht rein. Eine häufige Tonfolge war die folgende, wobei ich jedoch nochmals ausdrücklich betone, dass die Intervalle nicht genau denen unseres Durakkordes entsprechen.

Zwischen den Silben hu und e findet ein leichtes Überschlagen der Stimme statt, so dass der ganze Gesang an ein Jodeln erinnert. Statt der Folge f e f e c wurden häufig andere Tonfolgen gesungen: so g f g f e oder g e g e c. Auch kompliziertere Tonfolgen, die an unsern Septimenakkord erinnern, waren nicht selten.

Der Gesang wird stets von Händeklatschen begleitet. Dabei ist der Rhythmus, in dem geklatscht wird, sehr eigenartig; jedenfalls entspricht er nicht dem uns Europäern geläufigen Gefühl für musikalischen Takt. Mir sind besonders zwei Rhythmen im Gedächtnis geblieben, die ich zu charakterisieren versuchen will. Man denke sich einen Takt, der in der arischen Musik allerdings meines Wissens nicht existiert, nämlich einen $^5/_4$-Takt. Von den fünf Fünfteln dieses Taktes wird auf das erste, zweite und vierte Fünftel geklatscht, während auf das dritte und fünfte Fünftel Pausen fallen. Der Takt würde also, wenn ich die Klatschgeräusche mit ♩, die Pausen mit 𝄽 bezeichne, so aussehen:

Ein anderer Klatschrhythmus ist der folgende, bei dem $^5/_4$- mit $^3/_4$-Takt wechseln:

Ein solcher Tanz mit musikalischer Begleitung ist der folgende, den ich als Kürbistanz bezeichnen möchte und der an ein in Deutschland von Kindern viel gespieltes Ballspiel erinnert. Eine Anzahl von Frauen geht in flottem Schritt im Gänsemarsch auf einer Kreislinie, dabei im Takt mit den Händen klatschend und singend. Das Klatschen geschieht bei den Heikums mit gespreizten Fingern im Gegensatz zu den Hereros, die mit aneinander gelegten Fingern klatschen. Dabei wird ein Kürbis von etwa Kinderkopfgrösse von einer der Tänzerin zur andern geworfen und zwar stets rückwärts vom Vordermann zum nächstfolgenden Hintermann.

Die umstehenden Männer bemühen sich nun, den Kürbis in der Luft abzufangen, und die scheinbare Entrüstung der tanzenden Frauen ist gross, wenn dies einem der Männer gelingt, der dann den Kürbis mit einem Messer zerschneidet, so dass ein neuer Ball zur Fortsetzung des Spieles genommen werden muss.

Ein anderer Tanz, an dem vornehmlich die Männer beteiligt sind, könnte mit dem Namen Vogeltanz bezeichnet werden. Die Männer tanzen im Kreise, die Frauen umstehen den Kreis, klatschen in die Hände und singen. Die Männer haben um die Knöchelgegend Tanzspangen gelegt; es sind dies Ketten von trockenen Bohnenschoten, deren Fruchtkerne bei jedem Schritt klappern und so den Tanzrhythmus scharf hervorheben. Die Tanzschritte sind kurz, kaum $^1/_2$ Fuss lang, so dass die Fortbewegung der Tanzenden im Kreise nur langsam vor sich geht. Die Stärke des Auftretens bezw. Aufstampfens auf den Boden wechselt im Rhythmus. Dabei wird eine Reihe symbolischer Gesten gemacht. Der angesehenste der Tänzer hat sich einen mit Glas- und Eisenperlen verzierten grossen Adlerschnabel vor die Stirn gebunden und macht häufig die Bewegung des Hackens mit dem Schnabel, dann wieder, indem er langsam die Arme erhebt, die Geste des ruhigen Schwebens des Adlers in der Luft. Ein anderer Tänzer trägt während des ganzen Tanzes ein Vogelnest in der Hand. In einer bestimmten Phase des Tanzes machen die Tänzer die Bewegung des Fruchtaufnehmens vom Boden, indem sie sich niederbücken und dicht über dem Boden in die Luft greifen; bald darauf tanzen einzelne auf die Frauen zu und machen die Bewegungen, als wollten sie eine der Umstehenden ergreifen.

Plötzlich wird einer der Tänzer scheinbar bewusstlos; ein Zuschauer, den ich nach der Bedeutung dieses Vorgangs fragte, sagte mir, der Mukuru (Hererobezeichnung für Gott) sei in ihm. Andere Tänzer umstehen, immer im Tanzschritt bleibend, den Besessenen, bemühen sich um ihn und fächeln ihm Kühlung zu, bis dieser plötzlich mit einem gellenden Schrei umsinkt. Die Umstehenden fangen ihn auf und tragen ihn bei Seite, während die andern weitertanzen. Der „Arzt“ nimmt sich jetzt des Bewusstlosen an; er pustet je zweimal in jedes Ohr und einmal auf die Stirn. Sichtlich kehrt jetzt das Bewusstsein wieder und bald ist der Besessene imstande, sich zu erheben und weiterzutanzen.

4: Werner FX10 Bushmen

Die musikalische Begleitung wird allein von den Frauen geliefert, doch verhalten sich auch die tanzenden Männer nicht ganz schweigsam; bisweilen stösst einer der Tänzer einen lauten Schrei, gewöhnlich in hoher Fistellage, aus, bisweilen einen ebenfalls in möglichst hoher Tonlage schwebenden Zungentriller, ganz wie es der Affekt dem Einzelnen eingibt.

Das Klatschen bei einem Tanz ist sehr weit hörbar; als ich mich eines Abends der Station näherte, hörte ich bereits auf 3 *km* Entfernung das Klatschen tanzender Frauen.

Die geschilderten Tänze scheinen unter den Buschleuten weite Verbreitung zu haben, wenigstens fand ich alle drei bei den im Kaukaufeld wohnenden Kungleuten mit nur geringen Abweichungen wieder.

Über die Ernährung der Heikumbuschleute konnte ich das Folgende in Erfahrung bringen, wobei ich bedauere, dass mir die nötigen Grundlagen zur botanischen Bestimmung der Feldkost fehlten.

Die Nahrung ist eine vorwiegend vegetabilische, doch ist der Buschmann durchaus kein Fleischverächter; im Gegenteil, wo er animalische Nahrung haben kann, nützt er sie für seine Küche aus. Er ist dabei so wenig wählerisch, dass man sagen kann, er isst alles Fleisch, dessen er habhaft werden kann; selbst Hyänenfleisch habe ich Buschleute mit grossem Behagen verzehren sehen. Das Fleisch wird beschafft teils durch Jagd mit Bogen und Pfeil, teils durch Wildfallen. Auf die Jagdwaffen werde ich später zu sprechen kommen, hier möchte ich nur eine Wildschlinge erwähnen, die ich im Kaukaufelde zu sehen Gelegenheit hatte. Auf einen Wildpfad war eine aus Pflanzenbast gedrehte Schlinge gelegt, welche durch einen in den Boden gesteckten federnden Stamm nach oben gezogen und am Boden durch Holzhaken festgehalten wurde. Wenn das Wild beim Berühren der Schlinge diese von den Haken abstreift, zieht der federnde Stamm die Schlinge nach oben zu. Auch in Gruben wird das Wild gefangen; mir wurde ein an einem etwa 5 *m* langen Bambusstabe befestigter Eisenhaken gezeigt, der dazu dient, das in die Gruben gefallene Wild herauszuziehen.

Die Tiere, die für den Buschmann in Betracht kommen, sind alle Arten von Antilopen, von dem riesigen Elan bis zum kleinen Deuker, Giraffen, Schweine, Hasen, von Geflügel namentlich Perlhühner.

Doch noch tiefer in der Tierreihe findet der Buschmann Objekte zur Bereicherung seiner Küche. Aus der Reihe der Amphibien bevorzugt er den grossen Ochsenfrosch, der zur Regenzeit in allen Tümpeln seinen Bass ertönen lässt. Das Fleisch des Frosches wird mit der Haut und den Knochen gekocht, in hölzernen Gefässen zu einem Brei gestampft und dann gegessen. Von Insekten werden die Heuschrecken und Termiten zu Speisen verwandt. Beide werden geröstet gegessen. Die Termiten werden in der kurzen Zeit, in der sie geflügelt sind, durch zum Zwecke ihres Fanges unterhaltene Feuer in so grossen Mengen angelockt, dass es den Buschleuten ein Leichtes ist, in wenigen Stunden eine reiche Beute zu sammeln. Eine besondere Delikatesse im Buschmannshaushalt ist der wilde Honig, der, wie ich mich selbst überzeugen konnte, sehr schmack-

haft ist, und am Omuramba omatako sowohl wie im Kaukaufelde viel gefunden wird.

Den Ochsenfrosch nennt der Heikumbuschmann ntchei (Herero: otjisume), die Termite |ui (Herero: othohumboli).

Die vegetabilische Nahrung wechselt natürlich nach den Jahreszeiten und ist sehr mannigfach. Ich will versuchen, eine kurze Übersicht zu geben, wobei ich mir klar bin, dass dieselbe keinen Anspruch auf Vollständigkeit machen kann.

1. Die Chamá oder taba (Herero: omatanga). Es sind dies die gerösteten Kerne des hier allgemein bekannten Kaffernkürbis, die ein ganz wohlschmeckendes Gericht liefern.

2. Die ||üni (Herero: omarunga); mit diesem Namen bezeichnet der Heikumbuschmann die in hiesiger Gegend viel vorkommende Palme. Essbar sind von dieser sowohl die etwa apfelgrossen Früchte, deren Fruchtschale einen süsslichen, an Johannisbrod erinnernden Geschmack hat, als auch das weiche Innere des Stammes. Letzteres ist eine weissliche, weiche, von Fasern durchzogene Masse, die von den Buschleuten durch Kochen und Zerstampfen zur Nahrung hergerichtet wird.

3. Eine weisse Pilzart, von den Buschleuten naú, von den Hereros majova genannt; der Pilz wächst in der Regenzeit besonders an den Rändern von Termitenhaufen; der Durchmesser seines Tellers erreicht etwa 20 *cm*. Gegessen wird er in rohem und gekochtem Zustande. Ob tatsächlich überreicher Genuss dieses Pilzes, wie von den Hereros behauptet wird — ejova, plural majova, heisst auf Herero dumm — einen nachteiligen Einfluss auf die Geistestätigkeit übt, ist mir nicht bekannt.

4. Die Unki, eine sehr bekannte, etwa haselnussgrosse Zwiebelart, von den Buschleuten ||au genannt, die sehr häufig vorkommt und einen wichtigen Bestandteil der Küchenvorräte nicht nur der Buschleute, sondern auch der Hereros bildet.

5. Die ||guitcha der Buschleute, ussessenga der Hereros, eine im Geschmack an Kartoffeln erinnernde Knollenfrucht, die geröstet gegessen wird.

6. Eine ähnliche Wurzelknollenfrucht ist die ondubi der Hereros; die Pflanze hat rosafarbene Blüten und lange lanzettliche Blätter.

7. Die árugu (Herero: omakungu), eine Gurkenart. Die Pflanze ist ein Rankengewächs, dessen Früchte denen unserer Gurken gleichen; sie werden etwa fingerlang und nehmen, wenn sie reif sind, eine lebhafte rote Färbung an. Sie werden in Asche geröstet und warm gegessen.

8. Die ||ániba (Herero: maramba), ein kleiner Busch mit einer Bohnenfrucht, ähnlich im Aussehen und Geschmack unseren Saubohnen.

9. Die sng der Kungbuschleute; es ist dies ein grosses Rankengewächs mit doppelt gelappten Blättern, deren mächtige Wurzel von den Buschleuten als Wasserwurzel sehr geschätzt wird. Die Frucht hat die Grösse einer Wallnuss, sie besteht aus zwei Keimblättern, die von einer im frischen Zustand weichen, im trockenen sehr fest werdenden Schale umschlossen sind. Zwischen Frucht und Schale befindet sich eine geringe Menge einer weisslichen schleimigen Flüssigkeit, die das Schaleninnere

schlüpfrig erhält. Die Frucht wird nach Entfernung der Schale getrocknet und geröstet und hat dann den Geschmack der in Ostafrika häufigen Erdnuss. Ihr Genuss hat eine ausgesprochen abführende Wirkung.

10. Die Buschleute kennen ebenso wie die Hereros noch andere Wasserwurzeln; so bezeichnen die Letzteren eine kleinere sehr wasserreiche Wurzel, die die Gestalt und Grösse unserer Runkelrübe hat, mit chue.

11. Die |ŋ-Frucht der Kungleute ist eine Nuss von etwas mehr als Wallnussgrösse, deren in einer harten Schale liegender Kern wie unsere Haselnuss schmeckt. Die harte innere Schale ist noch von einer weicheren äusseren umschlossen, die ausgesprochen süss schmeckt und von den Buschleuten zu einem im Aussehen und Geschmack durchaus an Apfelmus erinnernden Brei gekocht wird.

Über die Kleidung der Heikum ist nicht allzuviel zu sagen.

Die Männer begnügen sich in den meisten Fällen mit einem ledernen Lendenlappen, der vorn und hinten an einem um die Taille gegürteten Riemen befestigt wird.

Die Frauen tragen einen ebensolchen etwas längeren Lederlappen um die Lenden, ein zweites Fell gürten sie sich von einer Schulter zur entgegengesetzten Hüfte.

Die Felle sind der Haare beraubt. Sie werden nach der Abhäutung zwei Tage lang auf dem Boden ausgespannt, der Sonne ausgesetzt, dann enthaart und auf der Innenseite mit einem roten Wurzelsaft eingerieben. So zubereitet werden sie auf längere Zeit in den Boden eingegraben und sind dann verwendungsfähig.

Nicht selten findet man bei den Buschleuten Sandalen, die sie sich in einfachster Weise aus Antiloponfell schneiden. Eine Ledersohle wird durch drei Verbindungsriemen an einem auf der Spannhöhe liegenden, unter den Knöcheln durchgezogenen Riemenring befestigt; von den Verbindungsriemen läuft einer zwischen erster und zweiter Zehe hindurch, während die beiden anderen an der Innen- und Aussenseite des Fusses angebracht sind.

Die Kinder gehen ganz nackt. Bei dieser Spärlichkeit der Kleidung kommt der Sinn für Schmuck doch voll zu seinem Rechte.

Vielen Schmuckgegenständen kommt die Bedeutung von Amuletten zu, die für die verschiedensten Zwecke getragen werden. Die Weiber sind reichlicher geschmückt als die Männer; während letztere sich häufig mit Armringen aus Antilopenleder begnügen, findet man die Frauen gewöhnlich überladen mit Schmuckgegenständen. Ein sehr beliebter Frauenschmuck sind Halsketten aus Straussneischale. Die Schale der Eier wird zu kleinen, etwa pfennigstückgrossen, in der Mitte durchbohrten, kreisrunden Plättchen verarbeitet und an einem Riemen aufgezogen. Aus demselben Material werden auch Arm- und Beinringe hergestellt.

An Stelle der Straussneiplättchen werden zu Halsketten und Armringen häufig erhandelte bunte Glasperlen verwendet. Viele Frauen sieht man mit einem auf der Brust hängenden Schildkrötenschalenkästchen ein-

hergehen, das mit perlenbesetzten Lederstreifen verziert ist und zur Aufbewahrung von Tabak dient.

Auch durchbohrte Wurzelstückchen, die durch natürliche regelmässig eingekerbte Ringe ausgezeichnet sind, werden zu Halsketten an Lederriemen aufgereiht.

Von Schmuckgegenständen, die gleichzeitig die Bedeutung eines Amuletts haben, habe ich die folgenden vorgefunden:

1. Stückchen getrockneten Antilopenfleisches werden auf der Brust getragen in dem Glauben, der Träger werde, so lange er diese Requisiten trage, keinen Mangel an Fleischkost haben.

2. Dieselbe Bedeutung haben getrocknete Antilopenohren, die in einem kleinen Lederbeutel auf der Brust getragen werden.

3. Ein Stück Wurzelholz, |un |gei genannt, wird durchbohrt an einem Bastfaden auf der Brust getragen. Mit diesem Wurzelstückchen hat es eine eigene Bewandnis. Die Buschleute schaben etwas von seiner Oberfläche, wenn sie auf Jagd sind und zum Erblicken von Wild ein helles Auge zu benötigen glauben, in Pulverform ab und streichen sich das Pulver zwischen die Augen und von da aufwärts über die Stirnmitte bis zur Haargrenze. Sie glauben durch diese Prozedur ihre Sehschärfe steigern zu können. Ein Versuch, den ich selbst mit dem Pulver machte, erzeugte auf der bestrichenen Hautpartie keinerlei Veränderungen, hatte natürlich auch auf die Sehschärfe keine ersichtliche Einwirkung.

4. Kleine hölzerne Stäbchen, die als Orakelinstrumente namentlich von den Kungleuten des Kaukaufeldes verwandt werden.

Es sind dies 4 Holzstäbchen, die auf der Brust an einem Faden aufgereiht getragen werden.

Sie haben etwa Fingerlänge und eine Breite von etwa 2 *cm*. Zwei davon sind etwa fingerdick, die beiden anderen nur wenige Millimeter stark; das eine Ende der Stäbchen ist glatt abgeschnitten das andere zugespitzt. Diese 4 Stäbchen werden befragt für alle möglichen Zwecke. Wenn der Buschmann wissen will, wo sich Wild befindet, wo er einen Feind zu erwarten hat, welchen Weg er einschlagen soll, so befragt er seine Stäbchen. Er macht dies in folgender Weise. Vor sich breitet er einen Lederlappen aus und kauert sich nieder. Nun legt er alle 4 Stäbchen parallel übereinander in die linke Hand, den Handrücken dem Boden zugewandt. Mit einem plötzlichen Ruck, begleitet von Zungenschnalzen, wirft er die Stäbchen auf den Lappen; natürlich springen die Stäbchen nach allen Seiten auseinander und weisen mit ihren Spitzen nach verschiedenen Richtungen. Nun bedeutet je nach dem vorliegenden Fall jedes Stäbchen etwas Besonderes. Als ich einen Buschmannkapitän im Kaukaufeld über das Schicksal unserer Patrouille orakeln liess, bedeutete in seinem Wurf eines von den dicken Stäbchen die Ochsenkarre, die die Patrouille mit sich führte. Über die Bedeutung der Stäbchen im einzelnen Falle erhebt sich zwischen dem Orakelsprecher und dem Zuschauer öfters eine lebhafte Auseinandersetzung, bei der schliesslich anscheinend der Angesehenere mit seiner Ansicht durchdringt.

4: Werner FX10 Bushmen

Die Kleidung der Kungleute im Kaukaufeld ist im wesentlichen dieselbe wie die der Heikum am omuramba ua omatako, auch der Schmuck weist keine grossen Verschiedenheiten auf, doch sind mir einige Besonderheiten der Kaukauleute aufgefallen, die ich bei den Heikum nicht gefunden habe. Die Kungs des Kaukaufeldes hatten als Arm- und Halsschmuck Ringe aus Wildebeestschwanzhaaren geflochten, desgleichen Arm- und Beinringe aus gedrehtem Gras; ferner trugen sie Stricke aus gedrehtem Bast in reichlicher Anzahl über der Brust gekreuzt; weiter fand ich im Kaukaufeld Halsringe aus getrockneten und geflochtenen Antilopensehnen, und, in grösserer Anzahl als bei den Heikum, Kupfer-, Messing- und Eisenringe. Die letzteren handeln die Kungbuschleute des Kaukaufeldes von den Ovambos und Betschuanen ein gegen Straussaneier und Antilopenfelle.

Wie die Kleidung so ist auch der Hausrat der Buschleute sehr einfach und bald aufgezählt.

Holzpfannen ohne Henkel von verschiedener Grösse findet man wohl in jeder Hütte. Zum Zerstampfen von Nahrungsmitteln bedienen sich die Buschleute eines zylindrischen mörserartigen Holzgefässes mit dicker Wandung und sehr starkem Boden. Zum Zerstampfen dient ein etwa 30 *cm* langer, 4 *cm* dicker Holzstab.

Als Stühle werden für Europäeransprüche lächerlich kleine Holzschemel verwandt; dieselben bestehen aus zwei kaum handgrossen, kreisrunden Holzplatten, welche durch 2 Holzstäbe verbunden sind, ihre Höhe beträgt etwa 10 *cm*.

Beile sind in den Werften reichlich vorhanden. Sie bestehen aus kleinen Eisenklingen an dicken Holzgriffen. Aus der Form der Beile ist erkennbar, wie der Wert des Eisens Sparsamkeit in der Verwendung dieses kostbaren Metalls nötig macht. Die Wucht des Schlages, die bei europäischen Beilen durch die Schwere des Eisenteiles erzeugt wird, erreicht der Buschmann durch keulenartige Verdickung des Holzstieles am Beilende. Man findet neben Beilen mit längsgestellter auch solche mit querstehender Klinge.

Ein häufig anzutreffendes Instrument ist ein Enthaarungsmesser für Tierhäute. Dasselbe besteht aus einer kurzen querstehenden Eisenklinge, die in einen Holzstiel eingelassen ist.

Als Tabakspfeifen dienen verschiedene Modelle. Die Buschleute, die einen Blättertabak jederzeit im Busch finden, verstehen es ausgezeichnet, sich in kürzester Zeit einen Pfeifenkopf aus einer Wurzelknolle zu improvisieren. Sehr beliebt sind grosse Pfeifen aus dem abgeschnittenen Ende eines Kuduhornes bestehend. Nahe der Spitze des Hornes befindet sich eine Öffnung, in welche eine den Tabak aufnehmende Metallhülse gesteckt wird. Die Schnittfläche des Hornendes wird an den Mund angepresst und der Rauch in tiefem Zuge in die Lunge eingesogen. Sehr häufig findet man auch einfache Patronenhülsen als zwar primitive aber verwendbare Tabakspfeifen. Tonpfeifen, die im Kaukaufelde nicht selten sind, werden von den Betschuanen importiert.

Ein häufig anzutreffendes Küchenrequisit ist ein grosser flacher Holzlöffel mit gebogenem Stiel, der jedoch nicht zum Einführen von Speisen in den Mund verwandt wird, sondern nur zur Füllung von Gefässen. Die Buschleute essen mit den Fingern, ihre Suppen trinken sie aus der gemeinsamen Holzschüssel und schlecken den Rest mit dem gekrümmten Zeigefinger und der Zunge aus.

Als Töpfe finden Kürbisgefässe, die mit Riemen umwunden und an Stöcken auf der Schulter getragen werden, Verwendung.

Als besonderer Luxusgegenstand findet sich in mancher Hütte ein grosser, starkwandiger und mit eingekerbten weissgefärbten Bändern verzierter Tontopf, der aus dem Ovambolande importiert worden ist.

Besonderes Interesse beanspruchen die Instrumente zum Feuermachen. Der Buschmann kennt deren zwei, das dáni und das ‖oro.

Das dáni (dá = Feuer) besteht aus zwei Holzstäben von je etwa 40 *cm* Länge. An einem Ende des einen befindet sich eine pfannenartige Vertiefung, in die das eine abgerundete Ende des anderen hineinpasst. Der Pfannenrand hat einen kleinen Ausschnitt, aus welchem die zu Zunder geriebene, glühende Holzmasse beim Feuerquirlen auf einen glatten Stein entleert wird. Der Buschmann vermag mit diesem Instrument in weniger als einer halben Minute Feuer zu machen.

Das andere dem Buschmann bekannte Feuerzeug ist das ‖oro, ein Feuerstein mit Schlagring und Zunderbüchse, das von den Betschuanen importiert wird.

Ein Instrument, das neben seinem Gebrauch für Lederarbeiten auch medizinischen Zwecken dient, ist eine spitze Eisennadel von etwa 20 *cm* Länge und 3 *mm* Stärke, die fast jeder männliche Buschmann in einem schmalen Lederfutteral bei sich führt. Die Nadel wird von den Buschleuten mit grosser Geschicklichkeit zur Entfernung von Dornen aus der Haut benutzt, eine Dienstleistung, die der Buschmann naturgemäss häufig von seinem Medizinmann in Anspruch nehmen muss.

Ausser den obenerwähnten Jagdgeräten, Wildschlinge und Wildhaken, wurde mir ein mit einiger Kunstfertigkeit bearbeiteter, etwa $1^1/_2$ *m* langer Holzstab gezeigt, der zum Tragen erlegten Wildes auf der Schulter verwandt wird.

Es erübrigt noch, der Waffen der Buschleute Erwähnung zu tun. Dieselben beschränken sich im wesentlichen auf Bogen und Pfeil. Der Bogen besteht aus festem, elastischem Holz, das sich nach den Enden zu verjüngt.

Die Bogensehne wird aus den ausgefaserten Strängen von Gemsbocksehnen gedreht.

Die Pfeile sind von ganz eigenartiger Beschaffenheit. Der Schaft besteht aus einem etwa 60 *cm* langen Stück Binsenrohr, das am unteren Ende gefiedert ist, in das obere Ende wird ein etwa 15 *cm* langes, nach beiden Seiten zugespitztes Elanknochenstück, das durch Schleifen auf Steinen sorgfältig gerundet ist, eingelassen, und zwar so, dass es leicht herausgenommen und umgekehrt wieder eingesetzt werden kann. Das vordere, zur Aufnahme der Knochenspitze bestimmte Ende des Binsen-

4: Werner FX10 Bushmen

schaftes ist mit Bast umwickelt, um ihm die nötige Widerstandskraft zu geben. Die beiden Enden der Knochenspitze erfahren nun eine verschiedenartige Behandlung. Die kürzere und stumpfere Spitze bleibt giftfrei und dient lediglich zu Jagdzwecken. Das längere und spitzere Ende ist mit einer braunen harzigen Giftmasse bestrichen. Über die Herkunft des Giftes ist es sehr schwer, von den Buschleuten etwas Sicheres zu erfahren, sie weichen darauf bezüglichen Fragen verlegen aus.

Ich habe nur das eine in Erfahrung bringen können, dass es von einem chi (Herero: otjindombo) genannten Baume durch Anritzen der Rinde gewonnen wird. Die in den Rindensaft eingetauchte Pfeilspitze wird über dem Feuer erhitzt.

Ausser dem Bogen und Pfeil findet man noch einfache unbearbeitete Kirris und — wenigstens bei den Buschleuten des Kaukaufeldes — Wurfspeere mit Eisenspitzen, die von den Ovambos erhandelt werden.

Pfeilschäfte und -spitzen werden in gesonderten Lederköchern auf dem Rücken getragen.

Zur Erlegung von Geflügel werden auch einfache, gefiederte Holzpfeile mit zugespitztem Ende verwandt.

So einfach wie das ganze Leben der Buschleute sind auch ihre Wohnungen. Sie bestehen nur aus wenig mehr als mannshohen, etwa 3 *m* im Durchmesser aufweisenden Hütten, welche durch Einlassen von Knüppeln in den Boden hergestellt werden. Diese das Gerüst bildenden Stangen vereinigen sich kuppelförmig in der Mitte, die Zwischenräume werden mit Gras gedichtet. Die Tür ist ein kaum meterhohes Loch; unmittelbar hinter derselben brennt fast ununterbrochen das Feuer, so dass das Hineinkriechen in die Hütte für den Europäer wenigstens mit Schwierigkeiten verbunden ist. Nicht selten begnügen sich die Buschleute, die ja wegen Mangels an Feldkost oder wegen der Wasserverhältnisse ihre Werften häufig zu verlegen gezwungen sind, mit der Herstellung unvollendeter Hütten, die nicht zu einem Kreis geschlossen sind, sondern nur einen Teil, gewissermassen ein Segment einer Hütte darstellen und nichts weiter als einen notdürftigen Sonnenschutz bewirken.

Im übrigen ist es erstaunlich, wie abgehärtet die so gut wie nackten Buschleute gegen die in der kalten Zeit sehr empfindliche Nachtkälte — nicht selten unter 0° — sind. An einem kleinen Feuer schlafen sie, abgesehen von ihrem Lendenlappen, unbekleidet ruhig auf dem kalten Boden, der eisigen Nachtluft ausgesetzt, ein Gedanke, der jedem Europäer, der in solchen Nächten nicht ohne drei Wolldecken schlafen kann, ein gelindes Zähneklappern verursacht.

Über die so häufig schon diskutierte Rassenstellung der Buschleute habe ich, wenigstens bezüglich der Heikum und Kung, bereits oben ausgeführt, dass mir die oft behauptete Hottentottenabstammung zweifelhaft erscheint. Die geringere Körpergrösse kann man allerdings mit der Verelendung der Rasse durch Jahrhunderte lang währende ungünstige Lebensbedingungen begründen. Gegen die Rasseverwandtschaft aber spricht die anthropologische Tatsache, dass bei den Heikum- und Kungfrauen

Steatopygie nicht zu finden ist und andererseits die völlige Verschiedenheit der Sprache.

Ich habe versucht, von der Sprache der Heikum am omatako und der Kung im Kaukaufeld eine Vokabelübersicht und einige grammatische Merkmale zu sammeln, die ich unten wiedergebe. Es hat sich dabei herausgestellt, dass die Sprachen der Heikum und Kung nur dialektisch verschieden sind, während sie zum Nama fast keine Verwandtschaft zu haben scheinen. Die Schnalzlaute allerdings sind fast dieselben wie in der Hottentottensprache; es bezeichnet also | den dentalen, || den lateralen, ! den cerebralen und ǂ den palatalen Schnalzlaut. Mit ⁝ bezeichne ich das scharfe Öffnen der Stimmritze im Vokalanlaut, das häufig zwischen einem Konsonanten und einem Vokal oder zwischen zwei Vokalen desselben Wortes liegt und das in dieser Weise im Nama nicht vorkommt.

Die Heikum des omatako sprechen neben der Buschmannsprache auch Nama, während die Kung des Kaukaufeldes nur ihre Buschmannsprache sprechen. Der Grund ist leicht ersichtlich, wenn man sich vergegenwärtigt, dass das Kaukaufeld eine allseitig durch die grossen wasserlosen Strecken der Kalahari umschlossene Oase ist, die nur in der Regenzeit von einigen jagenden Betschuanen besucht wird, sonst aber gänzlich abgeschlossen ist; die meisten der Buschleute, die wir im Kaukaufeld antrafen, hatten bis zu unserer Ankunft noch nie einen Weissen zu Gesicht bekommen.

Wortverzeichnis und grammatikalischer Abriss der Heikum- und Kungsprache.

1. Personen.

Deutsch	Heikum	Kung	Nama

schwach	schui	|χá	subu
tot	|ai oder |é	|e	‖ōb
lebendig	|oa |é	|oa |e	odide
hart	|ang	|áo	gáro
weich	kam	kam	tsau(ra)

9. Pronomen personale.

ich	mē oder mehi	me	dita
du	tschoē ó	tschoē é	saatz

Deutsch	Heikum	Kung	Nama
er	ǎhng	ǎhng	‖ĕib
wir	tschússē	tschússē	sǎta
ihr	ta:ǂǎ	ta:ǂǎ	sado
sie	ǎhng(?)	tschudi tsch:ǂǎ	‖ĕin

10. Pronomen possessivum.

mein	méhng	méhing	ti
dein	tschoē ē(?)	atschi(?)	sa
sein	ǎhng(?)	ǎhing(?)	‖ĕib
unser	tsu |ǎ	wesse tschisch hug(?)	—
euer	mi dsú	mi tsú	—
ihr	i |á	(?)	—

Die mit (?) versehenen Formen sind nicht mit Sicherheit festzustellen.

11. Interrogativa.

wann?	ǂum katewa	—	ma |ub ai
wo?	kole wá	—	má pa
wie?	kole wá	—	mǎ pa
warum?	disse wá	—	dein |ǎroma
was?	atchíssi	atchíssi	táre

12. Pluralbildung.

Im Heikum wie im Kung wird der Plural durch Anhängung von sen an den Stamm des Substantivum gebildet, z. B.:

|a	Auge,	|oí	Haar,
|asen	Augen.	|oísen	Haare.

13. Geschlechtsunterscheidung.

Um das Geschlecht zu unterscheiden, fügt der Heikum und der Kung die Silben \|ō für das männliche, dē oder di für das weibliche Geschlecht dem Substantivum zu z. B.:

Elandantilope \|n
männlich \|n \|ō
weiblich \|n dē oder \|ndi.

14. Konjugation.

A. Präsens.

Im Präsens tritt zwischen pronomen personale und Verbalstamm die Form \|ē di oder a di. ta:a = schlafen,

Deutsch	Heikum	Kung
ich schlafe	mē |ē di ta:ǂǎ	mē |ē di ta:ǂǎ
du schläfst	tschoē ē |ē di ta:ǂǎ	dschoē ē |ē di ta:ǂǎ

Deutsch	Heikum	Kung
er schläft	ahng |ē di ta:ǂ̃ oder a di ta:ǂ̃	ahng |ē di ta:ǂ̃
wir schlafen	tachusse |ē di ta:ǂ̃	tachusse |ē di ta:ǂ̃
ihr schlaft	tah:ǂ̃ |ē di ta:ǂ̃	tach:ǂ̃ |ē di ta:ǂ̃
sie schlafen	tachudi tach:ǂ̃ tachu |ē di ta:ǂ̃	tachudi tach:ǂ̃ tachu |e di ta:ǂ̃.

B. Futurum.

Das Futurum wird gebildet durch Einfügung der Silben \|uma di zwischen pronomen personale und Verbalstamm.

ich werde schlafen	mē |uma di ta:ǂ̃	me |uma di ta:ǂ̃
du wirst schlafen	tachoē ē |uma di ta:ǂ̃	tachoē ē |uma di ta:ǂ̃ usw.

C. Präteritum.

Das Präteritum bildet der Kung durch Einfügen der Silben \|eia di, der Heikum durch Einfügen der Silben na dō zwischen pronomen personale und Verbalstamm.

ich habe geschlafen	mē na do ta:ǂ̃	me |eia di ta:ǂ̃
du hast geschlafen	tachoē ē na do ta:ǂ̃	tachoe ē |eia di ta:ǂ̃

D. Imperativ.

Der Imperativ wird durch den Verbalstamm ausgedrückt.

schlafe	ta:ǂ̃	ta:ǂ̃
gehe	u	u

E. Infinitiv.

Der Infinitiv wird gebildet durch Voransetzen des Präfixes haga vor den Verbalstamm.

schlafen	haga ta:ǂ̃	haga ta:ǂ̃
gehen	haga ú	haga ú

15. Gebräuchliche Wendungen.

wie heisst du?	u |u	tachoe ē oder a tachuē
was sagst du?	atchissi a di koia	atchissi a di koia
wo ist er?	ahng kolewa wá	—
gib mir	na mē	na mē
was willst du?	atchissi wa	atchiss 'a diú
ja	ta:ing	—
nein	koē	koē
komm her	oē	oē

16. Zahlworte.

Deutsch	Heikum	Kung	Nama
1	tachin ǂé	tachin ǂé	|ai
2	tachi dzá	tachidzá	|gam
3	tachin |ǂani	tachin |ǂani	|oná
4	unsicher	unsicher	hagá

Deutsch	Heikum	Kung	Nama
5	|gau	|gau (|gau = Hand)	—
6—9 bei Heikum und Kung durchaus unsicher			
10	|gau ǂeissen (Finger) (Zehen)	|gau ǂeissen	—

Bei Heikums und Kungs kann man mit Sicherheit nur die Bezeichnungen für 1, 2, 3, 5 und 10 erfahren, alle sonstigen Angaben sind unsicher. Bemerkenswert ist, dass 5 mit „Hand" und 10 mit „Hand und Zehen" bezeichnet wird.

Bei Heikum- und Kungbuschleuten ist die Art des Abzählens an den Fingern übereinstimmend.

Zur Bezeichnung von 1 wird der kleine Finger der linken Hand mit dem Zeigefinger und Daumen der rechten Hand erfasst und in die Hohlhand gebeugt; für 2, 3 und 4 folgen dann der vierte, dritte und zweite Finger der linken Hand, die in der gleichen Weise in die Hohlhand gebeugt werden. Um 5 zu bezeichnen, wird die linke Hand mit aneinandergelegten Fingern erhoben. Für 6, 7, 8 und 9 wird mit der rechten Hand in derselben Weise verfahren wie für 1, 2, 3 und 4 mit der linken Um 10 zu bezeichnen, werden die beiden flachen Hände leicht gehöhlt mit ihren Innenflächen aneinandergelegt.

Der Buschmann liebt es, vor Ausführung der Fingerzählbewegung mit der Spitze des kleinen Fingers der rechten Hand kurz die Unterlippe zu berühren.

Ob in der Sprache der Heikum oder Kung der Tonhöhenwechsel der Vokale, wie in der Hottentottensprache, eine Rolle spielt, ist nicht möglich gewesen festzustellen.

JOURNAL OF THE INTERNATIONAL AFRICAN INSTITUTE

VOLUME XXVII JANUARY 1957 NUMBER 1

THE KIN TERMINOLOGY SYSTEM OF THE !KUNG BUSHMEN

LORNA MARSHALL

THE Peabody Harvard Kalahari Expedition, under the leadership of Laurence K. Marshall, has made four field trips between 1950 and 1955 into the Kalahari Desert in South West Africa and the Bechuanaland Protectorate to find and study Bushmen who were living in their own way, and not working for white farmers or for Negroes. The last of the four expeditions, that of 1955, was sponsored by the Smithsonian Institution as well as by the Peabody Museum of Harvard. 121 122

Our principal study was made with the /Kung Bushmen of the Nyae Nyae region of South West Africa. The Nyae Nyae region extends about 150 miles north and south, about 100 miles east and west, and is centred approximately at Gautscha Pan, which is located at *c.* 19° 48′ 30″ S. and 20° 34′ 36″ E. on the map of a survey of the area by the Administration of South West Africa dated 7.11.1935. The Nyae Nyae region is separated from the farmed areas of South West Africa by a stretch of waterless, uninhabited country over 100 miles wide. 131

We chose the /Kung of the Nyae Nyae region for concentrated study because they are the least acculturated Bushmen we found.[1] They are non-literate, nomadic hunters and gatherers, with no agriculture or domesticated animals. They are completely self-reliant [121] 105 177

[1] On the expeditions we travelled extensively in South West Africa and the Bechuanaland Protectorate. The groups of Bushmen we encountered were, in addition to the /Kung of Nyae Nyae, /Kung outside the Nyae Nyae region at Karakuwise, Nuragas, Khadum, and at water holes south of Gum in South West Africa, and at Kai Kai, Kubi and other places along the western border of Bechuanaland, where Chwana and Herero have cattle posts; Makaukau and Naron near Ghanzi, B. P.; /Kõ at Okwa and at Barachu, about 50 and 100 miles south of Ghanzi respectively; /Gikwe about 100 miles south-east of Ghanzi in the trackless sandy plain that lies between Ghanzi and Molepolole, where during the dry season there is no water; and //Ganakwe still farther south, below Chukudu. We studied the kinship terminology of the /Kõ and /Gikwe; Professor L. F. Maingard, for a time a member of the 1955 expedition, studied the /Kõ language, which has the labial (fifth) click of the southern group. [101]

Professor I. Schapera and Miss D. F. Bleek, in their Bushman studies, record information on these groups. For more data on the various names by which the groups are known and the areas in which they were found and the language groups into which Miss Bleek's studies place them, see especially Schapera, *The Khoisan Peoples of South Africa*, New York, 1951, pp. 31 ff., and Bleek, D. F., 'The Distribution of Bushman Languages in South Africa', *Festschrift Meinhof*, pp. 55 ff.

'Africa', the Journal of the International African Institute, is published by the Institute, but except where otherwise stated the writers of the articles are responsible for the opinions expressed.

648 self-reliant. No European farms or institutions such as hospitals, schools, missions, trading posts, labour-recruiting or tax-collecting offices have been established in the Nyae Nyae region. The first government official to go into the region, Mr. Claude McIntyre, Senior Welfare Officer of the Administration of South West Africa, came with our first expedition to Gautscha Pan in 1951. The contact of the /Kung of this region with the neighbouring Bantu-speaking Negro tribes consists of occasional trading trips or visits to their Bushman relatives who are working for Chwana or Herero in western Bechuanaland.

123 We lived for seventeen months with the /Kung of Nyae Nyae; for six weeks in 1951, for fourteen consecutive months in 1952–3, for six weeks again in 1955.

During this time we had several interpreters. We wish to express our gratitude 115 particularly to two, Ngani and Kernel Ledimo, who had an exceptionally intelligent grasp of our purposes and problems and whose work was patient and precise. Ngani (this is his own preferred spelling of his name) is a Heikum Bushman who lived for many years with Mr. Courtney Clark in Grootfontein. Among the nine languages Ngani speaks are /Kung and English. Kernel Ledimo is a Chwana of the Batwana tribe who grew up among /Kung Bushmen on his father's cattle posts and was educated in an English school in Bechuanaland.

121 We made the kinship terminology of the /Kung in the Nyae Nyae region a subject 184 of special study. Our investigation of the /Kõ and /Gikwe kinship terminology shows that there is not one system common to all Bushman groups. This paper deals only with the /Kung system.

124 Our method of study was first to take genealogies of the members of six bands, comprising about 175 persons. This took a good deal of time but was rewarding as a background which helped us to place in their web of relationships most of the 600 [123] /Kung in the Nyae Nyae region whom we came eventually to know by sight or name as we travelled about or as they visited us.

124 After we had gathered the genealogical material we began to ask people what kinship terms they used for each other. We asked many informants, going over and 601 over the same questions. The terms for parents, offspring, and siblings were easily learned. But the terms for grandparents, grandchildren, and all collaterals threw us into confusion. For each grandparent or grandchild, of either sex, we found that a person might use one of two terms (and one of these has an alternate); and a person might use one of three terms for each collateral, with an alternate, a diminutive, and a distinction man-speaking and woman-speaking to complicate matters. The same term might be applied to relatives on either the paternal or maternal side. We did not know for some time what factor determined, for instance, whether a person applied the term *a* or *b* to his FaFa or MoFa or the term *a*, *b*, or *c* to his FaBr, MoBr or some other collateral. When we asked we were usually told, 'It is our custom', but one informant gravely explained that 'God created people and told them what terms to use for each other. Parents have taught their children ever since what terms to use.' It was ≠Toma, perhaps our most intelligent informant, who at last figured out what it was we did not understand and told us what he had assumed everyone knew, that the term 'followed the name'. In other words there is a factor, which we finally called the factor of the name, which under certain circumstances determines what term the individual uses. We began afresh to gather information to understand and

5:Marshall E-5 (1950-1955) 1957 FX10 Bushmen FX10
Kung

601 602 [124]

test this factor and eventually we learned that there are two aspects to the /Kung system of kin terminology. In one terms are applied according to the biological position of the persons; in the other terms are applied because persons are classified with others by having the same names, in ways this paper will explain. The factor of the name has resulted in kin terms being applied by persons who have no consanguineous or affinal ties, but who are considered to be related through the factor of the name in what we call the name-relationship.

114 601

Miss Bleek in her paper on 'Bushman Terms of Relationship'[1] has recorded /Kung terms. Students of the subject interested in comparing her paper with this will find them in agreement to a considerable extent, but Miss Bleek's paper does not go so deeply into the terminology as this does nor does it bring out the significance of the factor of the name.[2]

128

Our material on /Kung kin terminology is presented in two parts. (I) The first part (A) deals with terms applied to consanguineous kin, and explains the factor of the name and the way the application of terms is extended through the factor of the name to persons who have no consanguineous or affinal ties, in what we call the name-relationship; and (B) deals with terms applied to affines. (II) The second part deals with certain aspects of behaviour related to kin terminology, touching briefly upon marriage prohibitions and preferences from the point of view of terminology. It deals more fully with the joking relationship, an aspect of behaviour which relates closely to terminological categories. The paper finally touches upon the way the name-relationship serves as an amalgamating factor within a whole region among people who have no larger organized social units than autonomous bands, small ones of 10–15 persons up to large ones of 40–60 persons, composed of consanguineous kin and their affines.

[184 621]

Space does not permit here a description of the composition of bands, but we hope in a future publication to give data on the family and bands, on hunting and veldkos territories, marriage, residence, settlement patterns, and on the behaviour among kin in forming hunting and gathering parties, arrow-lending, meat-sharing, gift-giving, &c.

[1] D. F. Bleek, 'Bushman Terms of Relationship', *Bantu Studies*, vol. ii (1923–6), pp. 57–70.

[2] Miss Bleek (ibid.) sometimes gives the descriptive phrase in place of, or in addition to, the term, as if we should say father's brother or mother's brother instead of uncle. For instance, *ba siy* is a descriptive phrase meaning father's younger brother or younger sister. There are differences of spelling. We should like to follow Miss Bleek's spelling, but we put down as best we could what we heard and cannot change over to her spelling because in the different areas the Bushmen's pronunciation may possibly have varied slightly. There are some terms given by Miss Bleek which we did not hear in the Nyae Nyae region. The /Kung of Nyae Nyae do not use the term *tsau* for Br. We did not hear *||ge*, nor *soip||ge*, nor *tsa* as a prefix to *siy*. Otherwise the terms we record are recognizable as the same terms which Miss Bleek records. Miss Bleek, on the other hand, does not record all the terms which we record as used in the Nyae Nyae area. The principal difference lies, we think, in her not taking into account the factor of the name. We think she had an inkling of there being such a factor among the /Kung she worked with, for she says they had a word */ku* which she thought meant 'kinsman' or 'namesake'. In any case, she does not show all the terms which in the Nyae Nyae region might be applied to grandparents, grandchildren and collaterals on both the paternal and maternal sides. A detailed comparison of the papers would show several examples, but one will suffice to illustrate the point. Miss Bleek records the terms for FaBr, *tsu*, and MoBr, *tsau||ge*, giving the impression that the /Kung system makes a terminological distinction between the paternal and maternal siblings, whereas we found that in the Nyae Nyae area both terms, *tsu* and *tsau||ge*, might be used for either FaBr or MoBr, and, besides, that the sibling term, elder Br, might also be used for FaBr or MoBr, as will be explained.

Kung

Part I: /Kung Kin Terminology

Some General Principles

601

1. Terminologically no two persons may be simultaneously interrelated in more than one way. Persons may change their terminological relationship by marriage or, under some circumstances, by having their names changed, but when this occurs the former terminological relationship is supplanted by the latter.

2. Except in the relationship of Hu, Wi, DaHu, and WiFa, the relative biological age of any two persons applying kin terms to each other is almost invariably indicated. Either the terms *per se* imply relative age, as do the terms for biological father and son, or the term has a diminutive form which is applied by the older person to the younger.

3. The same terms are used both in address and in reference, except the term for Mo, which has a vocative form as well. In reference, but not in address, the possessive adjective precedes the term, as for instance *mi !ha*, my son. In address children usually double the terms; they say, for example, *tsu tsu*, 'uncle uncle'. The exception to this is the vocative form of the term for Mo which we did not hear doubled.

4. It is to be assumed that the terms are the same, man-speaking (m.s.) and woman-speaking (w.s.), unless the contrary is indicated.

5. In the description of the /Kung kinship system, when we use the English terms without designating relationships more specifically it is because our terminology fits the /Kung system. When we say grandparents we mean precisely to include FaFa, MoFa, FaMo, and MoMo. The terms uncle and aunt include siblings of both of ego's parents and the spouses of those siblings. The /Kung make no distinction between paternal and maternal cousins, nor between cross and parallel cousins, so one can conveniently use the term cousin to include FaBrSo, FaBrDa, FaSiSo, FaSiDa, MoBrSo, MoBrDa, MoSiSo, MoSiDa. When we use the terms nephew and niece we include BrSo, SiSo, BrDa, SiDa.

It will be useful for analytical purposes to distinguish two constellations of 'kin' terminology which we shall refer to as System A and System B. System A is applied to consanguineous kin and to persons classified with them by being named for and by having the same name as consanguineous kin and, in the case of spouses of collaterals, by being married to consanguineous kin. System B is applied to affines.

System A

We distinguish three categories of terms within System A. Category one comprises *parent–child terms*; category two, *sibling terms*; category three comprises two pairs of terms, with an alternate to one of the terms, woman-speaking, making five terms in all. We shall refer to the terms of category three as *generational terms*.[1]

[1] Professor Douglas Oliver, who kindly read and criticized the manuscript, helped us with many excellent suggestions for which we are most grateful. It was he who suggested, among other things, the designation 'generational terms' for this category, and pointed out the generational structure.

5:Marshall E-5 (1950-1955) 1957 FX10 Bushmen FX10
Kung

Here are the parent–child terms:[1]

Fa	ba (b^ha)[2]
Mo	dai[3] (t^hai)
Mo (voc.)	aiya (āiya)
So	/ha (ŋ/^ha)
Da	≠khai (ŋ≠kxai)

These terms are subject to no modification. They are used by a person for no other relatives than his biological parents or offspring and no other terms can be applied in these relationships.

Sibling terms are as follows:

elder Br	/go (/o)
elder Si	/kwi (/kwi)
younger Br or Si	tsĩ (tsĩ)

The above terms are used for both full and half siblings. These terms are fixed to the sibling relationship in the sense that no other terms replace them under any condition; but, unlike the parent–child terms which are applied to no other relationship, the sibling terms are under certain circumstances extended to other relationships than that of biological sibling.

The generational terms are as follows:

Applied to males	*Applied to females*
tsu (tsũ)	//ga (g//^ha)
/gu/na (/uŋ/^ha)	tũn (txũŋ)
tun/ga w.s. (txuŋ.g/a) alternate to /gu/na	

The terms are reciprocal. If a male ego applies the term *tsu* to a man, he is termed *tsu* by that man. Or, if a male ego terms a woman *//ga*, she terms him *tsu*. It is the same with the */gu/na–tũn* pair.

The above statements are subject to the qualification that, when using these terms, the older person invariably uses a diminutive form for the younger person. We shall list the diminutives here, and then, to avoid being cumbersome, omit them henceforth throughout the text. The diminutive is expressed by adding the suffix *ma*,

[1] The spelling of the Bushman terms used in this paper is an approximation. We represented the Bushman sounds as we heard them as nearly as we could without using symbols except for the clicks. The four clicks are symbolized as follows: dental /, alveolar ≠, alveolar palatal /, and lateral //.

[2] Mr. Ernst Westphal of the School of Oriental and African Studies of the University of London, when he visited our expedition at Gautscha Pan, took down the terms in phonetic symbols as /Kung informants pronounced them. We give his symbols in parentheses the first time the term is given. We wish to express our gratitude to him.

[3] Mr. Westphal spells the term for Mo with a *t* (t^hai), as does Miss Bleek (*tai*). Professor Clement M. Doke, in his outline of the phonetics of the language of the /Kung, *Bantu Studies*, vol. ii (1923–6), pp. 130–65, on p. 150 spells it *ŧai*. We feel apologetic about insisting on *dai*, but we thought we heard the voiced sound *d*. We wondered if the *d* derived from *di* which means female and occurs in the term *di/guma* which is applied to persons who have the same name as one's mother (cf. p. 9).

601 'young' or 'small', to the term. In some instances the diminutives used man-speaking are derived from different terms from those used woman-speaking.

Term	*Diminutive*
Applied to males	
tsu	tsuma m.s. w.s. (tsûm^{h}a)
/gu/na	/guma m.s. (/ûm^{h}a) toma w.s. (txwōm^{h}a)
tun/ga w.s.	toma w.s.
Applied to females	
tūn	toma m.s. /guma w.s.
//ga	tsuma m.s. //gama w.s. (g//^{h}am^{h}a)

The generational terms may apply to all lineal kin and to all collateral kin save those related by parent-child or sibling ties.

Ego applies the terms */gu/na* (or *tun/ga* w.s.) and *tūn* to persons in his own generation and in generations alternate with his own; he applies *tsu* and *//ga* to persons in generations adjacent to his own or alternate with these latter.

Thus System A appears as in Diagram 1.

DIAGRAM 1

Terms for lineal and collateral relatives may be continued into the descending generations, alternating as in the ascending generations.

We have already stated that the generational terms *may* apply to all collateral kin 601
and to all lineal kin save those related by parent–child or sibling ties. Up to now we have been assuming, for the sake of orderly procedure, that a /Kung Bushman applies these terms, in the manner specified, to all consanguineous kin solely according to his *biological* position among them. This assumption is correct with respect to the parent–child and sibling relationships; in these instances the biological tie is the sole basis for classifying relatives. But for all other consanguineous relatives, as well as for many other persons besides, a factor other than the biological tie may determine the nature of the terminological relationship. We refer to *the factor of the name*.

The principle underlying the factor of the name is that persons who share the same name occupy identical positions in certain sectors of the kinship constellation we have called System A. Based on this principle, a method of classifying persons terminologically has been developed. We shall refer to this method as the *homonymous method*, and distinguish it from the *generational method* as set out in Diagram 1.

When it comes into conflict with the generational method, the homonymous method takes precedence. It has been developed and extended in the /Kung system more [184]
fully than in the /Gikwe and /Kõ systems, where it exists, but where it has remained minor, and is practised only among persons who do not have consanguineous or affinal ties. The /Kung, on the other hand, make wide use of the homonymous method.

The complicated system by which terms are applied in this method will be ex- 551
plained step by step, but first the customs followed by the /Kung in the naming of children will be described.

1. The /Kung have no surnames.

2. Names are sex-linked, hence men and women never have the same name.

3. Parent and child must not bear the same name in /Kung culture. The /Kung said it would be madness for a man to name a son for himself or a daughter for her mother. Our genealogies of about 175 /Kung show no deviation from this rule.

4. Children are always named for relatives, either consanguineous or affinal, 553
although they may bear the name of a non-related person as a second name. They are named for someone in the first or second ascending generation.

5. Fathers have the right to name both sons and daughters. A man invariably names his first-born son for his father (i.e. the child's FaFa) and his first-born daughter for his mother (i.e. the child's FaMo). If he has more than one wife, he names the first-born son and daughter of each wife for his father and mother respectively. Thus siblings, though they are not named for each other, often bear the same name, having been named for the same person. A man usually but not invariably names his second-born son for the child's MoFa and second-born daughter for her MoMo. Fifty-one per cent. of the /Kung in our records are named for their grandparents. Subsequent children are usually named for the siblings of their father or mother, or for the spouses of those siblings. Very rarely is a child named for other relatives. We have recorded two named for cousins of their parents. It is not their custom, /Kung informants told us, for them to name their children for the children's great-grandparents or for the siblings of the children's grandparents.

6. We have recorded about 46 men's names and about 41 women's names in use [551]
among the 600 people we know in the Nyae Nyae region.

5:Marshall E-5 (1950-1955) 1957 FX10 Bushmen FX10
Kung

553 7. Names are occasionally changed.
[551] 8. Nicknames are in common use. They are usually descriptive of physical characteristics, such as Gow Umbilicus or Gow Beard.

553 601 It must be kept in mind, as the description of the homonymous method of applying terms proceeds, that the /Kung distinguish between being named for, and having the same name as, a person. When one is named for someone, one is brought into the kinship constellation of that person. Merely fortuitously having the same name as someone does not do this to the same degree. We shall at first limit the description to situations where one is *named for* another.

A child is, as we have said, never named for a parent, nor is a child named for a sibling (though they may have the same name). In these categories of relationship, therefore, the homonymous method of applying terms is not operative. In other categories of relationship, however, when a person is named for another, he is, with respect to ego, terminologically taken out of his biological category and classified in the category of the person for whom he is named. Ego applies a term to him according to his homonymous classification.

There are three categories, with respect to ego, into which persons may be classified by their names. (1) The parent–child category: Although ego is never named for his parent, some of his relatives will be. (Some of his nephews and nieces, for example, would certainly be named for ego's Fa or Mo.) When this occurs, ego applies a term to that person which classifies the person with the parent of ego's for whom he or she was named. The terms are *tsu* applied to males, *||ga* applied to females. The terms *ba* and *dai* are applied, as we have said, only to the biological parents. The terms *tsu* and *||ga* are the terms applied to persons in generations adjacent to ego's (i.e. his parents' generation, cf. Diagram 1, p. 6), and are the terms used to classify persons terminologically in the parent category. The same terms would be used for persons named for ego's offspring who again would be terminologically classified as in adjacent generations with respect to ego. (2) The sibling category: If a person is named for ego's sibling, ego classifies him or her terminologically with that sibling and applies the sibling term, i.e. *!go* (elder Br), *!kwi* (elder Si) or *tsī* (younger Br or younger Si). (3) Ego's category: We consider that the third category is basically ego's category and that it includes persons who are classified by name or generation with ego. Persons may be classified in this category by being named for ego, or for ego's spouse, who is of the same terminological generation as ego. The person for whom ego is named and the spouse of that person are in this category. The way people are classified within it will be brought out as the description proceeds, but more information must first be given about the terms associated with it, namely: *!gu!na* (*tun!ga* w.s.) and *tūn*.

The term *!gu!na*, unlike any of the other terms, so far as we know, is a translateable word. *!Gu*[1] means name, *!na* means big or old. The diminutive which derives from the term is *!guma*, small or young name. As terms *!gu!na* and *!guma* always occur modified with the augmentative or diminutive suffix, never simply as *!gu*, the word for name.

[114 194] [1] This is undoubtedly the word which Miss Bleek heard as *!ku* (cf. 'Bushman Terms of Relationship', p. 62). It seemed to us particularly difficult to determine, when a word began with the alveolar palatal click, whether the consonant release was voiced or unvoiced. We have two opinions here, Miss Bleek's *!ku* and our *!gu*. Mr. Westphal hears no consonant, i.e. *!ũ*.

5:Marshall E-5 (1950-1955) 1957 FX10 Bushmen FX10
Kung

553
601

Another term is derived from *!gu*, i.e. *di!guma*. *Di* means female, *!guma* small or young name. *Di!guma* is applied, m.s. and w.s., only to women who have the same name as one's mother and is an alternate to *||ga* in this one sense.

When the generational method of applying terms was described we saw *!gu!na* applied, m.s. and w.s., in ego's generation and the generations of ego's grandfather and grandson, to males only. Woman-speaking, as a generational term *!gu!na* had an alternate, *tun!ga*, which was preferred. *Tũn* is the term applied to females associated with these generations.

When the homonymous method is used the term *!gu!na*, or its diminutive *!guma*, is applied by a male to a male, and by a female to a female. Ego applies the term to persons named for him and to the person for whom he is named. He also applies the term to persons who have the same name as himself, but who are not named for him, with two exceptions: (1) siblings, though they are not named for each other, frequently have the same name, being named for the same person. When this occurs the sibling terms are retained, taking precedence over the term *!gu!na*; and (2) in certain affinal relationships the affinal term is retained even though ego and the affine have the same name (see p. 16).

In addition the terms applied to persons named for ego's spouse are *!gu!na* (or *tun!ga* w.s.) or *tũn*. The affinal terms for spouse are used only for ego's actual spouse. Persons named for the spouse, who is terminologically of ego's generation, have the generational terms applied to them which classify them with ego's generation.

The term *tũn* is applied to a woman who is the spouse of any male whom ego terms *!gu!na* (or *tun!ga* w.s.). *Tun!ga* is the term applied to the spouse of a woman whom a female ego terms *!gu!na*.

Kin who are named for ego's parents or offspring, for his siblings, or for himself or his spouse constitute the basis but not the limit of classification of kin by the homonymous method. Other kin in ego's and in the *descending* generations are classified by ego into the same three categories if they have been named for the kin who were originally so classified. For example, ego applies the term *tsu* to A because A was named for ego's Fa, and he continues to apply the term *tsu* to persons who are named for A, and so forth.

To understand how the method works in the *ascending* generations we must look at the same three categories from another point of view, seeing ego classified with the person for whom he is named, i.e. his *!gu!na*. Ego's *!gu!na*'s parents use the term *tsu* (the 'adjacent' generational term) for a male ego, *||ga* for a female ego, because ego is named for their offspring. Ego's *!gu!na*'s So and Da use the terms *tsu* or *||ga* for ego because ego is named for their parent. Ego's *!gu!na*'s siblings apply a sibling term to ego because he is named for their sibling. And ego's *!gu!na*'s spouse uses the generational terms which place ego in the same generation as the spouse—i.e. *!gu!na* (or *tun!ga* w.s.) or *tũn*, classifying ego with the spouse because he is named for the spouse. In each case ego reciprocates.

It will be more convenient to keep ego's point of view in our illustrations and to express the situation from ego's angle, stating that ego applies the term *tsu* or *||ga* to his *!gu!na*'s Fa, Mo, So, and Da; *!go*, *!kwi* or *tsĩ*, the sibling terms, to his *!gu!na*'s siblings; and *!gu!na* (or *tun!ga* w.s.) or *tũn* to his *!gu!na*'s spouse.

Diagrams will be given to illustrate the homonymous method of applying terms,

19 THE KIN TERMINOLOGY SYSTEM OF THE /KUNG BUSHMEN

128 Diagrams will be given to illustrate the homonymous method of applying terms,
601 but they do not illustrate a typical family. No Bushman family we know has as many
[162 living children as in Diagram 4. Bushmen are completely nomadic and must carry
05 their young children and all their possessions, walking seventy or eighty miles or
807] more as they move from one wild crop of roots or nuts to another. They limit, by infanticide, the number of infants to those they can carry and care for. ≠Toma, one of our informants, helping me one day to construct one of these hypothetical illustrations, laughed and said, 'Who is this who has so many children? Is it an ostrich?'

Diagram 2

601 In this illustration ego's *!gu/na* is his FaFa. Ego's FaBr and FaSi are the So and Da of his *!gu/na*. They and ego use the adjacent generational terms, *tsu* and *//ga*, for each other.

Diagram 3

Here ego is named for his FaBr. In this case ego's FaFa is ego's *!gu/na*'s Fa and ego's FaMo is his *!gu/na*'s Mo; *tsu* and *//ga* are the terms used. Ego's FaBr and FaSi are the Br and Si of ego's *!gu/na*; the sibling terms are used. Ego applies the term *tũn* to the wife of his *!gu/na*.

Diagrams 2 and 3 illustrate ego's application of terms to members of his *!gu/na*'s family. Letters represent names. A person who is designated by the same letter as a person in a generation above him has been named for that person. The naming is customary and correct as far as it goes. Some of the children would be named for their mother's parents or siblings, but, as those persons would be ego's affines, until the affinal terms are given this aspect of the illustrations will be postponed.

There is a secondary application of the terms originally applied by ego to members of his *!gu/na*'s nuclear family and spouse. Ego applies terms to persons who are named for the latter, and continues during his lifetime applying to persons descending from

his */gu/na*'s nuclear family the same terms that he applied to the persons for whom they were named. Diagram 4 illustrates this point.

DIAGRAM 4

Diagram 4 shows terms applied to cousins. In the first instance ego is named for his FaFa, in the second for his FaBr.

Diagrams 5 and 6 show how the homonymous method appears when ego applies terms to persons who are named for himself and his own parents, children, siblings, and spouse, and to the persons who are named for them.

We have been assuming up to this point in the illustrations that ego is named for someone on his father's side of the family. What has been said about the paternal side would be applicable to the maternal side if ego were named for someone on that side. We shall refer to either the paternal or maternal side as the *off-side* if it does not include the person for whom ego is named. Diagram 7 illustrates the application of terms on the off-side.

Unless a person is terminologically taken out of his biological generation through the factor of the name, the terms applied by the generational method are retained.

Grandparents on the off-side are always termed */gu/na* (or *tsu/ga* w.s.) and *tũn*, or, since they are biologically older, it is more precise to say that they apply the term */gu/na* or *tsu/ga* to a male ego, *tũn* to a female ego, and that ego reciprocates. These are the generational terms applied in the generational method, retained because ego is not named for the parent or child of his off-side grandparents, which would require the term *tsu* or *//ga* to be applied.

DIAGRAM 5

601 Diagram 5 shows what terms ego would apply to nephews and nieces, children of his brother D, if the children were named, as they customarily would be, for ego's Fa, Mo, and his siblings. The illustration also shows the terms and the names carried, linked together, into the descending generation. (We use two affinal terms here, BrWi, *tŭn*, and Wi, *tsau*. Cf. p. 16.)

DIAGRAM 6

In Diagram 6 it is assumed, for variety, that ego is a woman. The illustration shows what terms she would apply to her grandchildren if they were named, as they customarily would have been named, by their Fa, ego's son C.

It can be seen in Diagram 6 how it is that grandparents and grandchildren do not fall into the sibling category with respect to each other and are never, therefore, termed */go* and */kwi*, but always */gu/na* (or *tun/ga* w.s.) and *tŭn* or *tsu* and *//ga*. For ego to use the sibling terms [553] for a grandchild, that child would have to be named for ego's Br or Si. This, the /Kung told us, is not their custom.

Ego, being a woman in this illustration, uses the term */gu/na* for her granddaughter A who is named for her. (We remind the reader that, for the sake of brevity, we are omitting diminutive forms. Actually */guna* is the form of the term used for the younger person.) Ego's grandson B is named for ego's husband. */Hoa* is the term for the actual husband. The term */gu/na* is used for someone named for one's husband.

Diagram 7 assumes that ego's uncles H and J (1) retain the 'adjacent' generational term *tsu* for ego for the same reason, namely, that in this case the factor of the name requires no other. Ego's maternal uncle E applies the term */gu/na* to ego because he and ego have the same name. 601

Whereas ego applies the term */gu/na* to anyone either named for or having the same name as himself, in other relationships a distinction is made between being named for someone and merely having the same name. In Diagram 7 it is to be noted that, although ego has a brother named J (3), he does not apply the sibling terms to J (1) or J (2). J (1), assumed to be older than ego, established the term used between them, which is the 'adjacent' generational term *tsu*. As J (2) is named for J (1), not for ego's Br, ego uses the term *tsu* for J (2). He would use the sibling term for someone named for his brother. [553]

DIAGRAM 7

Ego is named for his FaBr E. This diagram shows terms applied to the side of the family which does not include the person for whom ego is named. Ego is assumed to be younger than his uncles and aunts and older than his cousins.

There is one further complexity which may beset the student of /Kung kin terminology in his effort to understand the principles upon which the application of terms is based. Names may be changed and, when they are, the person is reclassified and the kin terms applied to him or her are changed accordingly. One blazing hot day in the werft I heard old Hama call her little granddaughter *//gama* (diminutive of *//ga*). I felt the whole system, which had caused me so much difficulty and confusion, begin to swirl and dissolve into formlessness, for the child was named for old Hama and, if I understood the system at all, old Hama must call that child */guma* (diminutive of */gu/na*). I fanned myself with my helmet, kept my voice low and asked old Hama if I had heard correctly. 'Oh, yes,' she said. Little Hama's name had been changed, she told me. Her son Gao, the other day when his sister was visiting, had decided to give his sister's name to his daughter instead of old Hama's. Now she and her little granddaughter were *//ga* and *//gama* to each other. Old Hama said she was very disappointed. I was not. I took a deep breath and went on to the next task. 553 601

The Name-Relationship

In the /Kung kinship system, generational and sibling terms are applied to persons who have no consanguineous or affinal ties with ego if they have the same names as

553 ego or his kin or affines. We shall refer to this aspect of the kinship system as the
601 name-relationship.

Among name-relatives, as among consanguineous relatives, it is the biologically older person who classifies the younger with respect to his (the older's) kinship constellation, using the diminutive form of the term for the younger person. The younger person reciprocates.

551 One of the factors in the name-relationship is an ancestral list of names to which
553 terms are linked. Each /Kung has his own individual list to learn, taught to him by his parents and his *!gu!na*. No one could tell us exactly how the list is compiled, but
601 the theory which lies behind the list is that there were among ego's forbears persons whose names required certain terms. (One surmises they were great-grandparents and their siblings and the siblings of grandparents, &c. or perhaps still earlier generations.) Name-relatives who have these names may have had some distant consanguineous connexions. Ego no longer knows, but the old people knew, and in following their teaching ego knows he is following his proper homonymous pattern. Every informant had such a list and told us what term he linked with every name we knew. Some had more than one term linked with a name. ≠Toma used the term *tũn* for women named Khwova who came from the Gum region and *!kwi* for Khwovas from the north. His parents, he said, told him to do this.

553 There is a system of applying terms to name-relatives. Ego is in the place of first
601 priority in the sense that invariably the term *!gu!na* is applied to any name-relative having the same name as himself. Furthermore, ego applies terms to the Fa, Mo, So, Da, sibling and spouse of a *!gu!na* who is a name-relative having the same name as himself, as he does in the case of the person for whom he is named. However, this is carried no further. He does not apply terms to persons named for these name-relatives and he does not apply terms to the nuclear family and spouse of a person he terms *!gu!na* unless the *!gu!na* has the same name as himself.

The term *tsu* is invariably applied to any male name-relative who has the same name as ego's Fa, *||ga* or *di|guma* to any female name-relative with the same name as ego's Mo.

[114 There are gaps in our knowledge at this point; confusion in the data was not re-
551] solved. We think, but are not certain, that next in order comes the ancestral list, taking precedence over siblings, children and spouses as a source of terms to apply to name-relatives. We think the terms applied to name-relatives derive mainly from the ascending generations, except *!gu!na*, applied to persons with the same name as ego's. To illustrate, take a man named Bo. Unless Bo is ego's name, or the name of ego's Fa, ego would use for Bo the term which was linked to the name Bo on his ancestral list. We think that, even if Bo were the name of ego's Br or the Hu of a female ego, the sibling or spouse term would not take precedence over the term linked with the name Bo on the ancestral list. We are certain that the ancestral list does take precedence over ego's children as a source of terms for name-relatives.

We have been assuming that the name occurs on the ancestral list. If a person
[551] should come along whose name was not on his ancestral list, but was the same as one of ego's consanguineous kin or affines, ego would apply the term to that person which he applies to the consanguineous kin or affine. (In the case of an affine ego would use a kin term corresponding to the affinal term, not the affinal

5:Marshall E-5 (1950-1955) 1957 FX10 Bushmen FX10
Kung

term itself. Cf. System B, p. 16.) We know of no rule to prevent a name-relative being classified with any consanguineous kin or affine should his name not be on ego's ancestral list. 553 601

Supposing a name did not occur on ego's ancestral list but did occur several times among his contemporary consanguineous kin and affines, the question arises as to which kinsman or affine would be the one with whom ego would classify a person of that name. We have no precise data on this point, but we think that consanguinity takes precedence over affinity, or the near over the more distant relationship.

The spouses of kin are always paired terminologically with the kin (see p. 18), but this is not true of name-relatives. Ego establishes the name-relationship with each person of a married couple individually. It was in this connexion that we learnt of an aspect of the /Kung system which has not yet been mentioned.

Informants told us that ego may apply a term to the parents and children of an individual name-relative on the generational basis, if he has no term established by his ancestral list. If ego's term for a man is */gu/na* he may apply the term *tsu* to that man's Fa and So, observing the same alternation of the terms */gu/na* and *tsu* that is apparent in Diagram 1.

In this connexion informants told us furthermore that ' boys follow their fathers, girls follow their mothers ', meaning that a son is classified with respect to his father and a daughter with respect to her mother. Assuming that ego applies the term *tsū* to a woman, he could apply the term *||ga* to her Mo and Da. If ego applied the term *tsu* to that woman's Hu, he would use the term */gu/na* for her HuFa and for her So.

We think ego would use this method only if the parent or child of the name-relative had a name for which ego had no term. The /Kung in the Nyae Nyae region had so many name links that we did not observe people applying terms to parents and children of name-relatives in this manner.

There are a few additional terms to be mentioned. Co-wives of polygynous marriages use the terms */kwi*, elder Si, and *tsī*, younger Si, for each other, unless they have the same name, in which case they retain the term */gu/na*. 601 [595]

Step-father is *ba-tsu*, step-mother is *dai-||ga*, step-son is */ha-tsu*, and step-daughter is *≠khai-||ga*.

Mama is a word, heard often, which is not strictly a kinship term. It is applied m.s. and w.s. to any male or female when people wish to express pleasure, gratitude, or affection and it includes an element of respect. It is applied so frequently to grandparents that it becomes almost an alternate to the terms. [576]

System B

The second constellation of kin terms applies to affines. Whereas a person ' enters ' System A initially by way of biological ties and/or homonymy, he ' enters ' System B by way of marital ties—of himself, of his offspring and of his siblings. 601

We shall designate as ' primary ' certain affinal relationships which have a factor in common, namely: terms applied in these relationships are linked to the relationship, as the parent and child terms are linked to those relationships; nothing changes them. The method of homonymy is not practised. Furthermore, when a person comes into one of the primary affinal relationships with ego, ego drops whatever term he

601 previously used and adopts the term which is linked to the affinal relationship, even if the person has the same name as himself.

The primary affinal relationships comprise: the spouses of siblings; ego's spouse; the parents and siblings of ego's spouse, and the spouses of the latter; the spouses of ego's offspring and their parents.

Three pairs of terms are applied exclusively to affines: (1) */hoa* (man), Hu, and *tsau* (woman), Wi (these have no diminutives); (2) *≠tum* (≠ᵗum), dim. *≠tumma* (rare), and */utsu* (/'utsu), dim. */utsuma*; and (3) */umba* (ŋ/um.ba), dim. */umbama* and */undai* (ŋ/un.tʰai), dim. */undaima*. The diminutives are not always used among affines. The older person sometimes uses the term itself for the younger.

	Applied to males			*Applied to females*	
	Affinal term	*Term applied to kin named for affine*		*Affinal term*	*Term applied to kin named for affine*
		Ego's generation			
Hu	/hoa	/gu/na w.s. *or* tun/ga w.s.	Wi	tsau	tũn
SoWiFa, DaHuFa	/umba	/gu/na *or* tun/ga w.s.	SoWiMo, DaHuMo	/undai	tũn
		Generations adjacent to ego's			
HuFa, WiFa, DaHu	≠tum	tsu	HuMo, WiMo, SoWi	/utsu	//ga
		The sibling category			
SiHu	tun/ga m.s. tun/ga w.s.	tsu m.s. /gu/na w.s. *or* tun/ga w.s.	BrWi	tũn m.s. /utsu w.s.	tũn m.s. //ga w.s.
HuBr	tun/ga w.s.	/gu/na w.s. *or* tun/ga w.s.	HuBrWi	/kwi w.s.	/kwi w.s.
WiSiHu	/go m.s.	/go m.s.	WiSi	tũn m.s.	tũn m.s.
WiBr	tun/ga m.s.	tsu m.s.	WiBrWi	/utsu m.s.	//ga m.s.
HuSiHu	≠tum w.s.	tsu w.s.	HuSi	/utsu w.s.	//ga w.s.

The term *tun/ga* is applied exclusively to affines, man-speaking. Woman-speaking, *tun/ga* is used as a generational term, an alternate to */gu/na*, and is also applied to affines. (The diminutive of *tun/ga* is *tun/gama* m.s. and *toma* w.s.) The generational term *tũn* m.s., and the sibling terms are also used for affines.

Consanguineous kin of ego's may be named for any of the primary affines, for instance, his grandchildren for his SoWiFa or SoWiMo, &c. The exclusively affinal terms are not used for those consanguineous kin, but generational or sibling terms are used which correspond with the affinal terms. The reason for the correspondence between the terms will become apparent when we discuss the joking relationship later on (see pp. 19, 20). The terms are listed below. The siblings of spouses show a 'cross' and 'parallel' pattern. The sibling who is the same sex as ego's spouse corresponds to the */gu/na* (or *tun/ga* w.s.)–*tũn* category, the sibling of opposite sex corresponds to the *tsu*–*//ga* category. Spouses of ego's spouse's siblings correspond in the same way. An informant explained the use of the sibling term */go* for WiSiHu,

5:Marshall E-5 (1950-1955) 1957 FX10 Bushmen FX10
Kung

saying, 'That man and I married sisters. We are therefore like brothers.' The same analogy could be made for HuBrWi, */kwi*.

There is a group of affines we call 'secondary' to distinguish them from primary affines. They differ from primary affines in that terms are not linked to the relationship as terms are to the primary affines but, as in the case of collateral kin, terms may be applied by either the generational or the homonymous method.

Diagram 8

Diagram 8 illustrates the application of terms to secondary affines by the generational method. Ego's BrWi (*tũn* m.s., */utsu* w.s.) is the point of reference.

The secondary affines comprise the parents, children and siblings of primary affines who are not themselves primary affines, such as SoWiFa, or consanguineous kin, such as grandchildren.

The terms applied to secondary affines are the generational and sibling terms combined with the affinal terms */umba* and */undai*, i.e. *tsu-/umba* and *//ga-/undai*; */gu/na* (or *tun/ga* w.s.)-*/umba* and *tũn-/undai*; */go-/umba* and */kwi-/undai*; *tsĩ-/umba* and *tsĩ-/undai*. Though it is strictly correct to use the combined term, many people dropped one or the other part in addressing each other, especially */umba* or */undai* if speaking to children.

The homonymous method takes precedence and terms are applied to secondary affines in the same way as they are applied to name-relatives. In actual practice ego

5:Marshall E-5 (1950-1955) 1957 FX10 Bushmen FX10
Kung

601 and most of the persons who eventually become his secondary affines would be name-relatives. They keep whatever term they had and add *!umba* or *!undai*. Theoretically, if they should not have a name-relationship they would fall back on the generational method.

When terms are applied to secondary affines by the generational method, the primary affine is the point of reference. Ego applies a term to the parent or child of the primary affine which is in the alternate generation terminologically to that of the primary affine. A term in the same generation terminologically as that of the primary affine is applied to the sibling of the primary affine. The list of terms on p. 16 shows the correspondence of the generational terms with the affinal terms. Diagram 8 (p. 17) illustrates this situation.

Consanguineous relatives of ego's may be named for secondary affines as well as primary affines. When they are, ego applies to them the same term which he applies to the secondary affine but drops *!umba* and *!undai*.

All relatives to whom the generational and sibling terms are applied, except name-relatives (see p. 15), have terms applied to their spouses by ego which are paired with the generational and sibling terms as listed below.

Generational or sibling term for males	*Spouse*	*Generational or sibling term for females*	*Spouse*
tsu	//ga or /utsu (//ga is preferred for FaBrWi or MoBrWi; /utsu is preferred in other relationships)	//ga or di/guma	tsu or tun/ga m.s. (tsu is preferred for FaSiHu and MoSiHu; tun/ga is preferred in other relationships)
/gu/na	tũn	tũn	/gu/nã or tun/ga w.s.
tun/ga w.s. when collateral when affine	tũn w.s. /kwi w.s.	/gu/na w.s.	tun/ga w.s.
/go or tsi	tũn m.s. /utsu w.s.	/kwi or tsi	tun/ga

Part II: Some Aspects of Behaviour as Related to Categories of Kin

Marriage

842 The /Kung know that biological descent is from the father and mother, believing that the father's semen unites with the menstrual blood of the mother to form the child But their language does not emphasize the concept of blood as ours does. A 602 /Kung speaks of a person who has blood ties with himself as being of his own people, emphasizing the phrase in some way, as when we say ' very own '.

582 Marriage with any consanguineous kin is forbidden in /Kung culture. This pro-684 hibiton is quite strictly obeyed. The very thought of marriage with a parent, offspring or sibling is horrifying to the /Kung. They could hardly be brought to talk about such ' bad things '. They told us about a man who married a woman and her

daughter at the same time. Although he had blood ties with neither, this was analogous to marrying a daughter and it was thought the man must be mad to do so. Informants said specifically that /Kung do not marry uncles or aunts because they are 'like' parents. Cousins, they say, are 'like' siblings and nephews and nieces 'like' offspring. Marriage with any of these would be shocking. 582 684

In the genealogies of about 175 /Kung of the Nyae Nyae region there is no instance of marriage among any of the above-mentioned relatives. However, we heard of two first-cousin marriages among some distant /Kung. 582 [183]

A /Kung must not marry a person who has the same name as his parent. In the two instances we know where this rule was broken the people lied, admitting it only after someone else told us about it. A man must not marry a woman to whom he applies the term *|utsu* (this seems to be regarded as a particularly stringent prohibition), nor may a woman marry a man she terms *≠tum*. We know a man who broke this rule. His marriage with his *|utsu* caused a scandal which was still reverberating after two years. [553 183] [684]

The preferred marriage among /Kung is with a non-consanguineous name-relative whom ego terms *!gu!na* (or *tun!ga* w.s.) or *tũn* m.s. SiHu and HuBr are both termed *tun!ga* w.s. and BrWi and WiSi are termed *tũn* m.s. These are considered desirable marriages, especially the sororate, but neither the sororate nor the levirate is obligatory. [587]

Marriages with persons termed *!umba* or *!undai* are not forbidden. Persons who use the terms *tsu* and *||ga* for each other may marry unless one has the name of the other's parent. Persons who use the sibling terms may marry. These marriages, though not forbidden, are not preferred.

There is no category of persons with whom sexual intercourse is permitted by /Kung custom except the spouse. If illicit sexual intercourse is indulged in, it is carefully concealed. 837

The Joking Relationship

The joking relationship is an important element in /Kung culture. It is in the foreground of people's minds. The /Kung never once mentioned the generational aspect of their kin terminology system but whenever kinship matters were discussed they spoke of the joking relationship. The /Kung do not train their children to know the precise genealogical position of collaterals,[1] but they teach them the term to use and the joking status of the term. Sometimes an informant would not know whether, for instance, a relative he termed *tsu* was his FaBr, his MoBr or who, but would say that his parents taught him to use that term for the relative and that he must not joke with him. 602 [867] 601 602

The joking relationship creates a dichotomy which divides consanguineous kin, affines, and name-relatives into two groups. Every kinship term is associated with a joking status and the culture either allows ego to joke or prohibits him from joking with every person to whom he applies a kinship term.

[1] As to lineal kin, all our informants knew the precise genealogical position and names of their grandparents and grandchildren but many did not know the names of their great-grandparents. (We did not meet any /Kung who had a great-grandchild.)

601 The sibling category is divided on the basis of sex. Ego jokes with a sibling of
602 the same sex as his own and is prohibited from joking with a sibling of opposite
[593] sex. This creates a 'cross' and 'parallel' pattern which is observed in the use of the terms, man-speaking and woman-speaking, among persons classified by name with siblings and among affines of the sibling category.

Sex is not the differentiating factor with respect to the joking relationship among groups of kin apart from siblings. All other consanguineous kin, affines, and name-relatives are grouped in the joking or non-joking dichotomy according to their categorical classification, as follows:

Ego has the joking relationship with anyone of either sex who is classified with himself or herself, to whom ego applies the term */gulna* (or *tunlga* w.s.) or *tũn*. Consanguineous kin may be so classified by generation (i.e. cousins) as shown in Diagram 1, or by the factor of the name, i.e. the person for whom ego is named or persons named for ego. Ego has the joking relationship with grandparents and grandchildren unless the factor of the name places ego terminologically in the other, non-joking, division. Among affines, ego has the joking relationship with his or her spouse, and
607 also with BrWi and WiSi, *tũn* m.s., and SiHu and HuBr, *tunlga* w.s., who are all considered suitable persons to marry. Ego may joke with affines termed */umba* and */undai*, who are in ego's generation terminologically as they are his offspring's spouses' parents. Persons named for any of the above affines would be termed */gulna* (or *tunlga* w.s.) or *tũn* by ego and ego could joke with them. He could joke also with any name-relatives to whom he applies these terms.

608 Joking is prohibited with parents and offspring of either sex and with anyone of either sex who is classified with them by being of the same generation, when the generational method of applying terms is used, or by being named for them, when the homonymous method of applying terms is used; or with name-relatives classified in this category. Joking is also prohibited with affines associated with this category, i.e. parents of spouse, and spouses of offspring. The terms which are associated with the non-joking status are the parent–child terms, and *tsu*, *||ga* or *dilguma*, and the affinal terms, *≠tum*, *tunlga* m.s. and */utsu*.

When informants were trying to explain the joking relationship to us they had an additional statement to make about the prohibition of joking. They said that, as they must not joke with their parents or offspring, in like manner they must not joke with a person and the offspring of that person. This concept is doubtless associated with the generational method of applying terms. It is not thought to be a contradiction or inconsistency to joke both with a person and the offspring of that person when the homonymous method of applying terms is followed. When a person is named for another his biological position is disregarded and he is terminologically classified with the person for whom he is named. The homonymous method is never applied nor the biological position disregarded in the nuclear family or among primary affines.

Joking, of course, is always reciprocal; if ego may joke with A, A may joke with ego. If B is named for A, the term which ego applies to B always has the same joking status as the term he applies to A. Ego's joking status is the same with both persons of a married couple (cf. p. 18), except in the case of name-relatives with whom he assumes his status individually (cf. p. 15).

5:Marshall E-5 (1950-1955) 1957 FX10 Bushmen FX10
Kung

The following table gives the joking status of each term. 601 602

Consanguineal kin			*Affines*		
Ego's generation and alternate generations					
Joking permitted

The jokes which are permitted among persons who have the joking relationship, 602 and which are avoided by others, are sexual jokes and insults. Anyone may make jokes that are not sexually tinged. Persons who have the joking relationship constantly use it and enjoy it. Men accuse each other of excessive preoccupation with sexual intercourse or of having genital organs of excessive size or abnormal condition (castration or circumcision). Men accuse women with whom they may joke of being

602 ugly, slovenly, or wanton. The women retaliate, perhaps accusing the men of being worthy only of castration or of unfaithful wives. We noticed that the /Kung do not call each other sons of bitches. They are not concerned with lineage.

602 It is not thought proper to make blatant or insulting sexual jokes with old persons. 888 The deference which is shown to aged persons is expressed by moderation, and the joking relationship between an old person and a considerably younger person, [603] especially between grandparents and grandchildren, becomes a cosy friendly intimacy without the sexual emphasis.

Though the /Kung enjoy the joking relationship, it was our impression that their 602 primary concern lay in the prohibition against joking. They said it would be 'madness' to joke with persons they should not joke with. When they meet strangers they do not dare to joke until they find out whether or not it is proper for them to do so. They gave us /Kung names. This placed us in the scheme of things and people could know what their status was with us.

The /Kung say they 'fear' (*koa*) to joke when they should not and they 'fear' (*koa*) the persons with whom joking is forbidden. The word *koa* is the same word that they use when they say they fear a lion or a mamba. They also use it to mean avoid. We think it holds the same combination of fear and respect that our word holds when we say we fear the Lord.

[828 A /Kung told us that joking was not only amusing but that it served a good pur- 865] pose in teaching people, young men especially, to hold their tempers and to have poise in their social relations. We thought that joking served a good purpose in [182 providing an outlet in laughter for aggression and various social restraints, but we [154 wondered if it had not primarily been developed as a response to restraints upon sexual intercourse. Incest must be a concern among a people who live in small bands 835] of consanguineous kin and close affines, bands which are isolated for the most part within their own territories except for more or less infrequent visits to other bands. The restraints which are considered to be good and necessary may be strengthened by the symbol of avoidance of sexual joking. Respect due to a parent has perhaps come to be associated with this symbol and this may account for joking being restricted with parents of both sexes. It seems that respect in general is not required between siblings; only sexual restraint is required and this is symbolized by the restriction in joking imposed on siblings of opposite sex, whereas ego may joke with a sibling of the same sex. It is possible that the culture allows joking between grandparents and grandchildren (with the rather few exceptions when the factor of the name intervenes to classify them in the non-joking category) because joking is associated with a welcome ease and intimacy of relationship and the great difference in age removes the necessity of symbolizing sexual restraint between them.

The Name-Relationship as a Factor in Social Consolidation

553 The /Kung believe that the name is somehow a part of the entity of a person and 601 that when one is named for a person one partakes of that person's entity in some way and in some degree. Informants could give us no further elucidation of this belief.

It seems evident that, when incorporated into the system of kinship terminology, [174] the belief has produced the homonymous method of applying terms. It is our conjecture that the homonymous method was added to the system after the generational method had been established.

method had been established. The /Kõ and /Gikwe have not incorporated the belief 553
into their terminological systems except in a very limited way. The /Kung, however, 601
have done so, and appear to have adapted it as logically as possible to the generational
method. They apply it only to somewhat distant relationships, namely, grandparents, [184]
grandchildren, collaterals, secondary affines, and name-relatives. They do not apply
it in the close biological relationships of parent, offspring or sibling or in the primary
affinal relationships. Consistency is maintained by the rule that a child must not be
named for a parent.

We think that the term *!gu!na* came into the system with the homonymous method 174
and that perhaps it used originally to be applied only to the person for whom ego is
named. It is not strictly a kinship term, being composed of translateable words, ' big 601
or old name '. We think it may have been superimposed upon *tun!ga* (which probably
comes from the same root as *tũn*). *Tun!ga* may originally have been applied to grandfather, man-speaking as well as woman-speaking, and later *!gu!na* may have become associated with grandfather because so many men are named for their grandfathers. If this is so, an anomalous situation remains unresolved. *Tun!ga* is applied to consanguineous kin and affines and allows joking, woman-speaking. Man-speaking, it is applied only to affines and prohibits joking. If it was originally the term for grandfather, man-speaking, we reason that it should allow joking, and we cannot explain this anomaly.

Whatever may be the answer to these questions, the /Kung have put to good use 553
the belief that persons who have the same name partake of each other's entities. This 601
belief has given them the name-relationship. 602

It is our impression that the practice of applying terms to name-relatives has appealed to the /Kung and that they have developed it to the full. The /Kung apply a kinship term to every /Kung they meet or almost everyone. /Qui was the only informant who worked with us on this subject who had ever met a /Kung Bushman for whom he had no kinship term. He had met four who came from a distance and whose names were not among those commonly used in the Nyae Nyae region. Ta//ne was one of the names. Gao, who was present, told /Qui that he had a *tsu* named Ta//ne, and he and /Qui nodded together in agreement that they would find a way for /Qui to give Ta//ne a term should they meet again. We know two men who used the term *!go* for each other because each of them had a brother named Dam. The system seems to have been flexible and expansive in the application of terms to name-relatives.

The /Kung are small of stature and non-aggressive. They are timid and apprehensive of strangers. Their word for stranger is *ju dole*. *Ju* means person, *dole* means 602
strange or harmful—one word for both concepts, in the /Kung language, as though 609
they were a single concept. The /Kung have no social organization larger than the [181
band of kin who live together but they have utilized the name-relationship to supply 105
the cohesive factor which is supplied in other societies by various social structures. 553
When a /Kung meets a stranger and finds that he has the same name as one of his kin 619]
and bestows a kinship term upon him, he is reassured and feels a sense of belonging.

Gao, the brother of /U, went on an errand for us to Khadum. Khadum is about 115 miles north of Gautscha and about 40 miles north of Cho/ana where we were staying at the time. He had never been to Khadum before, and the /Kung Bushmen who lived

5:Marshall E-5 (1950-1955) 1957 FX10 Bushmen FX10
Kung

602 there at once called him *ju dole*. He was in haste to say that he had heard that the father of one of the people at Khadum had the same name as his father and that another had
609 a brother named Gao. 'Oh,' said the Khadum people, in effect, 'so you are Gao's *!gu!na*', and they took him to their fire and gave him a present of edible gum.

602 The name connexions of the /Kung of Nyae Nyae extend throughout the region. Thinking of Gautscha Pan as approximately the centre, the name connexions extend
619 about 80 miles to the south, and include the /Kung who live at Gum and at a few small water-holes south of Gum. To the north of Gautscha Pan they extend about 75
182 miles to Samangaigai, and about 100 miles to Cho/ana, and may be said now to touch upon Khadum, 115 miles from Gautscha Pan. The country to the west, between Gautscha Pan and the farmed area of South West Africa, is waterless and uninhabited. To the east the /Kung name connexions reach some 60 or 80 miles to the cattle posts of Chwana and Herero at Kai Kai and Kubi, where some /Kung work as herdsmen and others visit and trade. The /Kung who live in this region are not *ju dole* to each other. The name-relationship makes them feel they are one people.

619 But there are edges to this sense of being one people. At Karakuwise to the north-west, about 100 miles away from the centre of the Nyae Nyae area, and at Nuragas, about 200 miles away, there are /Kung Bushmen. Although none of the Nyae Nyae people have been there, the people of Nyae Nyae know that those people speak the same language. However, the Karakuwise and the Nuragas people are distant, and they are *ju dole*. The people of Nyae Nyae say that they hear that the people of Nuragas put a strange poison into the pipes they give you to smoke which makes you become as thin as a stick and then die. The people of Nyae Nyae do not know the names of the people at Nuragas.

Résumé

000 LA TERMINOLOGIE DE LA PARENTÉ CHEZ LES BOSCHIMANS /KUNG

Les Boschimans /Kung sont des chasseurs et des ramasseurs nomades, qui ont eu très peu de contacts avec d'autres tribus ou avec des Européens; ils vivent en petites bandes de parents consanguins et d'affins proches, qui sont, pour la plupart, isolés à l'intérieur de leurs propres territoires, sauf pour des visites plus ou moins rares par d'autres bandes. Le système /Kung de terminologie de parenté présente deux aspects: d'après l'un, les termes sont appliqués suivant la situation biologique des personnes; d'après l'autre, les personnes sont classées avec d'autres, du fait qu'elles ont les mêmes noms. Du point de vue terminologique, deux personnes quelconques ne peuvent être apparentées simultanément de plus d'une façon, bien qu'elles puissent changer leur rapport terminologique par le mariage, ou, parfois, par le changement de leurs noms. En général, les termes employés indiquent l'âge biologique relatif des personnes qui s'appliquent mutuellement des termes de parenté. Les mêmes termes sont utilisés en s'adressant à une personne et en y faisant allusion. Pour les besoins de l'analyse, on peut distinguer entre deux systèmes de terminologie de parenté: le système A s'applique à des parents consanguins et aux personnes classées avec eux, soit par suite d'un rapport entre leurs noms, soit parce qu'elles se sont mariées avec ces parents. Le système B s'applique aux affins. Il y a trois catégories de termes dans le système A, selon leur emploi entre: (1) père ou mère et enfant; (2) 'siblings' (enfants de mêmes père et mère), et (3) générations. Dans cette dernière catégorie, la personne plus âgée emploie invariablement une forme diminutive en s'adressant, ou en faisant allusion, à la personne

5:Marshall E-5 (1950-1955) 1957 FX10 Bushmen FX10
Kung

plus jeune. Dans les rapports entre parent et enfant, et entre siblings, le lien biologique constitue la seule base de la classification, mais pour tous les autres parents consanguins, ainsi que pour bien d'autres personnes encore, le nom est le facteur qui peut déterminer la nature du rapport terminologique. Le principe fondamental de ce rapport est que les personnes qui partagent le même nom occupent des positions identiques dans certains secteurs du système A. Cette méthode de classification terminologique est connue sous le nom de la méthode *homonyme*, afin de la distinguer de la méthode des *générations*. Lorsque les deux méthodes sont en désaccord, la méthode homonyme prime sur l'autre. Les /Kung n'ont aucun nom de famille; les hommes et les femmes, ainsi que les pères et les enfants, n'ont jamais le même nom. On donne à un enfant le nom d'un de ses parents consanguins ou affins de la première ou de la deuxième génération ascendante. Donc, c'est la personne qui, du point de vue biologique, est la plus âgée, qui détermine le terme qui sera employé; à vrai dire, elle applique le terme à 'ego' (autrement dit au 'moi'), et ego fait de même. Les /Kung font une distinction entre le fait d'avoir reçu le nom d'une autre personne et celui de porter simplement le même nom qu'une autre personne. Quelqu'un à qui l'on donne le nom d'une autre personne est enlevé de sa catégorie biologique et est classé dans la catégorie de la personne dont il porte le nom.

Les personnes peuvent être classées à l'égard d'' ego ' dans trois catégories nominatives: père ou mère – enfant, sibling, et la catégorie d'ego; cette dernière catégorie comprend les personnes qui sont classées par nom ou par génération avec ego. Lorsque le nom d'une personne est changé, elle est reclassée et les termes de parenté qui lui sont appliqués sont modifiés en conséquence. Un facteur important dans le rapport des noms est une liste ancestrale de noms auxquels les termes sont liés. Le système B s'applique aux affins. Dès qu'une personne entre dans un des rapports affinaux primaires avec ego, ego abandonne le terme qu'il employait précédemment et adopte le terme qui est lié au rapport affinal, même si cette personne porte le même nom que lui. Les rapports affinaux primaires comprennent les épouses de siblings, l'épouse d'ego, le père et la mère et les siblings de l'épouse d'ego, etc. Les rapports affinaux secondaires comprennent les pères et mères, les enfants et les siblings d'affins primaires, qui ne sont pas, eux-mêmes, des affins primaires. Le mariage avec un parent consanguin, ou avec une personne qui porte le nom de son propre père ou mère, est défendu. Le mariage est contracté de préférence avec une personne qui est apparentée du fait qu'elle porte le même nom, mais qui n'est pas consanguine. Les rapports sexuels ne sont autorisés qu'avec son conjoint. La parenté à plaisanterie est importante et divise les parents consanguins, les affins et les personnes qui sont apparentées du fait qu'elles portent le même nom, en deux groupes. Un individu peut plaisanter, ou non, avec chaque personne à laquelle il applique un terme de parenté et le rapport est toujours réciproque. Les plaisanteries sont ordinairement de nature sexuelle ou injurieuse, mais on montre de la modération et du respect envers les personnes plus âgées. Le rapport, du fait de porter le même nom, constitue un facteur important dans le raffermissement social, car les /Kung appliquent un terme de parenté à chaque /Kung qu'ils rencontrent et les rapports, du fait de porter le même nom, s'étendent sur une région très large.

N/OW

LORNA MARSHALL

N/ow[1] is a belief concerning rain and cold which is held by the /Kung Bushmen in the region around Nyae Nyae in South West Africa.

About ten inches of rain falls in an average year in this part of the Kalahari Desert and sinks into the deep sands. There is no run-off in streams and there are few water holes. The rain is sufficient to support a covering vegetation of grass, shrubs, and scrubby trees. The vegetation includes numerous edible roots, tubers, leaves, fruits, and nuts, for which the Afrikaans language provides the convenient word *veldkos*.

The /Kung, the only inhabitants of the interior of this particular region, are nomadic hunters and gatherers. If the rains are poor and the veldkos dry and sparse, the people suffer. Rain, they say, is life-giving; sun is death-giving.

Summer is the season of the 'big rains' in the western Kalahari. 'Little rains'—a few scant showers—may fall in September, October, and November. The 'big rains' begin in late December or January and continue into March. The summer storms are awesome. Every day the winds drive monstrous clouds around the sky, which domes a horizon as flat as the sea. They breed the storms. Lightning streaks from them. Thunder roars and rumbles. The earth sucks in their deluges, hissing.

The /Kung say that thin clouds which give no rain are male. They call them */now*.[2] The big rain clouds are female. White ones they call *//ga kwe disi*—*//ga* means cloud or rain, *disi* means females.[3] The enormous grey clouds with rain pouring from them the /Kung call */kwesi* (zebras), because they are so fleet and, though a person may think he is far from the rain, it comes swiftly and is on him. We have seen Bushmen, caught without shelter in the storms, shivering so that their teeth chattered, saying they could perish in such rain.

Rain itself is male and female, */ga /go* and */ga di*. The men one day drew in the sand the spoor of male and female rain. Male rain spoor was made with all five fingers held stiffly and plunged deeply into the sand, to make big holes. Male rain breaks the trees and beats down the fruits, the men told us. It is (like) a fight, and may kill a person. Thunder and lightning accompany it, and sometimes hail. Female rain has tiny drops and does not spoil anything; it beautifies the trees and the grass and makes the veldkos grow. Its spoor was made by smoothing out a place in the sand and covering it closely with tiny dots. Gao said a person (anyone) may speak to the rain, saying, 'You are doing very well', or, 'Fall silently. Don't make such a noise. Don't be

[1] We wish to thank both Dr. Mary Douglas and Professor I. Schapera for reading the manuscript about *n/ow* and for making several helpful suggestions.

[2] The /Kung language has four clicks: / is the symbol for the dental click, ≠ for the alveolar, / for the alveolar palatal, and // for the lateral.

[3] We did not know how to translate *kwe*, which occurs very often. It seemed sometimes to be a sort of article and we did not work on it especially. We regret not having done so because Miss Bleek, in her *Bushman Dictionary* (American Oriental Society, New Haven, Connecticut, 1956), records in the Auen or //K"au-//en language, which she says is very like the /Kung and which she places south of the /Kung, the phrase *//ga -k"wisi*, meaning rain's hair or cloud. In /Kung *//ga* and *//ga* both mean rain. We now wonder if *kwe* should be *kwi* and if it means hair in the phrase *//ga kwe disi*.

dangerous.' When they do they use the word *n/oi*. It is a word for gentle rain, and also a respect word. They use it for male rain when they are afraid of it and avoid its real name, */ga /go*.

The rains of the western Kalahari are local, falling from clouds which the winds herd. They may fill one pan and miss another. Laurence Marshall spent one whole night, tentless, in a drenching downpour, to find in the morning that a mile away no rain had fallen. But by and large the rains are sufficient in quantity and well enough dispersed to fill most of the water-holes, pans, and hollow trees, and to revive the growing things, so that the autumn months, which follow the rains, are good—the best of the year. Then the /Kung may travel anywhere within their territories to hunt and gather the fresh veldkos. The rains are life-giving.

Winter is the season of dryness. It is also the season of burning sun in the cloudless sky by day and freezing cold when the sun sets. Bitter winds catch up the sparks of the fires at night and whirl them in blazing streaks into the darkness. If water is left in an open bowl, it may be ice in the morning. By mid-winter, July, there has been no rain for three or four months. The pans and small water-holes are dry. Though there are still foods to be gathered, like the mangetti nuts in the northern forest, there is no water on the route, nor in the white sand dunes where the mangettis grow, and the people cannot carry enough in their ostrich-egg shells to go to the mangettis and return. In 7,500 square miles of the interior of the region around Nyae Nyae, there are only five water-holes which do not dry up in the winter and spring. The /Kung bands must gather around whatever permanent water-hole they belong to and restrict their hunting and gathering trips to conform one way or another to the problem of water. This region, incidentally, does not abound in tsama melons and, though there are succulent so-called ' water ' roots to be found, they seem not to be sufficient to support whole bands for long. The Nyae Nyae bands, it appears, cannot, or at least do not, base themselves for long periods away from their water-holes.

The spring months which follow the dry months of winter are the dangerous months. The sun is scorching. Fruits and leaves shrivel; the edible roots, stirred by the few tantalizing drops of the little rains, or just because it is spring, give up their juices to the first new shoots and are dry and bitter to eat. The people longingly await the rains, saying it is the sun which dries the water-holes and the plant foods. The /Kung of this region use one word for both sun and dryness, */kam*, and say the sun is death-giving.

In their beliefs about *n/ow*,[1] which they think influences the weather, as this paper will describe, they make an antithesis between rain and cold. This seems paradoxical when one experiences the devastating heat of the sun in September, October, and November, but the resolution of the paradox may lie in the fact that the hardships of the dry seasons begin with the rainless winter months and their bitterly cold nights, so that sun, dryness, cold and want become a complex which is in antithesis to rain and plenty. *N/ow* is called ' bad ' if it brings cold, ' good ' if it brings rain.

Mrs. Hoernlé[2] records a Hottentot belief called */nau*. The word appears to be

[1] We spell the /Kung word *n/ow* in this way because it rhymes with ' how '. We wish to distinguish it from another /Kung word, */nau*, which it closely resembles, but which has a slightly shorter, more closed sound. */Nau* means ' old man ', according to Miss Bleek's *Bushman Dictionary*. We heard it used as a term of respect in addressing old men.

[2] Hoernlé, Agnes W., ' Certain Rites of Transition and the Conception of */nau* among the Hottentots ', *Harvard African Studies*, ii (1918), pp. 71–77.

821 171 192 similar to the /Kung word *n/ow* in sound but refers to a different belief. In the /Kung belief, *n/ow* influences rain. The Hottentot concept of */nau* supposes a state of being which exists when people are in periods of crisis in their lives. Professor Schapera[1] says of the state of */nau*, summarizing Mrs. Hoernlé's analysis:

> All periods of crisis in the life of a Hottentot involve his separation from his usual surroundings, his preparation for a new group in society, and, finally, his reception into this group. A person in such a crisis is exposed to danger on every side; he must retire from contact with other people, and take special care of himself. But he is also a danger to other people, and more especially to the animals and other living things upon which the community depends for its livelihood. Hence he is secluded, and must abstain scrupulously from his usual tasks.
>
> Such a person is said to be */nau*. It is essential that he be initiated, as it were, with the least possible delay into that group of his people already possessing the new characteristic he has acquired, in order that he may have a normal place in the community once more.

Remarried persons or persons newly widowed are examples.

171 796 821 [114] Mrs. Hoernlé records a rain ceremony of the Hottentots which has several elements in common with the /Kung belief about *n/ow*. The Hottentot ceremony is called the *guri≠ab* (yearly killing).[2] Professor Schapera's[3] description of the *guri≠ab*, which follows, is, as he says, based mainly on Mrs. Hoernlé's account.

> . . . It [the ceremony] is held, if possible, on the banks of a stream, and if there is no stream near by, then a trench is dug to simulate one. When the old men judge that the summer rains are due (about November or December), they tell the chief that it is time to hold the yearly feast, and he sends word to all the outlying families, and decides the time and spot for the ceremony.
>
> Each family contributes according to its means, all bringing milk, and those who can, some female animal, a cow or a ewe, which must be pregnant. The feast cannot be held at all without one pregnant animal. . . . fires are lit to cook the meat for the feast. In addition a fire is lit on the banks of the stream for the special part of the ceremony. The animals are killed and cut up very carefully, so as to preserve intact the uteri, which are kept till after the feast. Eating apparently goes on most of the time until all the food is finished.
>
> When the fire at the riverside is ready, and a channel has been made to the river or stream, the old men of the tribe who are good at prophesying take the uteri, hold them over the fire and pierce them with sticks so that the uterine fluid flows directly through the fire and down the river. At the same time milk in plenty and fat from the animals are thrown on the fire, so that liquid really flows, and great clouds of smoke rise into the sky. Meanwhile all the people round gather together in a great tribal dance, calling on *Tsui ||Goab* to send the rain in plenty, to make the ground soft and the grass green, so that they may have plenty of food for the year.

The uterine fluid, the fire and clouds of smoke rising into the sky, and the association of the ceremony with rain are the elements in the Hottentot belief which are similar to the elements in the /Kung Bushman belief of *n/ow*. But, though there are these interesting common elements, the /Kung concept differs largely from the Hottentot *guri≠ab*.

[3] Schapera, op. cit., p. 379.

N/ow of the /Kung is something which influences weather, bringing rain if it is 821
'good' *n/ow*, or cold if it is 'bad' *n/ow*. Precisely what *n/ow* consists of was never made explicit. Nothing about it can be seen. One knows of its existence, the /Kung say, by observing its effects upon the weather.

N/ow exists in all human beings, the /Kung believe, and in certain big animals, 821
namely: giraffe, eland, gemsbok, kudu, hartebeest, and wildebeest. For the sake of 825
brevity I shall refer to these animals as the *n/ow* animals. Small animals do not have *n/ow*, according to the /Kung. We wanted to learn why, but the /Kung could only tell us that they were so created. Steenbok have positively no *n/ow* at all. Some informants claimed that duikers had none, others said that duikers' *n/ow* was undeveloped. Informants were also uncertain about springbok. There are very few springbok in the region and informants said they killed them so seldom that they had not observed whether or not they had *n/ow*. Possibly other large animals would be found to have *n/ow* if the question were further pursued.[1] There was no disagreement among /Kung 821
informants about other things; no other things have *n/ow*—not earth itself, nor vegetation nor other objects on earth; not water, clouds, rain, thunder or lightning, nor heavenly bodies. Not even the two Gods themselves have *n/ow* in them, neither [776]
the great one who lives in the eastern sky, nor his namesake (his */guma*) who lives in the western sky, both of whom bear the names Huwe, Hishi, and ≠Gao/na, our informants told us.

N/ow gets into a human being in the womb. Exactly how this happens informants 821
could not tell us. It was our impression that they were not hiding information, for 843
they seemed willing enough to talk about *n/ow* and said it was not dangerous or 827
harmful in any way to speak freely about it. We think they simply did not know. One informant said, 'The child gets the *n/ow* in the womb and is born with it.' Another said, 'The *n/ow* is created in the womb.' Another said, 'The great Creator gives the [776]
n/ow and taught the people to do the things they do about it. He made all things and made all things to be known.' The *n/ow* acquired in the womb remains in a person all his life.

Some persons get a 'good' rain-bringing *n/ow*, others get a 'bad' cold-bringing *n/ow*. When we wanted to learn how this happened we were told that 'When the mother's uterine fluid flows into the ground, it makes a *n/ow* in the child which brings rain or a *n/ow* which does not bring rain'.

The mother has no voluntary control over this, nor has anyone else; and there is nothing, like medicine or magic, spell or ceremony, which can be used to cause the *n/ow* to be one kind or the other. Furthermore, the child does not inherit a good or bad *n/ow* from his mother or father or any ancestors. The philosophy, lore, or belief about the question of what causes the *n/ow* to be one or the other kind, whatever it may have been in the past, seems not to be known now with clarity or detail.

Two verbs were used in connexion with *n/ow*: to *≠gani* and to *||ghui*. The /Kung 192
say that the mother has *≠gani*(ed) the child if it gets a good *n/ow* and has *||ghui*(ed) it if 827

[1] Miss Lucy Lloyd (*A Short Account of Further Bushman Material*, *Third Report*, London, 1889, p. 19) mentions that a Bushman informant, Dia/-kwain by name, who worked with her and with Dr. Bleek before his death, and who came from the Katkop Mountains, south of the Orange River, told her that 'A baboon, when killed, resembles a man, in "making cloud"'. No more information was given in the report, but the concept of 'making cloud' suggests that possibly the now extinct or almost extinct Cape Bushmen had a belief which may have resembled in some ways the concept of *n/ow*. [171]

192 it gets a bad *n/ow*. We heard the words used constantly in connexion with *n/ow* and
827 rain and cold, but know of the use of only one of them in another connexion. The /Kung say that a child '*//ghui*(s) its name' if its teeth come late. We do not know precisely how to translate the words and hope that a linguist will some time throw more light on them.

821 ≠Toma, one of our informants, pondering on the question of how the *n/ow*
827 comes to be of one kind or the other in a person, said he thought the child's position
843 in the womb and whether the child had long or short legs might have something to do with it, but he was not sure of this, and knew no more to tell us. A caul or a breech-birth does not make the *n/ow* good or bad, he thought. Other informants
[845 thought that severely deformed infants or twins might possibly be more likely than
847] others to get a bad *n/ow*, but they too were uncertain. (Possibly this is because deformed infants and the weaker one of twins are killed at birth by /Kung mothers, so there is little occasion to think about the *n/ow* of such children.)

821 It is discovered what kind of *n/ow* a child has by observing the weather at the time
787 of its birth or soon after. If it rains the people believe the *n/ow* of the child has brought the rain and are sure the *n/ow* is good. If water should freeze when the child was born or soon after, the child's *n/ow* would be known to be bad. Should the weather continue in its normal seasonal course and no great extreme or notable change occur, the child's *n/ow* will be thought to be probably of the rain-bringing or cold-bringing kind according to the type of weather which prevailed; but if the weather is extreme at the time of the birth there is a feeling of certainty about the kind of *n/ow* the child has acquired, as the /Kung believe the effect of the *n/ow* was clearly observable.

At death as well as at birth the *n/ow* of a human being influences the weather. A /Kung told us that his *n/ow* had brought heavy rain when he was born and that everyone knew he had a rain-bringing *n/ow*. He said his mother, who lived at some distance from where he lived, noticed the weather and, if rain came at an unusual time or was unusually heavy, she feared he had died and that his *n/ow* was causing the rain to come.

821 *N/ow* is said to exist in the bodies of human beings (presumably everywhere in
826 them). Informants mentioned it particularly as associated with uterine fluid at the
[827] time of birth and with the urine and hair of humans.

Hair is associated with clouds by the /Giwke Bushmen in the Bechuanaland Protectorate, with whom we worked in 1955. They have a myth, told to us by the
[773 old headman, Oukwane, which says that God, whose name there is Pisiboro, and who is their one God, tore the black, black hair from his head and threw it into the sky to make the rain clouds.

775 In *Specimens of Bushman Folklore*,[1] Dr. Bleek and Lucy Lloyd record a belief about
821 death, collected in 1875 in the Katkop dialect from the informant Dia/kwain, which
826 refers to hair and clouds. We quote the statement:

> The hair of our head will resemble clouds, when we die, when we in this manner make clouds. These things are those which resemble clouds; and we think that (they) are clouds. We, who do not know, we are those who think in this manner, that (they) are clouds. We, who know, when we see that they are like this, we know that (they) are a person's clouds; (that they) are the hair of his head. We, who know, we are those who think thus, while we feel that we seeing recognize the clouds, how the clouds do in this manner form themselves.

[1] Bleek, W. H. I., and Lloyd, L. C., *Specimens of Bushman Folklore*, London, 1911, pp. 399–401.

The same informant gave more information about 'making cloud'. He said:[1] 821
'And, our gall, when we die, sits in the sky; it sits green in the sky, when we are 826
dead.' His mother told him, Dia/kwain continued, 'that it (thus) happens to us if we 775
sit in the shade when the place is not particularly warm, when it is (only) moderately warm, (and) we feel that the summer seems as if it would be hot. We think: "Allow me to sit for a little in the shade under the bush; for the sun's eye is not a little hot; I will sit a little while in the shade"; (then) we make clouds; our liver goes out from the place where we are sitting in the shade, if the place is not hot. Therefore, we make clouds on account of it. For, when it is really summer, then we (may) sit in the shade.'

We do not know what connexion there may be between the concept of *n/ow* held at present by the /Kung of Nyae Nyae and the /Gikwe myth of Pisiboro's hair making the rain clouds, or the hair of the dead resembling clouds and becoming the dead person's clouds, as Dia/kwain told Dr. Bleek, or a person's gall 'sitting green in the sky', or a person making clouds because his liver goes out from the place where he is sitting in the shade if the place is not hot. We hope someone else may be able to throw more light on this. The /Kung of Nyae Nyae make so little point of teaching 869
old stories or lore to their children that much must be lost.

What the /Kung believe now, Demi told us, is that there is nothing about hair itself which affects the weather. It is the *n/ow* of the person which the hair 'gives'. As we understand it, some of the *n/ow* which is in a person is in the hair. When hair is burned in the fire, the *n/ow* is released into the air in the smell.[2] It goes into the sky and, Demi said, the rain 'fears' it. (*Koa*, the word 'to fear', means to respect, to avoid, as when something is taboo, and to be afraid of.) When a person's urine is burned, it also carries the *n/ow* of the person into the sky.

/Kung informants told us that it would be possible to use the *n/ow* of persons to 789
control the weather, should there be need. If the big rains were unusually late and the 791
people were suffering from the dryness, or if the rain storms were so frequent and 821
heavy that the people had much trouble hunting and gathering veldkos, or if a storm were especially frightening, they might try to start or stop the rain. A person known with certainty to have a rain-bringing *n/ow*, because the weather at his birth had given evidence of it, could be asked either to urinate in the fire or to burn some of his hair. The smell of his urine or hair would go up into the sky and influence the rain to come. A person with a cold-bringing *n/ow* could be asked to do the same to stop the rain, if this were wanted.

We have no observations on who would instigate the burning of urine or hair to 821
control the weather. We did not see it done. No one in a /Kung community is a 791
specialist in rain-making, nor has anyone special authority in making a decision about 123
the control of weather. The medicine men (*shamen*) have as their function the curing of the people, not the control of weather. It would be in keeping with the practice of the /Kung of this region, as we observed it in other connexions, for the group to 623
come to a consensus by talking the matter over informally as they sat by their fires, 821
and then for the parents or someone else to bid a child urinate in the fire. It seems to 789
us unlikely that an individual would make the decision entirely alone, without speaking

[1] Ibid., p. 399.
[2] Cf. a myth about the Rain Bull, which refers to the smell of burning horns, p. 239.

623 about it to others, unless it were a hunter caught in a storm alone in the veld; but
821 an individual, even without necessarily expressing a consensus, we think might say
789 to another, 'Why don't you burn some of your hair?', which would probably be enough to instigate the act. And, in all likelihood, it would be done with so little formality that the observer would not know anything was happening unless he knew what to watch for and were alerted.

[171 There was no ceremony regularly performed by the /Kung of Nyae Nyae to ensure
821] plentiful rain, like the Hottentots' *guri≠ab*. The Rain dance of the /Kung, which is
789] danced often, all through the year, is a medicine dance, among several others, such
535 as the Giraffe, Sun, Gemsbok, Honey, and Mamba dances. All these are 'strong'
776 things, the /Kung believe. The dances so named have 'strong' medicine music. They
755 are danced during the medicine men's ceremony to cure the sick and protect the people and drive away any of the *//ganasi*, the spirits of the dead, who might be lurking to bring some evil upon the people. The Rain dance has this as its purpose, not the control of weather.

One night when the Rain dance was being beautifully danced with a fine precision and vigour of clapping, singing, and stamping, which to us suggested fervour, we were watching it so intently that we had not noticed the sky. The first storm of the season had crept up behind us and suddenly burst over us like a bomb. We asked
[821] Gao if he believed the dance had brought the rain. He said that the rain was due to come. The dance had not brought it.

821 A *n/ow* animal, as well as a human, has either a good or a bad *n/ow*, but it seems
825 not to be known clearly how it gets the one or the other. Good or bad *n/ow* is not correlated with one sex or one species. One giraffe, for example, either male or female, may have the rain-bringing, another the cold-bringing kind.

It seems that long or short horns may have something to do with good or bad *n/ow*, not the long-hornedness of gemsbok as compared with the short-hornedness of giraffes, but, within the species, the comparative length of horn. But one kind of *n/ow* is not inherent in short-hornedness nor is the other kind in long-hornedness. It is not so simple as that. And informants did not know what association, if any, the short or long horns may have with ≠Toma's vague idea that the short or long legs of a child in the womb might have something to do with the child's *n/ow*.

When a hunter kills a *n/ow* animal, he either *≠gani*(s) or *//ghui*(s) it. Like the mother who *≠gani*(s) or *//ghui*(s) her child at birth, the hunter has no voluntary control over this and cannot tell which he has done unless the effect is observed in the weather. A hunter with good or bad *n/ow* may *≠gani* or *//ghui* an animal which has either good or bad *n/ow* and long or short horns. The precise nature of the interaction remains obscure, but hunters took an interest in telling about the kind of *n/ow* they thought they had, and gave instances of observing the effects of their killing various types of animals. If a man should kill a female kudu with short horns and the water should freeze that night, it would be evident that he had *//ghui*(ed) the animal. He would expect to continue to *//ghui* short-horned female kudus. However, although a man's *n/ow* remains constant throughout his life, the way it interacts with other factors may change, and after a time he may find he has begun to *≠gani* short-horned female kudus. We think the /Kung became a little tired of our finding this complicated.

One day in September the sun blazed in the clear sky. The heat beat down upon us.

A party of /Kung men had gone hunting towards the west. John, our son, was with 821
them. In the afternoon there appeared in the western sky three little white clouds, like 825
three powder-puffs in a neat row. They were the first clouds to be seen since the big rains had ended in March. We ran to each other, pointing them out. People felt happy. In the evening, when the hunters returned, ≠Toma came at once to me, before he put down his bow and quiver, and said that I could see for myself what it meant to ≠*gani* an animal. John had ≠*gani*(ed) the wildebeest he shot, and the clouds had appeared immediately above them. ≠Toma said this was what he had been trying all along to explain to me.

If a hunter knows with certainty that he has ≠*gani*(ed) or ||*ghui*(ed) an animal, as it 821
was known when John killed the wildebeest that he had ≠*gani*(ed) it, he may take the 825
horns and the scalp and forehead bone and hang them in a tree, remembering where 789
they are and whether they had been ≠*gani*(ed) or ||*ghui*(ed). If need should arise he could get the horns which were appropriate to the need and burn them in a specially made fire away from the cooking-fires. He would take a piece of the burning horn and point it to the sky saying '*goichi goichi goichi n/ow qui*'. This we were told is 'speaking *n/ow*'. The interpreters did not know and could not find out by questioning people what the words mean. We wonder if they are an archaic spell. The horns must be entirely consumed by the fire.

In *Bushman Folklore*[1] there is a reference to the burning of horns in a very interesting 773
myth about the Rain Bull, related to Dr. Bleek in 1878 by a Bushman from Strontbergen (30° S., 22° E.) whose dialect included the fifth click of the southern group, as the Katkop dialect does. In this myth a young woman cleverly saves herself from being carried away on the back of the Rain Bull to the water-pit where she would have been turned into a frog, and all of her people also would have become frogs. At the end of the myth the informant who related it said, 'The old women who had been out seeking food were those who came to burn horns, while they desired that the smell of the horns should go up, so that the Rain should not be angry with them.'

A hunter has another way of controlling the weather. To bring rain he would cut 789
the throat of an animal he had reason to believe he habitually ≠*gani*(ed), or to stop 821
rain, one he habitually ≠*ghui*(ed). The blood, which is ordinarily saved and eaten, 825
would be allowed to flow on to the ground. A giraffe is the best animal for blood- [262]
letting. The forms and colours of the clouds are like giraffes, the /Kung remarked. We asked if human beings cut themselves and used their blood to start or stop rain as they do their urine or hair. The /Kung said, No, they did not. That would be unnecessarily painful.

As far as we know the /Kung did not attempt to control the weather by these means 183
while we were with them, as they did not resort to burning urine or hair of persons. 789
Perhaps this was because the weather took its normal, expected, seasonal course. 821
Furthermore, we did not experience its most severe extremes for very long periods, [132]
and found it on the whole quite bearable. Or perhaps the concept of controlling weather by means of burning urine, hair or horns or letting blood, exists more in lore than in active practice. Or perhaps the long unchanging months do not stimulate the idea of actively attempting to control weather and the people content themselves with 789
explaining rather than controlling. They appeared in many instances to have the 821

Kung

789 attitude of accepting resignedly what befell. It seemed to be in keeping with their
821 habits of thought that Gao said to us, ' When Bara comes (the season of the rains) and the rains do not fall, we desire and wait.'

Résumé

LE N/OW

000 La *N/ow* est une croyance des Boschimans /Kung de la région autour de Nyae Nyae, dans l'Afrique Sud-ouest, touchant la pluie et le froid. Il tombe dix pouces environ de pluie au cours d'une année moyenne dans cette partie du désert du Kalahari, ce qui est suffisant pour maintenir une végétation de couverture comprenant de l'herbe, des arbustes et des arbrisseaux. Cette végétation, désignée *veldkos* en langue taal, comprend de nombreuses racines, feuilles, fruits et noix comestibles. Les /Kung, seuls habitants de l'intérieur de cette région, sont des nomades qui vivent de la chasse et de la cueillette. Ils ont à subir de grandes difficultés si les pluies sont insuffisantes et il en résulte que le veldkos est sec et épars. Ils disent que la pluie est vivifiante et que le soleil est mortel. Les grandes pluies tombent en été; elles commencent fin décembre ou en janvier et persistent jusqu'en mars; quelques averses rares tombent quelquefois au cours des mois de septembre, octobre et novembre. Les /Kung considèrent les nuages minces, qui ne donnent pas de pluie, comme étant du sexe masculin, et les gros nuages comme des femelles. La pluie elle-même est mâle ou femelle suivant la force avec laquelle elle tombe. Les mois d'automne qui suivent les pluies sont les meilleurs mois de l'année et les /Kung parcourent la région en faisant la chasse et la cueillette du veldkos nouveau. L'hiver est la saison sèche, avec un soleil brûlant pendant le jour et un froid glacial pendant la nuit; la plupart des mares se tarissent. Le *n/ow* est une chose qui influence les conditions atmosphériques et on l'appelle ' néfaste ' s'il apporte le froid et ' bon ' s'il apporte la pluie. Le *n/ow* n'est pas visible, mais on croit qu'il est présent dans tous les êtres humains et dans certains grands animaux; toutefois, il n'existe dans rien d'autre. Le bon ou le mauvais *n/ow* s'introduit dans un enfant avant sa naissance et il demeure chez cet individu pendant toute sa vie. Il n'y a aucun moyen de modifier l'espèce de *n/ow* qu'une personne possède et ce *n/ow* n'est pas héréditaire. L'espèce de *n/ow* est révélée en observant les conditions atmosphériques au moment de la naissance de l'enfant, ou peu de temps après. Le *n/ow* d'un être humain peut aussi influencer les conditions atmosphériques au moment de sa mort. Il existe dans le corps et il est associé avec le liquide utérin, l'urine, et la chevelure. L'association entre la chevelure et les nuages est constatée parmi d'autres tribus boschimans, mais le rapport n'est pas très clairement défini chez les /Kung. Ils croient qu'une partie du *n/ow* appartenant à un individu se trouve dans la chevelure et que lorsque les cheveux (ou l'urine) sont consumés dans le feu le *n/ow* est dégagé dans l'air avec l'odeur. Il monte au ciel et la pluie ' en a peur '. De cette façon, il deviendrait possible d'utiliser le *n/ow* des gens pour faire tomber ou arrêter la pluie. Étant donné que les /Kung n'ont pas de ' faiseurs de pluie ' officiels, ni de rites pour invoquer la pluie, la cérémonie aurait probablement lieu d'une façon officieuse, de manière à échapper à l'attention des observateurs. Les animaux peuvent également avoir un bon ou un mauvais *n/ow* mais le fait d'en posséder un n'a aucun rapport avec le sexe ou une espèce quelconque. Un chasseur peut tuer un animal, de façon à influer sur les conditions atmosphériques, mais, dans ce cas, c'est une question de chance et non pas de choix. Il peut également garder les cornes et les brûler, afin d'invoquer la pluie, ou trancher la gorge de l'animal en laissant le sang couler par terre. Cependant, les /Kung n'ont fait usage d'aucune de ces méthodes pendant le temps que l'auteur est resté parmi eux, sans doute parce que le temps a suivi son cours normal ou parce que les /Kung sont habitués à accepter ce qui advient.

FOREWORD.

X137 312 151 224 823 124

The Kalahari is not a sandy desert in the sense that it is devoid of vegetation; it is the absence of surface water which makes the region such a hazard to human habitation. It is the last refuge of the Bushman. Primitive though he is, he survived in this inhospitable environment owing to his acute powers of perception and his fine appreciation of the gifts of nature. He is a skilled hunter with his bow and arrow and has an intimate knowledge of the natural resources of food and water. Dr. Story compliments him by saying that his knowledge was usually imparted cheerfully and with humour and "always with intelligence".

121

The Division of Botany was grateful to accept the invitation for Dr. Story to accompany the Harvard-Smithsonian-Peabody expedition of 1955. This was the fifth expedition of its kind and had as its objective the further documentation of the way of life of the Bushman. Dr. Story's assignment was to investigate the plants used by them in obtaining food and water.

It is inevitable that, with the advance of civilisation, the remnants of this interesting race will lose its intimate contact with nature and in the end its very identity. Wishing to complete their records before this happens the Harvard-Smithsonian-Peabody organisation, is, as we go to press, returning on yet another expedition. The Division of Botany is glad of this opportunity to continue the collection of data on the plants of economic importance to the Bushmen in the Kalahari.

The balance in nature between supply and demand is of endless interest to the ecologist. In times of plenty—when vegetation is abundant—the animal population increases: in times of poverty—when the vegetation is reduced by the prevailing climatic conditions—the animal population is reduced by the effects of hunger and thirst. So it is with the primitive human, who is dependent for his survival on the animal and plant life which surrounds him. Overpopulation at any time spells destruction for him at a later date. It is obvious too, that primitive man must have had a strong influence on the distribution and density of edible wild plants. Some will have become more widespread and others less numerous. More X C137 and more examples of rare species among the tuberous rooted *Asclepiadaceae* have come to light during the botanical exploration of southern Africa. It is felt that the edibility of these and some other tuberous rooted plants, in a large measure, accounts for their sparse distribution.

Dr. Story's observations support this view, and many other interesting facts are recorded in his preliminary report on the vegetable aspect of the Bushman's diet.

R. A. Dyer,
Chief: Division of Botany and
Director of Botanical Survey.

Pretoria,
October, 1957.

INTRODUCTION.

Early in 1955 the Chief of the Union Government Division of Botany 121
received a request through the British Museum for a botanist to accompany the Harvard-Smithsonian-Peabody expedition, which in the winter of that year was to make a study of the Bushmen of the Bechuanaland Protectorate and South West Africa. The duties of the botanist would be to investigate and report upon the plants used by the Bushmen in obtaining food and drink, and this task was assigned to me in my capacity as one of the Botanical Survey Officers of the Division of Botany.

I joined the expedition on 10th June at Molepolole, after it had been 122
some weeks in the field, and we thereafter travelled along the route shown on the map, reaching Windhoek on 2nd September.

There were two main areas of study, one in the country south of 133
Ghanzi and the other north of Ghanzi. The southern area, part of the Kalahari Desert, was remarkably uniform in every way. The surface [134]
was deep loose sand, gently undulating and with occasional shallow depressions of firm dark soil known as pans, which collect a little water after rain. We did not see a hill after leaving Molepolole until the Ghanzi area was reached, nor a stone, except for shelves of limestone in some of the pans. There was no permanent water in the 300 miles between [312]
Kudumalapshwe and the Ghanzi farms, but Khungwane waterhole and Khomodimo Pan had not yet dried up. Khungwane held one or two thousand gallons and Khomodimo contained a pond about thirty yards across and a foot or so deep. It provided a home, rather unexpectedly, [136]
for a coot (*Fulica cristata*) and a water-scorpion (one of the *Nepidae*). There are no records of the central Kalahari rainfall, but it would be [132]
between 18·5 and 19·6 inches, which are the mean annual figures for Ghanzi and Molepolole respectively. In spite of this low rainfall, and although we were there in the dry season, we found that the sand a few inches below the surface and down to at least three feet was damp enough to retain its form when squeezed in the hand. One specimen of a species 136
of Breviceps was found in the sand, a small burrowing frog which does not swim or jump and which passes through its tadpole stage in a mass of frothy material which surrounds the eggs. The commonest animals were the rodents whose burrows and tracks were in thousands along our route. The game included gemsbok, springbok, hartebees, eland, blue wildebees, giraffe and smaller antelopes and hares. Of the carnivora, lions, leopards, wild dogs, jackals and hyaenas were present. Ostriches and bustards were seen and occasional small birds of various species, but birds were on the whole poorly represented. The vegetation was mainly grassland, usually 137x
about four feet tall and mixed with many shrubs a little taller. Trees were seldom absent for more than a few miles at a stretch, and were scattered to form a parkland or in belts thick enough to hamper the progress of our lorries through them.

The northern area was much more varied, with the undulations 133
sometimes forming distinct rises and dales. Hills, however, were still absent, although there were occasional outcrops of limestone and other rock. The soils were for the most part fairly firm, but sandy nevertheless, [134]
and damp below the surface. From time to time we crossed zones of purer loose sand, slightly raised above the surrounding country and known as dunes. A number of permanent waterholes, groups of large pans and a rainfall estimated to be about 20 inches a year (Department of Transport [132]
1953) made this area better watered than the Kalahari, and better wooded. 137x

There were more species of grass, and, particularly on the dunes, more of trees and shrubs. The fauna was also richer for there were buffalo and elephant and many waterfowl in addition to the animals found in the Kalahari.

. The Bushman languages represented in this paper are classified according to Bleek's *Comparative Vocabularies of Bushman Languages* (1929). They are !h3:, the closely interrelated ||ganakwe, |gikwe and Naron, and Auen (see also Bleek, 1928: 60-64).

!h3: is a member of the southern group, in which the lip click is found, and a dialect of what Bleek calls |nu||en, S6 in her system of classification. Bleek's spelling is !k3:, but I heard the click aspirated. It is spoken in the neighbourhood of Lehututu, which is 150 miles south of Ghanzi.

||ganakwe is spoken to the east of Ghanzi, and has been studied by Maingard (1957).

The centre of the |gikwe language appears to be in the country to the south-east of Ghanzi. It is a member of Bleek's Central group, closely allied to Naron and easily understood by Naron speakers although many words are different. A curious feature of the phonetics is the occurrence of the ejective lateral explosive followed immediately by the velar glottal affricate (see Cole, 1955: 23 and Beach 1938: 222-223). The first sound is not mentioned in any papers that I have seen on the Bushman languages.

Naron is Bleek's C2. There is an error which is liable to confuse one on page 3 of her publication, where the languages of the Naron and Masarwa of Tati have been transposed. Naron should be under C2 and the Masarwa language under C1. A grammatical sketch of Naron is given in Bleek's paper of 1928.

Auen, Bleek's N1, is the eastern form of the !khû linguistic group and is spoken round Gautscha Pan. It was studied by Maingard when he was a member of this same expedition and an account of it is given in his paper of 1957. In this paper I refer to it as Eastern !khû.

The work done in the Kalahari was done through interpreters, and much of that in the northern area likewise, except towards the end of the expedition when through closer contact with the Bushmen for a longer time than in the south, I was able to acquire a smattering of the Eastern !khû language, enough to ask straightforward questions and to understand straightforward replies. The phonetics of the Bushman languages are a study in themselves, and I do not claim that my spellings and indications of the tones are exact. In the orthography I have followed Bleek (1929) with the following exceptions:—

1. I have placed the n first when it is combined with a click. It has been the convention to place the n after the click in the written Khoisan languages, the argument being that the n and the click are pronounced simultaneously (Meinhof, 1909: 5). To my ear the n is the first sound in the combination.
2. Bleek does not mention the voiced h, which sometimes follows a nasalised click. I have accordingly followed Doke (1936: 448) and used the symbol ɦ.

For easy reference, the symbols I have used are listed at the end of this introductory chapter.

As the spellings of the Bushman names on my herbarium specimens are from field notes, they are often different from the spellings given in this paper, which was done after I had had the opportunity of consulting the authors I have mentioned. It will be noticed that many of the plants do not have the full set of Bushman names. The main reason is that we were not in contact with the Eastern !khû speakers until we had passed Ghanzi, and lost contact successively with the |gikwe, ||ganakwe and !h5: speakers as the expedition drew to a close. Other reasons are that my field notes were sometimes inadequate, that I forgot to ask, and that some plants appeared restricted to certain areas and were not known to all the groups of Bushmen. 128 [184]

As the expedition was during the winter when most of the plants were in poor condition, very little photography was done in the field. Most of the photographs are from plants which were sent back to Pretoria and cultivated there, or from plants which grow naturally in the Transvaal. In this paper the plants and photographs are arranged according to de Dalla Torre and Harms (1900-1907). Specimen numbers are in brackets. 126 [128]

There is little doubt that the plants discussed here represent only a fraction of those used, for we covered a very small part of the area over which the Bushmen range, and this when probably most of the annuals were dead, when some foods were out of season and when the above ground parts of many bulbous and tuberous plants had withered and disappeared so that the plants themselves could not be found. 114

Because of poor yield, poor quality, difficulty in harvesting or lack of flavour, not many of the Bushman food plants would be worth cultivating in their present form for the use of civilised people, but they offer a large field to the plant breeder. The most promising have been noted accordingly in the text. 000

There were few bones around the Bushman encampments, but this does not necessarily mean that there is a scarcity of meat in their diet, for the bones might have been removed by porcupines (Alexander, 1956; Dart, 1957) or eaten by hyaenas. A more reliable indication was the scantiness of the Bushmen's skin coverings. There are sharp frosts in the Kalahari and sometimes bitter winds, and one may argue that the Bushmen would provide themselves with sufficient skins if they had a regular supply of meat, although admittedly they eat skins after charring them on the coals and pounding them in a mortar. Vegetable refuse from former meals and fresh vegetable food, however, were found at all the Bushman encampments, and additional gatherings were the permanent chore of the women and children and of the men to a lesser degree. The insanitary condition of the surroundings also provided unmistakable evidence that the bulk of their food was of vegetable origin. 262 [291] [132] [364]

Their knowledge of field botany was astonishingly good. It has to be, otherwise they would have no chance of survival in their arid country. Fragments of stem, dead leaves, and other small clues of this nature, after being unerringly identified, were all the Bushmen needed to find many of the storage organs they were seeking. Differences which escaped me would enable them to distinguish between edible and harmful plants, and they had a thorough knowledge of the areas and habitats in which their food plants grew. They must have an influence on the distribution of plants. 824 137X

137 spreading some like the Grewias and the melons whose seeds pass through the alimentary canal apparently unharmed and reducing others like the Eulophias and Vignas which have edible underground storage organs. It is perhaps significant that, with two exceptions, the edible members of the family Asclepiadaceae were rarely found. In this paper there are 11, from Raphionacme to Fockea inclusive—nearly all important food plants with underground storage organs. The two commoner exceptions were *Sarcostemma viminale* which is sometimes poisonous and *Pentarrhinum insipidum* which has edible leaves and fruits but an inedible perennial root.

146 I am not qualified to speak on the health of the Bushmen, but it is apparent even to the layman that they are very unlikely to suffer from any deficiency disease while on their natural diet. When they are recruited for labour and fed on an unbalanced diet their health will be undermined and they will be less able to resist the rigours of their normal life when their contracts expire.

114 Their study by serious workers is to be encouraged for it should lead to their stability as a race and the enrichment of our knowledge, but contacts with irresponsible strangers is unfortunate and observations like the following by Brown (1954: 130) are valueless and regrettable:—

> "They are wonderful runners. When I chased one with the clanging of a bell he set off at a good bat into the distance, and kept it up until out of sight."

122 During the three months in which the field work was done, the expenses of my transport and keep were met from the funds of the expedition, and this I gratefully acknowledge. Dr. R. A. Dyer, Chief of the Division of Botany, gave me the opportunity of joining the expedition, and all facilities for working up the results of the field work. Most of the determinations were done by my colleagues in the Division of Botany, and of them Miss I. C. Verdoorn, author of *Edible Wild Fruits of the Transvaal*, read through the typescript and gave me valuable advice. Dr. L. E. Codd deserves special thanks for the way he saw to the growing of the considerable quantities of roots, bulbs and seeds sent from the Kalahari. 000 I thank Mr. L. K. Marshall, who led the expedition, and the members of it, [115] for their interest and kindness, also Kernel Ledimo, a fluent speaker of the Eastern !khũ language, who was always ready to translate or to pilot me through its little-known and fascinating grammar and phonetics. My notes on the Bushman languages were kindly checked by Prof. L. F. Maingard, and the ethnological literature was supplied mainly by Dr. N. J. van Warmelo of the Department of Native Affairs. I am indebted to Messrs. Midgeley, Martin and Scholtz of the Bechuanaland Administration for hospitality and for enabling me to see parts of the territory that I should not otherwise have seen. My thanks would not be complete without mention of the Bushmen whose knowledge is the foundation of this paper. [124] The information was seldom reluctantly given—usually cheerfully and with humour, and always with intelligence.

7:Story N-5 (1955) 1958 FX10 Bushmen FX10

ORTHOGRAPHY.

The following are the approximate values of the letters and symbols used in the spelling of the Bushman names. They have been taken from Bleek's paper of 1929, pages 12-14. 104 194

b, d, h, k, l, m, n, r, s, w, z — as in English.
k', t' — as above, but with glottal closure.
g — as in *get*.
j — as in *yet*.
k' — the velar glottal affricate.
x — as German *ch*.
ŋ — as in *sing*.
ʃ — as in *ship*.
ʒ — as in vision.
ṭ — the flapped retroflex consonant.
| — the dental click.
! — the palato-alveolar click.
‖ — the lateral click.
ǂ — the alveolar click.
⊙ — the lip click.
a: — as in *hard*.
a — the same sound shortened.
ɑ — the same sound produced far back in the throat.
e — as in *air*.
e: — as in *say*.
ɛ — as in *met*.
i — as in *hit*.
i: — as in *me*.
ɔ: — as in *haul*.
ɔ — the same sound shortened.
o — as in *notice*.
u — as in *put*.
ʔ — the glottal stop.
~ — over a letter denotes nasal pronunciation.
' — over a letter denotes accentuation of the syllable.

The middle tone is not marked, the high tone is marked by a dash above the line preceding the syllable, the low tone by one below the line, as ¯ha, ₋ha; rising and falling tones are marked ʼha and ˌha.

The voiced h is written ɦ.

7:Story N-5 (1955) 1958 FX10 Bushmen FX10

SYNOPSIS AND DESCRIPTIONS.

128 The synopsis is intended as a guide only, and leads to groups of plants and usually not to species. The descriptions and photographs should make the final identification possible, but it should be remembered that there are many Bushman food plants which were not seen on the expedition and which are therefore not described in this paper.

I have taken for granted that the reader will realise that the measurements of plants and their organs vary, and for this reason I have usually given what I consider to be the average and have omitted most words like "approximately" and "about".

Technical terms have been avoided except for the following:—

Axil of leaf—the angle between the leaf and the stem;
glabrous—without hairs;
glaucous—bluish-green, or covered with a bloom;
pappus—a tuft of hairs on a seed;
perianth—petals and sepals;
rhizome—an underground stem;
tomentum—dense short hairs;
tuber—a roundish succulent underground stem.

UNDERGROUND PARTS EDIBLE.

137 262 Trees or shrubs	*Bauhinia macrantha.* *Boscia albitrunca.* *Commiphora* spp.
Prostrate runners	*Bauhinia esculenta.* *Cucumis* sp.
Climbers or scramblers:—	
Scramblers	*Ipomoea verbascoidea.*
Twiners	*Ceropegia* spp.
With tendrils	*Coccinia* spp. *Corallocarpus welwitschii.*
Fleshy finger-like angled erect stems	*Caralluma knobelii.* *Duvalia polita.* *Stapelia kwebersis*
Without chlorophyll	*Hydnora* sp. *Terfezia* sp
Wiry 12" stems	*Ipomoea* sp. *Raphionacme burkei.*
Monocotyledons (strap-shaped or grass-like leaves):—	
Bulb with papery coverings	*Dipcadi* sp. *Moriscus congestus.* *Scilla* sp.
Rounded storage organ without papery coverings	*Eulophia* spp. *Walleria* sp.
Horizontal rhizome	*Sansevieria scabrifolia.* *Typha capensis.*

262

ABOVE-GROUND PARTS EDIBLE.

Trees shrubs or palms:—	
Thorny or spiny—	
Large fruits more than 1½" in diameter	*Hyphaene ventricosa.*
	Strychnos spp.
Small fruits less than 1½" in diameter	*Commiphora pyracanthoides.*
	Ximenia spp.
	Ziziphus mucronata.
Pods	*Acacia* spp.
Not thorny or spiny—	
Leaves compound—	
Stems more than 2' thick	*Adansonia digitata.*
	Ricinodendron rautanenii.
Stems less than 2' thick	*Burkea africana.*
	Lannea edulis.
	Rhus commiphoroides.
	Sclerocarya caffra.
Leaves simple—	
Fruits winged	*Combretum* spp.
	Terminalia sericea.
Fruits not winged—	
Leaves bilobed	*Bauhinia macrantha.*
Leaves not bilobed—	
Leaves hairy	*Dichapetalum cymosum.*
	Ehretia rigida.
	Grewia spp.
	Royena sericea.
	Strychnos cocculoides.
Leaves glabrous	*Boscia albitrunca.*
	Ochna pulchra.
Prostrate runners—	
Stems and leaves fleshy	*Talinum arnotii.*
Leaves bilobed	*Bauhinia esculenta.*
Fruits spiky	*Citrullus naudinianus.*
	Cucumis hookeri.
	Momordica balsamina.
Fruits smooth	*Citrullus vulgaris.*
Climbers or scramblers—	
No tendrils	*Pentarrhinum insipidum.*
	Pollichia campestris.
	Sarcostemma viminale.
Tendrils—	
Fruits spiky	*Cucumis metuliferus.*
	Momordica balsamina.
Fruits smooth	*Coccinia* spp.
	Corallocarpus spp.
Fleshy finger-like angled erect stems	*Caralluma knobelii.*
	Duvalia polita.
	Stapelia kwebensis.
Fleshy slender round erect stems	*Sarcostemma viminale.*
	Talinum arnotii.
Slender lax stems about 1' high	*Pollichia campestris.*
Stemless, with one soft leaf	*Ophioglossum sarcophyllum.*
Monocotyledons (strap-shaped leaves or fleshy leaves with spiny margin)	*Dipcadi* sp.
	Aloe spp.
	Typha capensis.

X137 *Terfezia* spp. (5031, 5616) Photograph 1.

Naron Bushman..... ˌku-tsʼi
Eastern ǂkhû Bushman ˌtsu-tsʼɔ

In size, shape and colour these truffles resemble potatoes, but the skin is rough and they are not as heavy.

The genus Terfezia, which is allied to the European truffles, has been recorded from dry and sandy localities between the northern Cape Province and the Mediterranean region. There are 36 species, of which three are believed to occur in South West Africa and the Union. Some records are vague and incomplete, and cannot be checked. These southern species, all of which are edible, are not distinguishable except by microscopical examination. They may be found from April onwards to about July, when the season ends presumably through their disintergrating in the soil. Their presence depends upon the rainfall, as is shown by the following extract from a letter from Mr. G. Scholtz, of Ghanzi, whom I had asked to collect some for me. "Nature appears to be against you this year. I even offered five shillings per truffle, but according to the Bushmen (my offer was just laughed at) no rain, no truffles. And we certainly have had no rain, in fact the worst drought in Ghanzi's history."

It is uncertain whether they are root parasites or mycorrhizal fungi, and nothing definite is known as to the host plant favoured by any particular species. In the south-western Kalahari, near the Kalahari Gemsbok National Park, they are found in the dips between the sand dunes where *Aristida ciliata* is the dominant grass, but it has not yet been established whether they are connected with it or with some associated plant. Towards the Ghanzi area they were collected in a mixed grassveld of Aristida and Eragrostis species with scattered trees of *Acacia uncinata* and no *Aristida ciliata;* but here another species may have been involved.

222 The European truffles are usually collected with the aid of dogs or pigs, which can trace them by their scent, and rarely by two other methods. One of these is by observing where certain insects collect to lay their eggs, for their larvae feed on truffles and the eggs are laid near them. The other is to watch for cracks in the ground which the truffle sometimes causes as it grows. This is the method used in southern Africa. A good deal of practice is needed before it can be applied, for the cracks are slight, and are specially difficult to find where the surface has been disturbed by game or stock, or where they have been partly filled in by windblown sand, but matters are eased somewhat by the fact that there is seldom more than about three inches of sand covering the truffles and that they grow in patches.

252 They may be eaten boiled or roasted. The texture is like soft cheese.
262 They are not aromatic and the flavour is far inferior to that of the best European truffles.

Ophioglossum sarcophyllum Desv. (5142) Photograph 2.

X137 This unusual looking plant is one of the ferns. It is five inches high on the average, and somewhat fleshy, and consists of an erect stalk with a leaf-like undivided frond at the top. A thinner stalk which bears the spores rises from the mid-rib near the base of this frond.

A few specimens were collected at Gam, on damp sand which was moist from the run-off from adjacent rock outcrops. It is usually found in places like this, where the dampness is conserved, but after good rains its distribution is not restricted, except that it occurs more in the open and does not grow under dense bush. In favourable localities it is sometimes massed, and may be collected in quantity. It occurs throughout southern Africa. 137X

It is used by various Native tribes as a spinach, and may also be eaten raw. It tastes like lettuce but is slightly sweeter and lacks the crisp texture of lettuce. 262

Typha capensis Rohr. (5302) Photograph 3.

Eastern !khû Bushman dza-dza

A cosmopolitan and well-known plant, known in South Africa as the bull-rush, and easily recognisable from its inflorescence which forms a compact brown spike two feet or more in length at the tops of the five-foot flowering culms. This is in two parts, variously divided so that the lower may be equal to the upper, or shorter, or longer. The lower part consists of the female flowers and is sausage-shaped and brown, with the flowering culm running through its centre. Immediately above this is a spike of male flowers, similar except that it is more open and often yellowish from the masses of pollen it contains. The leaves are strap-shaped, usually an inch wide and six feet long, erect and fairly rigid and very slightly twisted along their length. It is a gregarious plant and always grows near water. 137X

A little was growing round a permanent spring at the edge of Gautscha Pan, and was the only patch seen during the trip.

The top (male) part of the inflorescence is eaten raw by the Bushmen. It has the rich and familiar flavour of bee-bread. Dinter (1912:17) states that the rhizome of this plant is the thickness of one's finger and about two feet long, and may after drying and husking be beaten to a reddish meal which is rich in starch and may be used in the same way as meal from cereals. I have tried the rhizome myself. It is heavy and succulent when fresh, and loses water slowly. When dry it has a puffy outer zone of tissue which may be stripped off to expose a hard central cylinder containing the reddish starch to which Dinter refers. As the starch does not crumble readily it is difficult to beat out, and it is full of fibres which may however easily be removed by sifting. It may be boiled to make a brown porridge of good quality except that it is more glutinous than any porridge normally used by us. 252 262

Naron Bushman..... nlani
Eastern !khû Bushman !gewu

This plant is one of the sedges, a group closely related and similar to the grasses but distinguishable by certain rather subtle differences which most laymen as well as botanists are familiar with. One of the main ones is that their flowering stalks are usually three-angled and solid while those of the grasses are usually round and hollow. The species in question could not, in its withered winter condition, be named in the field, but bulbs which were collected grew well in cultivation and flowered in Pretoria that same

X137 year. They produce an erect and robust plant with bright green leaves and numerous spreading underground rhizomes on which more bulbs are borne a few inches below the surface. Some stolons are produced above ground as well, from among the leaves. They afterwards turn downwards, entering the soil close to the parent plant and thereafter behaving in all respects like the rhizomes. The flowering stalk is three-angled and unjointed, with a cluster of compact, spiky inflorescences at the top, some on slender secondary stalks and some almost sessile. The parent plant is in a sense annual, for both it and the bulb producing it wither at the onset of winter, but the fresh bulbs which have been produced form new plants, and the species is capable of spreading very rapidly by this means. The bulbs are rounded, half an inch in diameter with a sharp point at the top, and covered with several papery brown layers which may be removed to expose a pale nut-like body.

Sedges usually favour damp places, but this species seemed equally at home in seepy areas and well-drained ones, and in the sandy country near Nama Pan it was common nearly everywhere, sometimes scattered among the grasses but more often in patches. Its range is from Cape Town to the Mediterranean, and it occurs in Australia also.

262 The bulbs are edible, and seemed to be a fairly important food of the northern Bushmen. The taste is sweetish and they have a crisp tex-
252 ture and a cloudy, very slightly astringent juice. Light roasting improves
222 the flavour. They are easily gathered by scratching away the top layer of soil, and their presence is often shown by the disturbed soil where they grow, for they are a favourite food with many birds and small animals, which scratch and burrow to find them. According to the *Flora Capensis* the plant " has been for nearly a century cultivated in Europe ".

X137 *Hyphaene ventricosa* Kirk (5301).

Eastern !khû Bushman !hani and !heni

This palm is bushy when young, but loses its bushy habit as it matures, forming a long clean stem 40 feet in height with a crown of leaves at the top and often with a slight swelling near the middle. The leaf has a strong woody rhachis up to six feet long, slightly hollowed above and rounded below, with a row of sharp hooked spines at intervals of an inch or so along each margin. At its tip it bears the leafy part which is two feet across and folded like a fan. The fruits, a little smaller than a tennis-ball, are covered with a glossy brown papery skin, and are borne in clusters.

Old an half-decayed fruits were found in the neighbourhood of Nama Pan, presumably where they had been discarded by Bushmen, but the palm trees themselves were not seen in this area. Only one specimen was found, 20 miles to the north-east. It was immature and had neither flowers nor fruits. According to available records, it was growing near the southern limit of its range, which extends to northern Rhodesia and the Belgian Congo.

262 There is a quarter-inch edible mealy layer immediately underlying the
114 skin of the fruit. It is fibrous and dry but sweetish, with a pleasant flavour, and may be gnawed off the hard inner shell into which it merges.
[272] The kernel in the centre of the mature fruit is hard and bony and inedible,
[252] but Chapman (1868 : II : 73) states that the milk of the young fruit may be used like that of the coconut, and that the whole of the young fruit may " be EATEN AFTER BOILING, "PULP, RIND, AND ALL.

be eaten after boiling, "pulp, rind and all". Dinter (1912:21-22) says also that the Bushmen use the heart of the palm as a green vegetable, and that a sweet sap may be tapped from the upper part of the stem and fermented to make an alcoholic drink. He gives the yield of fruits from one palm as between 20 and 50 kilograms (48 to 120 lb.). His reference to the heart of the palm is obscure, but Chapman (1868:I:55-56), who is more explicit, says that this is the core of the young trunk. 262 114 [273]

Aloe rubrolutea Schinz (5135). 137X

Eastern !khû Bushman n||ɔru

This species was in full bloom in early August, and made a striking show with its spikes of brick-red flowers. The plants formed rosettes of leaves 12 inches across, producing a slender erect five-foot flowering stalk. Among the hundreds of speciments seen there were none arborescent, although elsewhere arborescent forms are common (Reynolds 1950: 328). Those seen at Nama Pan were similar in habit to *Aloe zebrina*.

Aloe rubrolutea was seen only on the rocky outcrops near Nama Pan and Gam, growing in patches of an acre or so, but it has a wide distribution extending from South West Africa through the Bechuanaland Protectorate to the northern Transvaal and Portuguese East Africa.

The flowers are stripped off the flowering stalk and pounded to make a spinach-like vegetable. Although the Bushmen said that they did not eat the leaves, they were tasted raw and boiled and were found to be juicy and not unpleasant, and to have no harmful effects. They would be a good source of water in an emergency. 252 262

Aloe zebrina Bak. (4995). 137X

!hɔ: Bushman..... !ganja
!ganakwe Bushman n||ɔru
!gikwe Bushman... n||uru
Naron Bushman... n||ɔru

The plant forms a rosette of rigid dark green leaves which have pale transverse bands and numerous sharp teeth along the margins. It may have a stem 30 centimetres long (Reynolds, 1950: 282), but those seen on the expedition were stemless. The flowering stalks were three or four feet high. The sap in the epidermis of the leaves is greenish-yellow. It oozes out of the vessels fairly quickly if a leaf is cut across, and hardens and changes colour on exposure to the air, becoming brown and glassy. The bulk of the sap, which is in the inner part of the leaf, is colourless and translucent, and does not ooze out if the leaf is cut.

Only one small clump of this Aloe was seen, on deep sand about 80 miles directly south-east of Ghanzi. It is, however, recorded from Angola and South West Africa and across the continent to the east.

The Bushmen stated that the leaves were a good source of water. One of these plants was sent to Pretoria and grew well in cultivation. On being tested, the leaves proved extremely unpleasant, not because of any bad taste but because their sap is in the form of a thick, revolting slime. Boiling or roasting did nothing towards making them more palatable. Either the Bushmen were confusing this Aloe with another species, or it 262 312 824

262 271 824 [114] is eaten only when they are in the greatest need. Reynolds (1950: 285), quoting W. B. Hooker, states that its flowers may be eaten after boiling, but I did not think of asking the Bushmen about this and they did not volunteer any information.

X137 *Dipcadi* sp. (5163, 5307).

!h5: Bushman..... n!ɔm
Naron Bushman..... n!ɔm
Eastern !khû Bushman n!umʃé:

Although the above-ground parts had been killed by frost, enough remained for the plant to be identified as a species of Dipcadi. The bulbs were two inches below the surface of the soil, in appearance like a small onion. They were planted in Pretoria, but although they were still alive two years after being collected, they had failed to produce leaves or flowers up to the time this report was written.

Specimens were collected at Nama Pan, in parkland on sandy soil. As the plant was recognised and named by one of the southern !h5: Bushmen who was with us, it probably extends into the Kalahari well south of Ghanzi.

[262] The bulbs are edible after cooking.

Scilla sp. near *Scilla lancifolia* Bak. (5190) Photograph 5.

Eastern !khû Bushman tû

This plant has a rounded two-inch bulb covered with a thick layer of dark brown papery scales. In the summer it produces three or four spreading leaves, usually six inches long but up to 10, and one and a half inches wide at the widest part. They are thin but fleshy, strap-shaped (but in section widely V-shaped near the base), and light green, sometimes faintly mottled with darker green. The inflorescence is four inches long and the flowers small and not conspicuous, with purple stamens and a recurved perianth.

It was common in shallow sand overlying rock near Gautscha Pan and Nama Pan but was not easy to find because the leaves and inflorescences had been frosted, and blown away by the wind by the time the expedition had reached those parts. A number of bulbs collected there produced leaves and flowers in Pretoria the following summer, and it was from these plants that the notes were made.

[252 262] The bulb is edible after roasting but I have not tried it personally.
